SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," 11/12, Second Line Beach, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 11 and 12, Second Line Beach, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 8th July, 1898.

Season Reports should be sent to the Printers, Messrs. ADDISON & Co., direct, and not to *Planting Opinion* Office.

Upper India. The season is still a late one in Assam, but tea-pests seem a little better than usual. Cachar is also behind-hand in its outturn. Darjeeling is picking up again, but, like the other districts, is in need of a lot more rain. Calcutta prices have set in very low all round, and things are looking blue all round.

Nilgiris. COONOOR, 29*th June.*—*Weather.*—A fair but very local shower last week put its lucky recipients into good spirits; but, speaking generally, rain is very badly needed, especially for coffee, as a good deal of the young crop is dropping. *Crops.*—Tea is picking up a little, but wants rain badly too; the tea-crop will be a very short one this year. *General Health.*—General health is still bad.

Coorg. POLLIBETTA, 28*th June.*—*Weather.*—Break continues. No rain during the past two days. Rather clear and chill to-night. *Crops.*—Weather has been excellent for bringing on the crop, which is now showing up nicely. Probably estimates will be slightly exceeded. *Labour.*—Coming in slowly; but estates fairly well supplied. *Health.*—Good.

Nellampatty (British). 29*th June.*—*Weather.*—Rain for fortnight 10·88, to date 36 ins. For last week there has been a pleasant little break, which still continues, though I fear it won't last long, as clouds are banking up and it looks very threatening again. *Plant-diseases.*—A little "leaf" showing in nursery here, but coffee in general still looks very fit. A great many plants in clearings have been attacked by ringer and a good deal of danger done. *General Health.*—Very bad still; great deal of sickness among

coolies and little improvement among ourselves. *Labour.*—Nearly all in: Moplahs seem to be finding work nearer home, as none have appeared this year yet.

ENSILAGE-MAKING.

THE South-West Monsoon is the season, in the majority of South Indian planting districts, when the growth of grass and fodder is most abundant. Yet a few short months after the rains have ceased, fodder of any sort for estate cattle is very scarce, and by the middle of the hot weather is almost unobtainable.

To preserve what is required out of this overflowing monsoon abundance is one of the easiest things in the world. To understand its neglect is to understand the reason of the despair of progressive agriculturists at the astounding apathy of the bucolic mind. If in the intelligent and generally resourceful planting community such matters as the preservation of fodder are neglected, the sullen indifference of the Indian ryot to the best-meant intentions of Government is not to be wondered at.

To return to our muttons. There is only one time of preserving natural grass, and that is in the monsoon, for it seeds at that season, and a seeded grass is almost valueless. And of methods of preservation there is only one: to make ensilage of it. The process of ensilage-making dates from ages long past. It is simple, inexpensive and most efficacious. It consists of placing the cut green grass in pits or masonry chambers, so that air and outside moisture are excluded. The temperature, under these conditions, rises to 80 to 100° Fahrenheit, and fermentation ensues with the formation of several acids, acetic and lactic acid, &c., which preserve the fodder. If, on the other hand, the atmosphere is more or less admitted, moulds form, and oxidation and putrefaction take place.

The simplest form of ensilage-pit or soils is a pit in the ground, choosing as site a position with good natural drainage. The size of the pit may be almost anything,—from 10 × 8 × 5 feet deep to 30 × 12 × 6 feet deep. It is not absolutely necessary to line them with masonry. But a cheap form of roof, thatch or any other convenient material, would be desirable, as also a shallow drain to carry off roof and surface water. The size of the pit depends, of course, on the quantity of cattle to be provided for, and the work required for them. If the ensilage is made from grass at or just before flowering time, 16,000lbs. of grass would suffice for a pair of working bullocks for six months. This would give them a ration of 60lbs. of ensilage a day, equivalent to 90lbs. of grass, for there is always a substantial loss in the food value of grass on conversion into ensilage. A pit large enough to receive these 16,000lbs. of grass would have to be 10 × 10 × 5 feet deep, or 500 cubic capacity. For ordinary estate cattle, whose sole function is to produce manure, the contents of such a pit would probably suffice for three if not four head. The cost for pitting may be put down at anything from 8 annas to two rupees per 500 cubic feet, according to the nature of the soil. The roofing would not cost more. Lastly comes the question of cutting the grass. This depends muchly on the supply, a cooly cutting from ten to thirty 100lb. bundles of grass per day. The cost would thus vary from one rupee four annas to four rupe per pit of above-named dimensions. The quicker t grass is filled in the better; and as soon as filled, the should be covered over with the earth taken from the and roughly thatched over to keep the rain out.

For estate manure cattle the cost of providing ensila for the six drier months of the year may, therefore, be rec oned at from nine annas to two rupees per head, or one an three pie to five annas five pie per head per month. N a very large sum this, when it is remembered what intimate connection large herds of cattle have on t fertility of an estate. An average cow or bullock in f health, and provided with sufficiency of fodder, will gi sixteen or more bushels of manure a month, the value which varies from one anna to four annas a bushel. the dry weather, with insufficient fodder, the supply manure decreases to about one-half, and the quality usually wretched. So that it does not take any ve elaborate calculations to prove the extent of the benef derived from an intelligent use of ensilage pits. At lea double the number of head of cattle could be carried wi safety, and, in some cases, treble.

NOTES.

Perfume-making. We reprint elsewhere a very inte esting description of the proce of perfume-making, which is really simple enough f almost anyone to attempt. Involving no hard work, b only patience and watchfulness, the distilling of essent oils is particularly adapted to the conditions of plan tion life.

Mange cure. The following is culled from Australian contemporary:—Boil linseed oil, sulphur and kerosine, equal parts. First m the oil and sulphur, then add the kerosine and mix wo Applied with a hard stubby brush. A tea-spoonful carbolic acid to a pint of lard, stirred in and well mix is also a good remedy.

Ceara Rubber. The *Madras Times* remarks:—

> In continuation of our article on Ceara rubber cultivation in Ind it is of interest to note that the price of crude rubber has advan 30 per cent. in England during the past six months. It needs imagination to see what a boon to the Forest Department, and our sadly-depleted revenues, a thorough success in rubber growing, it in Assam, or the Terai—the two most favourable regions—or Madras, would be. Forests, however, are not grown lightly.

London purple on white ants. Either of the two famous arseni preparations known as London pur or Paris green act effectively agai the white-ant pest. When the ants occur in walls, on t floor of buildings, on tennis-courts or such places, t stronger the solution the better, but care must be exercis in using the poison in the neighbourhood of plants.

Tropical fruits on plantations. In a letter recently address to the Nilgiri-Agri-Horticultu Society, General Morgan sensi recommended that tropical fruits grown on the slopes of t

Nilgiris should be more especially recognised in the fruit prize list of the shows. The Society should certainly devote more of its energies to the economic side of its shows. Such Society functions as flower shows are all very well in its way, but if the N.A.S. wishes to gain the general support of the agri-horticultural public, it must go to work in a very different way.

Papaws. Few are aware that there is more than one kind of papaw in cultivation, yet there are three distinct varieties. Two of these produce huge fruits weighing up to 9lbs. each. The Singapore variety is not as large, but has a fine flavour, and turns golden when ripe. It does not, says an exchange, appear necessary to keep male trees in gardens, and these are generally destroyed, but sometimes these unsatisfactory specimens are tapped—the operation requiring, as a rule, to be repeated often—till they become transformed into good fruiting trees. Papaw trees may be dicœcious, monœcious, and even hermaphrodite.

Cheap motors. The latest fairy tale of science is that a syndicate has been formed to acquire certain inventions for generating electricity by air. The discovery, if reports are to be relied upon, is one of the most important and far-reaching of the century. With a small apparatus, weighing only a few pounds, and without the aid of gas, or steam power, or dynamo, sufficient current can be generated for lighting any ordinary dwelling-house. Experiments conducted over a period of some months are said to show that very striking results can be obtained by this method, and that the current developed remains quite constant.

Pine-apple plantations. The enticing figures of the profits made from fruit cultivation in the West Indies would makes one's mouth water, if the disastrous effects of the decadence of the sugar industry in those islands were not so prominently before the public. For if fruit gardens are so extremely profitable, as newspaper clippings would have us believe, what is the need of the proposed grant-in-aid to the distressed local planters?

But some of the figures given in connection with pine-apple plantations in Jamaica are surely tempting enough to encourage some South Indian Planter to attempt to follow the example. Three hundred pounds sterling per annum from a six-acre pine-apple patch!

Bamboo scaffolding. A French Consul in the Netherlands Indies lays stress on the importance of bamboo as adapted for constructing builders' scaffoldings, and he states that in Japan even a lighthouse has been built with its help. It presents for this purpose perfectly ready-made poles of great length and lightness, which, combined with thinness, possess a much greater power of resistance than any other wood. The power of resistance of a bamboo cane measuring eight to ten inches in diameter, even with a length of sixty-five feet, is enormous. Moreover, bamboo does not rot, either when in the ground or in water; whilst the drier and older it grows, the firmer it becomes.

Indian arrow-root. Though Indian arrow-root commands but a very low price in the London market, it would be well worth while, writes a correspondent to an exchange, to experiment with the best tubers from the West Indies, and ascertain whether we could not successfully compete with the finest St. Vincent, which is quoted at 10*d.* to 1*s.* per lb. The process of preparing this farina is so simple and inexpensive that if we could obtain the prices above mentioned, arrow-root would pay better than tea. Where the West Indian planter has the pull over many of his East Indian rivals lies in his proximity to the coast. Tapioca does not afford the same inducement, its value being much lower, but still it might be made to contribute its quota to the general revenue of an estate.

Lemon-grass oil. Adulteration of this oil continues. Referring to the article by Mr. J. C. Umney in the *Chemist and Druggist* of December 18, 1897, a German firm of distillers confirm the observations therein recorded, and state that three kinds of oil may be met with in the market,—(*a*) natural lemon-grass oil, sp. gr. 0·9041, optical rotation—3 18°, and solubility in 70-per-cent. alcohol, 1 in 3; (*b*) oil deprived of citral, sp. gr. 0·9102, which is insoluble in 70-per-cent. alcohol, and, being heavier than that solvent, sinks in it; (*c*) lemon-grass oil adulterated with oil of lemon, sp. gr. 0·8886, optical rotation÷18 20°, insoluble in and swims upon 70-per-cent. alcohol. We also learn that *Andropogon citratus D.C.*, the plant from which lemon-grass oil is distilled, is now grown at St. Thomas in Portuguese West Africa, and the oil distilled from it agrees in physical characteristics with East Indian oil, but it is optically inactive. In our report of March 5 we mentioned the importation by Mr. Schlesinger of Tonkin verbena oil. This has now been chemically examined, and found to contain 70 per cent. of citral.

Pulping fruit. The following method of pulping fruit in Mildura, where apricots and peaches are the principal fruits used, may be of interest to those of our readers who are anxious to find a use for their superfluous fruit, viz.:—The fruit is first pitted and put into a copper or cauldron, and a little water added (proportion—gallon of water to 3 cwt. of fruit). It is then boiled for twenty minutes (*i.e.*, twenty minutes from the time it starts boiling). Unripe fruit will require a little longer, and should the fruit be watery, it can be cooked without adding water. When first put it is stirred constantly to keep it from burning. After cooking it is put into tins and the tins soldered whilst hot. Occasionally the fruit is cooked in the tins, and when this is done, the tins, after being filled and closed, are punctured and immersed in water to within, say, two inches of the top, or just so that the water will not boil over the top of the tin and get into the punctured hole. The fruit is cooked for twenty minutes, as explained, and the hot air is blown off through the hole. As soon as cooked the tins are sealed. Ten-pound tins are the best when the fruit is cooked in this way, as the re-action draws in and disfigures larger ones. The fruit done in tins is not pulped or mashed to the same extent as that which is boiled and stirred in the cauldron.

Coffee in Java. The decline in coffee prices, encouraged as it is by the great fall in the Brazilian exchange, appears to be having a very

adverse influence on coffee-planting interests in Java, says the *H. and C. Mail.* A stage of depression there, it is stated, has now been reached which justifies fears of the worst. It is reported that many estates there are to be "shut down." The position is said to be most unsatisfactory in Cotie—Dutch East Borneo—where the suitableness of the soil and climate to the cultivation of Liberian coffee led planters to open up estates very eagerly. Prices, especially for the Liberian description, have, however, fallen so low, and coffee growing in Brazil has been so extended, that all hopes of financial success in Cotie have now, it is stated, been abandoned. Only a year ago nineteen concessions for coffee planting in Cotie were applied for, but the outlook is at present so discouraging that all these applications will be allowed to fall through. Many coffee estates in Java also are reported to be in difficulties, and four are mentioned, valued in 1896 at 1,400,000 guilders, which are now in the hands of mortgagees, who intend to sell them by auction. It is added that the estates have, as a rule, been worked on so unsatisfactory a system that no provision has been made for bad years such as are now being experienced, planting companies having trusted to a continuance of the brilliant results at first attained.

Antiquity of vegetables.

Some of our most common vegetables seem to have come to us from a time that is immemorial. Asparagus was in use 200 years before the birth of Christ. According to Herodotus, lettuce was in use even earlier than asparagus, for it was cultivated as early as 550 B.C. Not only was it grown, but it was so grown as to be had at all times of the year, and even blanched to make it white and tender. What better does the gardener of to-day? The cucumber is one of the vegetables named in early Bible history, though some claim that melons were really meant. As to the melon, the date of its first cultivation is lost in antiquity, but Pliny records its use, and, as he died in A.D. 79, it probably is as old as the cucumber. Carrots and turnips were in use as garden vegetables before the Christian era. No one seems to have been able to trace the origin of either the pumpkin or the squash, but we read that pumpkin pies were made more than 300 years ago after this recipe: Cut hole in the side, take out the seeds and filaments, stuff with a mixture of apples and spices, and then bake till done. The ancient Greeks used to offer turnips, beets and radishes in their obligations to Apollo. The first they offered in dishes of lead, and the second in silver, but the third was offered in "vessels of beaten gold." Parsnips we find mentioned by Pliny as being brought to Rome from the banks of the Rhine at the command of Emperor Tiberius for use on his table.

The Ooty Botanical Gardens.

A correspondent wishes us to agitate that something more be done with the Government Gardens so that planters can get a larger supply of economic plants. We have written so strongly and so often on this very subject, that we must now leave the matter in the hands of planters themselves. It is altogether difficult to understand why the local Planters' Association has not taken it up before now. Let them plainly understand that Government, like higher powers, helps those that help themselves. Were planters to address His Excellency the Governor on the subject, we have not the least doubt that they wou meet with a favourable answer. But until they take t trouble to do so, it is not to be expected that Sir Arth Havelock will be at the pains to divine their collectiv dumb wishes.

The present Curator of the Botanical Gardens, Mr. R. Proudlock, exhibits the greatest interest in the econon side of his department. He has just now a large numb of valuable Para rubber plants for sale, grown from se collected at Burliar, besides ipecacuanha, coca and oth valuable plants. Being a Government servant, with certa other and very onerous duties to perform, he has little ti to spare for such work. And until public interest is unm takably shown in such work, it is not likely that Governme would wish him to devote his energies to what they m think a useless branch of his duties. We can assure c readers, however, that if any general movement is start in the direction indicated, we shall afford it our very hea support.

Ipecacuanha.

The source of supply of this dr is at present the rather limited ar of the plateau of Matto Grosso, west of the Paraguay riv near the western border of Brazil, and in the extre N.W.W. of Rio de Janeiro. Although the ipecacuan plant is said to grow over "a very wide extent of territor in Brazil, the collection is confined to the small pat The demand for india-rubber is drawing off the labour fr ipecacuanha-gathering. The cost of the drug to t merchant in Cuiaba is by no means trivial, for he mu spend at least 3*s.* per lb. before he gets the supply into yard and ready for despatch to the coast. A return cheap prices—say, 6*s.* per lb. in Mincing Lane—seems ve remote, says the *Chemist and Druggist.* And herein lies t planter's opportunity. Plants can be obtained in limit numbers from the Government Burliar Garden (Nilgiri and indeed is already being largely tried in the Annamala It may be as well to remind our readers of the growth a cultivation of the plant. It is a tiny shrub or plant so six inches high. It should be planted in a warm, moi sheltered position under high shade. The soil must be ri free and open. Planted in well-prepared beds six inc apart, the roots soon develop, and in a couple of years less are fit to gather. The plant is pulled up by hand, t roots broken off, and the stem replanted in the grou The money yield of an acre of ipecacuanha is so fabulou great that we refrain from mentioning figures: it will suff to say that coffee or tea even in their best days pale bef it. The only reasons for its cultivation not being extend at once on a very large scale are simply these: firstly, th ninety-nine out of a hundred planters are blissfully ignora of its possibilities; secondly, that the supply of plants still small; thirdly, that a well-grounded fear exists tha large area in cultivation would infallibly mean a crushi fall in prices.

Garden rows.

A correspondent to the Calcu *Planter* wants to know if the feeli of "unrest" which is prevalent in Bengal has a mysterious connection with the decided symptoms unrest exhibited by garden coolies in various directio lately. There have been an unusual number of gard

rows this year, and a decidedly unwholesome lot of cases of sahibs getting a mauling, or having to exhibit a very clean pair of heels, and make a record sprint for the bungalow to avoid it. One or two of these disturbances may be attributed to injudicious interference with the coolies at their annual saturnalia, the "Phagua" time, when they are all blind-drunk. But granting that at least two of these recent rows were the results of a Phagua drunk, the others were not; and even a Phagua drunk is no excuse for a band of *badmash* coolies laying out their manager, or trying to carve slices off him with hoes and such like things. The planter has law enough slung at him when he is run in for hitting a cooly. However aggravating and assault-provoking Mr. Coolie may have been, we must not take the law into our own hands. Surely, when the process is reversed, and the cooly "licks" the planter,—which process necessarily involves combined action and more or less of a riot, for the average planter doesn't take a "licking" from one man—it should be very severely impressed on him that *he* also must not take the law into his own hands. In one recent case, where the coolies actually thrashed the chota sahib, struck work, opposed the first (local) police force—(the average Assamese head constable and a couple of bobbies, I suppose) sent to restore order,—and eventually had to be straightened out by the Deputy Commissioner personally, accompanied by a force of frontier police, I am told that the ringleaders were simply warned, discharged, and told to be good and go to work again. But I can hardly believe this.

Coffee in the Shire. Coffee is beginning to show signs of ripening in the earliest districts, writes one of the last numbers of the *Central African Times*, and planters have now got a fair idea of what their outturn is likely to be. As was to be expected after the severest drought to which the industry has yet been subjected, the total output for the present year is likely to be less than the total crop of last year. Our highest estimate for the present crop puts it down at 6,600 cwts., or 330 tons, but we are inclined to think it will not exceed 6,000 cwts. The total last year was 7,600 cwts., or 380 tons. Had the past season been a normal one, there is little doubt that the present crop would have been more nearly 500 tons; the drought in fact has occasioned a loss of over two hundred tons. This is pretty severe on a new industry, but as has been pointed out before it is not likely to recur again, and the rainless condition was characteristic of South Africa generally, where such a dry season has not been known for over twenty years. The bushes have recovered splendidly from the effects of the drought, and all being well next year should see another record output. The lesson of the drought is to redouble our efforts to conserve moisture by tillage and shade. The present is the time to give the whole estate a light trenching over before the sun has time to rob us of any large proportion of the late rains. By keeping the top three inches in a fine state of tilth and never allowing it to cake, the maximum amount of moisture will be conserved. With reference to the coming crop, it cannot be too strongly impressed upon our minds that the curing is all-important at the present time. Only satisfactory prices will be realised by the finest grades, and it ought to be our endeavour to send home only the best coffee, cured with the utmost care, and picked over thoroughly to try and remove all defective beans and the oft-complained of "stinkers." Prices are still good for the finest grades, but the market is weak for all inferior sorts.

Timber plantations. Most plantations have considerable areas of reserve third-rate jungle, composed usually of poor scrub and indifferent jungle trees. It has not crossed the minds of their owners that the value of these reserve lands might be very considerably increased at a very small outlay by sowing them with the seed of valuable timber or fruit trees. Planting by means of pits is usually an expensive operation if over large areas. But there are cheaper ways by far and just as efficacious. The land could be cleared by giving it over to the local tribes, such as Kurumbers, Irulars, Badagas and so on, for their cultivation for a term of, say, three or four years. At the sowing time of their crop, the seed should be handed them for sowing with their own seed, broadcast or else in lines of a few feet apart. A few pice should be promised them for every three-years old plant, healthy plant growing on the land after the expiry of their contract. By that time the plants would be large enough to overcome any competition from the self-sown jungle. Large areas could be planted up in this manner with the minimum of expense. Of suitable trees there is great variety. If near the coast or railway, timber trees might prove profitable; even fuel under certain circumstances would pay, especially if the reserves in question were attached to a tea-plantation. Rubber trees again of all varieties, even such comparatively valueless kinds as Ceara, could be raised. Provided communications were good, the hardier kinds of fruit trees would be specially suitable. Or, if it were deemed unadvisable to indulge in such haphazard planting of remunerative trees, there would be an undoubted gain in sowing thornless leguminous jungle trees and shrubs, seed of which is always procurable in abundance. Half a dozen or more years of leguminous jungle growth would convert the valueless reserve into land capable of growing almost any crop that might be planted hereafter.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

How to treat bones. The following information regarding farm methods of treating bones, where no crushing-mill is available, has been furnished, in reply to a query from one of our correspondents, by Mr. A. N. Pearson, Government Agricultural Chemist, Victoria :—

Bones in country districts, where crushing-mills are not available, may be reduced by means of caustic lye, quicklime, or freshly-calcined wood ashes.

A simple plan is to pack the bones layer by layer, with freshly calcined wood ashes, in a barrel, and keep the mixture moistened for some months. Casks may be kept in constant use for this purpose on a farm, receiving every few days a fresh layer of bones and of ashes.

A quicker method is to boil the bones in an iron or copper boiler together with strong caustic lye. The proportions of bones and lye to be used are exact or not invariable. Roughly speaking, five parts by weight of caustic soda, or seven parts by weight of caustic potash, dissolved in 15 parts by weight of water, should disintegrate about 15 parts by weight of bones by two or three hours' boiling.

If the bones be allowed to remain in the caustic liquor, even without boiling, they will, in the course of a week or so, become disintegrated.

Another method of softening bones is by mixing in heaps with quicklime and loam. A layer of loam 4-in. deep is made, and on this is placed a layer about 6-in. deep of bones, and above this a layer 3-in. deep of quicklime. The layers of loam, bones, and lime are repeated in succession until the heap reaches a convenient height, when it is finally covered with a thick layer of earth. Holes are then bored in the heap from the top and water poured down them to slake the lime. The mass will become hot, and remain so for two or three months, after which the bones will be friable, and the whole heap may be mixed up, and is all ready for the ground.

Nutmegs. The cultivation of nutmegs is one of the simplest forms of tropical agriculture. It grows well at the best coffee elevations, but demands more moisture than, and as good a soil as, the berry. If the soil is very good, deep, and well drained, and the position a sheltered one, they may be planted 25 feet apart each way with advantage. If the soil is poor, they may be as close as 20 feet. To make perfectly certain of getting female or bearing plants in each pit, three seeds are usually planted in each pit. All male trees, save one or so, should be destroyed. Only one female tree should be left to each hole, the rest transplanted at one year old or destroyed.

As nutmegs take as long as twenty years to get into full bearing (though of course they begin to crop a great deal sooner), it is essential that some such staple as cacao, coffee, cassava, plantains, etc., should be grown as a catch crop. As the nutmeg trees expand in size, the other crop should be gradually removed, branch by branch, so as not to waste any crop. A good-bearing nutmeg tree is averaged to yield £5 per acre, but on a large acreage the yields are considerably smaller. If in a good situation, however, £50 to £100 per acre may be safely reckoned on, the expenses up to port of shipment averaging about 12 per cent. only of the gross returns. The best and largest nuts sell at from 2*s.* to 3*s.* 6*d.* per lb.; the intermediate and long-size ones vary from 10*d.* to 2*s.* per lb., while the worm-eat and rotten ones fetch from 4¼*d.* to 8*d.* per lb. Mace, whi is also a product of the fruit, sells from 1*s.* 6*d.* to 2*s.* 6 per lb.

There are many districts in the wetter parts of Coor Wynaad and Travancore, where nutmegs would flourish perfection, and pay far better than either the coffee or te which is the reigning staple. The expense incurred planting up a few acres with nutmegs would be very sma It would even be possible to clear away, say half a doze of the standing coffee or tea trees round each pit intende for the nutmeg, and let the latter only take pride of pla and finally sole possession when it begins to crop. See in any quantity can be obtained from the Burliar Garde by applying to the Curator of the Ootacamund Botanic Gardens. It would be possible at first to sell all the pr duce in the country, and at very remunerative prices.

Black ants. The following useful notes a taken from the *Tropical Agricult rist* :—

How to Prevent Ants from Attacking Sugar.—Some of your lad readers will no doubt be glad of this hint, the utility of which I ca testify to, and which I discovered by mere accident. Put your suga (I mean the small quantities required for daily use) into bottles other narrow-mouthed vessels, and use a *common lime well squeeze in for a stopper* and ants will never trouble it.—*Demerara Gazette.*

To Prevent Ants from getting on Wash-Stands and Dressi Tables, &c.—Rub chalk round the legs of these a little up from th floor, till the wood is quite covered with it, and the ants cannot wal over the chalk. It must be renewed every week or so. Anothe plan to prevent ants getting on the table, teapoy, bed, &c., is to ti round the lower end of the leg or post a thin slip of flannel dippe in castor oil—they will not pass over this; or place the leg in pan of water. To secure boxes from their depredations, the best plan i to place them on glass bottles laid lengthways, and if kept free fro dust, the ants cannot ascend. They have a great dislike to indigo and will seldom touch cloth dyed in it or saturated in a solution corrosive sublimate; the proportion of one pound to four gallons water is sufficient. They also dislike salt, which may be mixed u with the mud or gober that is sometimes spread over the floor wall; though this is not an effectual remedy, it is as well occasionall to adopt it.

To Destroy Red or Black Ants.—After having discovered th aperture of their nests, surround it with soft clay formed into th shape of a funnel, and pour in boiling water. Where they are in th habit of infesting a floor or room, lay down thin slices of raw mea or liver, upon which the ants will soon congregate; let a person g about with hot water in a basin, and throw in the meat as it covered; then shake it dry, and put it down again to collect more.

A Recipe for the Destruction of Insects, which, says the *Builde* if it be one-half as efficacious as it is stated to be, will prove invalu able, and especially we may add in tropical countries, is publishe by the *Journal of Chemistry.* Hot alum water is the suggestion a an Insecticide. It will destroy red and black ants, cockroaches spiders, chintz bugs, and all the crawling pests which infest ou houses. "Take 2 lb. of alum and dissolve it in three or four quart of boiling water, let it stand on the fire till the alum disappears, apply it with a brush, while nearly boiling hot, to every joint and crevic in your closets, bedsteads, pantry shelves, and the like. Brush th crevices in the floor of the skirting or mop boards, if you suspec that they harbour vermin. If, in whitewashing a ceiling, plenty o alum is added to the lime, it will also serve to keep insects at a dis tance. Cockroaches will flee the paint which has been washed i cool alum water."

To Destroy Insects in Flower-pots, Grub, &c.—A plant-growe of considerable experience tells us that a strong solution of coppera in soapsuds water is very invigorating to ornamental shrubs and pea trees. It will also destroy the small grubs that infest the roots o pot-plants. Ammonia water, of the strength of one teaspoonful o

spirits of ammonia to two quarts of water, is also a good remedy for the white grubs in pot plants, while it is very invigorating to the growth of the plants.

A teak pest.

Mr. T. F. Bourdillon writes in the *Indian Forester* :—The teak plantations of Southern India, at Nelambur, in Cochin and in Travancore, are liable to the attacks of one or more species of caterpillars which from time to time swarm over the trees in immense numbers, and consume their leaves, thereby doing a very great deal of harm. With a view to ascertain the species of moth or butterfly whose caterpillar was so destructive, and to learn something of the life-history of the insect, one of our Rangers, Mr. V. K. Govinda Menon, who was trained at the Poona College of Science in the Forest branch, was deputed last year to study the subject. His report, which has just been submitted, in spite of a certain quaintness of language, is instructive and interesting. I have obtained the following additional information from the Ranger and others. He writes :—The attacks generally begin in April, when the teak tree has put on its new foliage, and they last for about six weeks, when the caterpillars begin to disappear ; but one or two may always be found on the teak if a search be made for them. The wet weather probably prevents the moth from increasing, and very little is seen of it until September or October, when, if the N.E. Monsoon is light, its caterpillar may again attack the teak, the attack lasting about a month. Both very wet and very dry weather seem detrimental to the spread of the insect. When the caterpillar begins to pupate, it suspends itself by threads at either end to a leaf, not necessarily a dead leaf, spins a cocoon round itself, and folds the leaf over so that it is quite snug. The caterpillar will eat the leaves of some jungle plants as well as teak, and it has been found in the jungle. I am thankful to say that the caterpillar has an enemy in the shape of a fly which apparently lays its eggs in it, in which case the caterpillar remains inert, and after a time, some 20 or 30 minutes, flies appear. The Ranger thinks that more than one species of caterpillar attack the teak, and he will be deputed to study the subject further when the caterpillars begin to appear. Certainly, the species that is the most common and has done the most damage hitherto is the black-headed grey caterpillar here described. I forgot to say that the caterpillar, when it has once begun feeding, never leaves the tree, though it may shift from branch to branch when its food is exhausted in one place. It does not drop by a thread to the ground when it wishes to change its skin, and therefore the system of tarring the stem of the trees, employed in Germany to prevent the caterpillars re-ascending them, is inapplicable.

How bug appears.

We were recently asked how bug can come to an estate previously free from it. Nietner thus describes the method : "The eggs, which are a mere dust, are carried about by birds or insects to which they adhere, or by the wind. [Hence the importance of dense hedges or windbelts of bug-proof plants, dividing the estate into fields.—Ed., *P.O.*] If these are deposited in a favourable place they will hatch, and we have then the bug in the larva state. The larva in course of time assume a more perfect form, the pupa state, and eventually change into the imago or perfect insect. In the larva state the male and female brown bug [miscalled the black bug from its attendant black fungus.—Ed., *P.O.*] are not distinguishable ; but in the pupa state the male is very distinct, having all the characteristics of the perfect insect. In the white bug the sexes are distinct in all stages. The perfect males either do not feed at all, or if they do, it is probably on honeydew, for having no sucker they cannot feed like the females. The number of eggs produced by a female brown bug is about 700." The brown bug is dreadfully infested with parasites, and, if enclosed in a bottle, the little wasps may be seen to emerge and fly about in a short time. The black fungus, which gives bugged trees their peculiar sooty appearance, is a fungus growing on the excretion of the bugs. This excretion or honeydew is much relished by ants of all sorts, flies, bees, etc. Mana or lemon grass spread on the ground or tied round the stem is said to be very useful by its smell. Tar is often used for the same purpose. Nietner holds that the black fungus does a lot of harm by filling up the stomata of the leaves, etc., and by penetrating their living tissues. A later authority, Mr. E. Green, Honorary Entomologist to the Government of Ceylon, does not think, however, that injurious effects can be attributed to the fungus. When pulled or wiped off it leaves the surface perfectly clean and glossy, disclosing no injury from the fungus itself. Moreover as most of the stomata are on the lower side of the leaf, and as the fungus only appears on the upper surface, the plant can hardly be choked. The real damage is done by the insect itself in inserting its proboscis into the tissues of the leaf or tender stem and sucking its contained juices. The eggs of the bug, which are oval and of a pinkish colour, are not actually brought forth by the female, but when they are matured the parent insect dies, the whole interior forming one mass of eggs protected by the shell. It is, by the way, closely allied to the lac insect. Sometimes the shells are found filled with a white flaky substance, which contains numerous parasites which have killed the bug.

The members of the scale-bug family are either without means of locomotion or else slow to use their limbs where present. They are usually more or less permanently anchored to the plant by their long-sucking tubes. The females of all scale-bugs are invariably wingless, the males possessing two wings. The mouth parts are situate far back on the under-surface of the insect between, or even behind the insertion of the first pair of legs.

Butter direct from vegetables.

Butter without the aid of a cow is what Willard G. Day, an inventor, of Baltimore, Md., promises. Electricity is the chief agent Mr. Day proposes to employ in the production of butter directly from the vegetables which form the food of cattle whose milk is used in the churn. Mr. Day first discovered that the peculiar characteristic traits of different varieties of butter, cheese, etc., were owing to general causes. One was the kind of food on which the cow was fed ; the other was the kind of microbe nourished at and by the roots of the plant which furnished the food to the cow. Armed with these two secrets (says the *New York Herald*) Mr. Day began his work, which consisted in extracting and then assembling artificially the same products which are usually brought about by Nature. He succeeded in producing from the vegetable

kingdom oils which differed very slightly from those of the animal kingdom. Having got thus far, the next step was to change the vegetable oil by giving it the same chemical constitution as that possessed by the animal article desired —in other words, to make the animal butter oil out of corn, grass, and similar vegetable substances. The secret in this part of the process Mr. Day found to consist in the fact that animal and vegetable carbohydrates strongly resemble each other. The differences which are found in oils are nearly owing to the nitrogenous sheaths in which the globules of oil are contained. Thus to this sheath is due the tallowy smell of tallow, the mutton or smell of mutton, as well as all the rank odours of many vegetable oils. When oils are extracted by heat or the mechanical violence of pressure, the deleterious nitrogenous characteristics of the globule sheaths are imparted to the oil globules themselves, and no art can separate afterward. Here comes in the great discovery in the use of the electric light. Mr. Day found that when these oils and fats were subjected to the radiant energy of powerful electric light, the nitrogenous sheaths were shrivelled and their contents put in a condition to be milked out or extracted by a gentle pressure without being contaminated by the characteristics of the animal or plant itself. Another effect was also produced. Whatever microbe was associated with any particular oil or fat was killed by the actinic power of the light, thus leaving the article free from any of its native microbes and ready to be used as a culture medium for any desired microbe. Among the microbes destroyed by the light are those which cause putrefaction and decay, and so the articles acted on by the light are readily preserved as long as they are protected from new invasions of Nature's hosts of destroyers. As a result, the various kinds of butter, cheese, etc., made under the Day processes show most remarkable keeping powers, far surpassing those produced by the old-fashioned methods. For the same reason the new articles are not affected by any diseases such as tuberculosis and typhoid fever, which may be carried and transmitted in the milk of cows, as well as by contamination from barnyard association.

LETTERS TO THE EDITOR.

TEA PACKET MOULDS.

SIR,—Can you or any of your readers tell me the size of box on which to make 1 lb. packets to hold tea?

BOB.

TEA PESTS.

SIR,—Here in Kandy (Ceylon) I've found nearly all the tea pests known; among them a small black beetle, which is a new and nasty one. It attacks the tea at each joint just below where the leaf joins and drills holes all through the wood which rots and dies back: (1) The leaf falls off. (2) The branch dies back. (3) The tree dies out. It's not very widely spread so far. The only remedy I know is to prune sharp and burn prunings at once. The insect is very small. Of the older kinds of pests I've found (1) Borer; (2) Black bug; (3) Mealy bug; (4) Brown scale; (5) Flushworm; (6) Tea mites; (7) Accarus theivorens (?); (8) Helopeltis; (9) Red spider; (10) Caterpillars (?); (11) Cank In spite of this we get 800 lbs. per acre and might get more.

KANDY.

CATTLE TRESPASS.

SIR,—In your issue of the 18th I notice that cattle trespass still a source of annoyance to planters, and there is no leg redress except on the Nilgiris. Your correspondent sugges pounding cattle on his own estate, which is surely not leg He goes on to say that shooting cattle is "highly illegal a highhanded." It may be in other planting districts, but not some parts of Mysore territory. The manager of an estate cl to me, as well as the one of this estate, has permission (whi has been gazetted) to shoot all stray cattle in the esta Cattle about here are very wild, or, to use my writer's wo "barbarous," and not easily caught. When there are two a three berries on a cluster in this not too flourishing co district, it does not do to have them knocked off!

GOWDA.

KADUR DISTRICT,
22nd June, 1898.

JOTTINGS.

SIR,—There are one or two points in your late issues I shou like to notice. Irrigating tea is all right, but how many can it? Your correspondent, "Jottings from my Note Book," ne have no fear of wash if he forks properly. I could fork the si of a house without the least fear. I have seen a wonderful res from tea being fired by accident. You would not know the fie Your para. *re* Cattle Trespass will get the planter into serio trouble one of these days if he is not careful. His action altogether illegal, and anyone who did it to *my* cattle wou suffer, I can tell you!

Can you find out how the wind treated them *this* year on t Annamalais? It would be interesting to know. Fate of exchan seems hopeful again, looks like open mints, I say.

Agitate that something more be done with the Governme Gardens so that planters can get economic plants; at prese we can get little or nothing.

I have managed to get 11 kola plants to live out of that se you sent me, but the growth so far is very slow. It may better this year, but the market has apparently gone.

PYKARA.

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

THE following cutting from the *Madras Times* is interest in connection with Mr. H. O. Newport's recent t to Australia in quest of Lady-birds :—

Mr. E. E. Green, Entomologist to the Ceylon Government, h been promised a consignment of living "Lady-bird beetles" fr the Cape, where, says Mr. Green, they have several species likely be useful to Ceylon planters. They are to be sent in a Wardian ca and will, he hopes, arrive in good order. He thinks that much go might be done by the gradual introduction of beneficial insects in t matter, and says that the cost of carrying out the work would comparatively small.

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

JAMAICA GINGER.

One of the most readable papers which we have seen for long time is printed in the current issue of the American *ournal of Pharmacy*. It is entitled "In the Land of inger," and is written by Mr. F. B. Kilmer, who has resided n Jamaica for several years. It contains the most graphic ccount of ginger planting and harvesting which has been rinted for many years, and from it we draw the following articulars. Between 25,000 and 50,000 of the Jamaica opulation depend for their living upon the ginger-crop. he ginger is of two kinds—"blue" and "yellow"—but ne plants are botanically indistinguishable; the "yellow" the better root, being brittle and more pungent than the blue," which is tough and fibrous. These, again, are subivided into "plant" and "ratoon" ginger—the former is inger planted each season, and the latter is a return crop, ecured by leaving a part of the rhizome, in the ground at ne harvest-time. Ginger is planted in March and April. ieces of the rhizome, each with an "eye," are planted. ew planters have settled farms; they clear a piece of the orest, burn the weeds, and plough the soil a little, then do ne planting. When once in the ground the plant appears require little attention, except that it must be well watered, nd as there is an abundant rainfall in Jamaica, no labour this direction is required. Attempts are rarely made to rtilise the plant, manure being scarce in Jamaica, as there re no stables. The most that is done is to plough in the eeds and cover the ground with banana waste. As an xperiment, watering the beds with sea-water and sea-weeds as yielded good results; but the average planter is quite ndifferent to scientific cultivation, and this is bad for him, ecause the soil is impoverished by a few ginger-crops and dried-up streams, general barrenness—in fact, a wilderess—marks the progress of ginger-culture." The deepack soil of the virgin forest is where the best quality is roduced, and to grow ginger under this condition involves ne destruction of large areas of woodlands by fire. This rning is considered of great importance, as potash and her mineral matters contained in the ashes are deposited sweeten the ground, while the fire also destroys insect sts. In consequence of the many thousands of acres of nd destroyed and abandoned in this manner in Jamaica, e local Agricultural Society has been at work since 1895 worn-out land, and with the aid of suitable artificial anures have had very encouraging results in reclaiming e land. The Society is extending their operations by curing larger plots and giving aid to planters by furnishg manures, &c. The "ginger season," or harvest, is from arch to January. When the stalk withers and the bloom s departed, the rhizomes are twisted out of the ground ith a fork, an operation which takes long practice to come expert in. After the soil and fibrous roots have en removed, the root-stalk is thrown into water, when it ready for the peeling-operation. "Peeling-matches," in nich the planter gets all his friends to join, are a time of uch merry-making in the sable community. The peeling mostly done by experts with the aid of a simple knife. far peeling-machinery has been a complete failure. The eration is an all-important one, as may be seen from amination of a transverse section of ginger. First there an outer striated skin, under which are numerous layers thin-walled cork cells. The oil contained in these cells in fresh specimens is very pungent, exceedingly aromatic, and almost colourless. As this corky layer contains the greatest amount of oil and resin cells, the deeper the peeling is made so much more of these substances are carried away with the epidermis. When peeled, the roots are thrown into water and washed; the purer the water the whiter is the product. Sometimes limejuice is used in the wash-water, which gives a whiter root, but as the lime-juice contains saccharine matter and pectose, it prevents drying, and mildew follows. After washing, the rhizomes are dried in the sun, and in from six to eight days they become thoroughly dry. At sunrise the ginger is put out upon a barbecue (platform of stone or concrete), turned over at mid-day, and taken in at sunset. The average loss of weight by drying is nearly 70 per cent. Experiments have been made with calcium chloride as a drying-agent, but the result was not equal to the native method, and the same may also be said of American fruit-evaporators, in which wood is used as the source of heat. It has been asserted that it is a common practice to bleach ginger with the fumes of chlorine or sulphurous acid, but Mr. Kilmer states that no instance of it is known in Jamaica, as the planters are unintelligent, and are opposed through prejudice to innovations. Mr. Kilmer tried chlorine gas as a bleaching-agent, but the product was of a dirty yellow colour. When the crop is fully dried it is carried, mostly by women, to the place of sale, which may be from five to forty miles distant. Here it is sold by the "heap," not by measure or weight. A "heap" of ginger varies considerably, according to the law of supply and demand. If the "hands" are finally shaped and large, there are fewer in the heap; if small, dark, and snarly, the pile is made larger. Should the price of ginger in London or New York advance, it is because the heaps in Jamaica have been distinguished, and should the price go down the heaps have become larger. The exporters of ginger assort the produce into four or five grades, the highest being the large-sized hands of light and uniform colour, the lowest being the ratoon finger sorts, which are small, soft and lacking flavour. Some of the hands weigh as much as 8 oz. The amount of ginger exported from the island during the last ten years was as follows :—

	lbs.		lbs.
1887	1,121,827	1892	1,822,531
1888	1,141,877	1893	1,526,884
1889	1,002,653	1894	1,672,384
1890 (half year) ...	554,193	1895	1,736,460
1891	1,219,197	1896	1,960,609

Half of this goes to the United States. An average crop may be estimated at from 1,000 to 1,500 lbs. dried ginger per acre, and in some cases 2,000 lbs. As already mentioned, the Jamaica Agricultural Society is improving the methods of cultivation by fertilisation, and from information recently to hand it is predicted that the crop now about to be gathered will probably be a record one, partly due to an abundant rainfall. This will mean lower prices for the ginger-planter.—*The Chemist and Druggist.*

PERFUME-MAKING.

In answer to a correspondent enquiring as to the method of extracting scent from flowers, we give the following description of the two processes generally adopted :—

(1) The Cold Process.

Procure trays with glass bottoms, spread clarified fat a quarter of

an inch thick upon each side of the glass; gather the flowers early in the morning, and spread thin upon the fat. Close the glass-sided box. Every second day replace the old flowers by fresh ones, and renew them twelve or fifteen times. Then scrape the fat from the trays, break it up into very small pieces and digest it in spirits of wine 60 over-proof, say two lbs. of fat to 2½ lbs. of spirits. Stir every day for a month, keeping it covered. Then bottle and label it "Extract No. 1." Now add fresh alcohol to the fat (1 lb. is sufficient) and stir daily for a month. Pour it off then, and label the bottle "Extract No. 2." Do the same thing a third time, and so obtain "Extract No. 3." Now you had three bottles, all containing different strengths of extract, and all of value according to their strength. The fat is now melted in a *Bain Marie*, is poured off, and kept for next year.

(2) THE HOT PROCESS.

Take, say 2 lbs. of flowers, being careful that there are no stems; put them in a round tin. Melt 6 lbs. of clarified fat with only just sufficient heat to melt it. Pour it over the flowers, and leave them covered till next day. Now get a larger dish with hot water to melt the fat, on the same principle as the glue-pot. This is called by the French a *Bain Marie*. Now take another round tin containing 2 lbs. weight of the same kind of flowers. Place two strips of wood on top of this to hold a sieve. Then pour in the melted fat from the first pan, thus straining the leaves and allowing the fat to fall on the fresh lot of leaves in the second tin underneath. Cover up and again leave till next day. Clean the first tin for the morrow, so as to repeat the operation each day for fourteen days, when the fat will be fully charged and is ready to be digested in spirts of wine as described above. Only sufficient heat is required to cause the fat to melt and flow, as the extracts are very volatile at a high temperature, and a great loss may be occasioned by over-heating the fat.

If more rose leaves are gathered than can be used on the same day sprinkle them with salt, when they will hold their scent for a few days. This is called salting the leaves. For oils of the same plants coarse cotton cloths are imbued with the finest olive oil and laid upon a frame containing wire gauze in lieu of glass. On these the flowers are laid and suffered to remain until fresh flowers are procured. This operation is repeated several times, after which the cloths subjected to great pressure to remove the now perfumed oil.

How to make the Clarified Fat.—Take 7 lbs. each of beef, mut and pork fat; chop fine on a board, and wash in clean cold water, t put in a boiler with five gallons of fresh water; put on the fire; two oz. of alum and a handful of coarse salt and forty cloves; until all the fat is melted; then get another basin with five gallon fresh water, and skim the fat through a wire strainer into the wa now boil the second time (adding the same quantity of salt and al for one hour, and then let cool. On each occasion of its coolin dark-coloured sediment is found at the bottom. This must be c fully scraped away. When the fat is perfected white and p throughout, it is remelted and put away for use.

How to make a Cheap Still.—Construct a metallic tank of al 100 gallons capacity, the interior fitted with a holed false bott about 9 inches from the base. Set in brickwork (although thi not absolutely necessary) with a fire retort under it. A funnel ab a foot in diameter at its greatest extent, with a rim to enter an flange to support it, is fitted like a saucepan lid over a correspond hole in the head of the tank. A pipe 2 inches in diameter—a c tinuation of the funnel—continues like a spiral worm around interior woodwork of a barrel filled with cold water, the end proj ing near the base like a faucet. This completes the apparatus. five-gallon still can be constructed for about $25 (about £5).

How to operate the Still.—The space below the false bottom of still is occupied by water, in which a few pounds of salt or alum dissolved to increase the boiling point. The tank is now filled w the desired flowers and the funnel-shaped lid is held in place being screwed down and the joint packed with moist clay. A q fire is lighted under the still, causing vapour, which percola through the flowers lying over the false bottom releases the a and steam and oil go jointly up the funnel, and wind their through the condensing corkscrew pipe. A stream of cold w running into the tub condenses the steam and oil, which flows a glass jug placed at the lower end of the tube. The oil is seen f ing on the top, and is skimmed off with a spatula or flat ivory p knife, or can be sucked off with a pipette (glass pipe), a crystal having a bulb about three inches from one extremity. The dist

TO PLANTERS.

PLANTERS WHO REQUIRE

Estate Tools, **Bricks,**

THE INDIA TRADING CO., Ld.,

11/12, 2nd LINE BEACH, MADRA

W. Prices on application.

places one end in his mouth, and, lightly touching the filaments of essential oil with the other, draws them into the bulb.

If the same distilled water is employed several times over, it increases the output of oil. The temperature of the steam must not be too great, or the essential oil is likely to be injured. Time—about three hours. The false bottom containing the stewed leaves is hoisted out, and the mashed mass is useful as a fertiliser. This process applies only to the rose.

Pots of different scented flowers should not be grown too close, as each will become tainted with the other and the virgin aroma of each will become confused. Plots of roses, or jasmine, or tube-roses should be separated by others growing vegetables or other scentless plants. The beds should run north and south so as to get the greatest benefit from the sunshine, which is an important factor in the production of superior oil. As an adjunct to some regular form of cultivation, scent-making should always provide a nice sum of pocket-money. A few sheets of glass and some fat are practically the only necessaries. The work is light and pleasant. Saturated lard is worth from £1 5*s.* to £1 10*s.* per lb. in London or Paris, and the spirit or "extract" is worth 3*s.* 6*d.* per oz. or £3 10*s.* per pint. —*Queensland Agricultural Journal.*

MESSRS. WM. JAS. AND HY. THOMPSON'S ANNUAL INDIAN AND CEYLON TEA REVIEW.

MESSRS. THOMPSON, in their Review, dated June 8, say: The publication in London of statistics relating to the trade of the twelve months ending May 31 brings an opportunity of reviewing the main features of the season now concluded, of recording results of general or particular interest, and of surveying the position and prospects.

The season opened under favourable conditions and with a hopeful outlook. In the background stood the record of many prosperous years; accumulated experience and knowledge, placing planters in position of great advantage; and the signs that our produce was making headway in all the chief markets. In the foreground stood the hopes raised by the remarkable increase in the use of tea at home during recent years; by the abundant capital attached to the Home Trade; and by the evidence that in none of the business centres of the world large stocks were in existence.

The outcome of the season, however, has not been fully equal to its early promise, and it is necessary to search for explanation of a result disappointing to many, though not entirely unexpected by those who a year ago took note of possible contingencies.

Turning, in the first place, to production. As regards India, owing to circumstances which may be considered exceptional, over large areas conditions prevailed which prevented planters from making tea sufficiently good to maintain its value. Taken as a whole, Assam kept up its high reputation—some estates yielding tea of exceptional quality—but results were not so uniformly good as usual, and gardens north of the Brahmapootra have generally suffered from adverse climatic influences. Cachar and Sylhet, on the other hand, temporarily lost ground in respect of quality and value of produce, largely attributable to the effect of the earthquake which was followed by widespread malarial sickness, rendering it difficult to maintain work at the highest point of efficiency—apart from the disturbance of factories, machinery, roads, and waterways. Estates in the Dooars appear to have been less affected; they have given full crops of average quality, if somewhat short of the excellent tea once produced in this district. In Darjeeling with a few exceptions results have been disappointing, notwithstanding the increased appreciation of its tea. Up to the date of the earthquake the gardens were doing well, but subsequently a general reverse was experienced, and although a fair yield was secured, the latter portion of the crop lacked the right flavour, greatly to the detriment of value. By some this was attributed to rapid flushing after excessive rainfall; by others to disturbance of soil during the earthquake, which affected the bushes. The crops from Southern India—slowly growing in volume—have not been of sufficiently good quality to hold their own in competition with other growths, but if managers will pay more attention to the details of cultivation and manufacture, there seems no reason why good tea should not be made there: if good, it will find a ready market here. The season was not a favourable one for estates in the Kangra Valley, but there is a demand for their tea abroad, and buyers will pay a fair price for such as have flavour.

As regards Ceylon:—Production increased, but at a slower rate than hitherto. Upon the whole the crop has maintained its ground in respect of quality, and although it has contained but few of the specially fine sorts originally made, tea of uniformly good make and flavour has been sent from estates situated on the higher levels, possessed of character so distinct from other produce as to make a market for itself. The position of properties which have not given "distinctive teas" and cannot work as cheaply as estates in the low countries seems less assured, and it will be well for their proprietors to make improvement of quality their first aim, in face of the tendency for values to decline for ordinary teas lacking special characteristics, wherever produced.

All growers in India and Ceylon have suffered from the high rate of exchange, which has raised the cost of production without bringing any compensation in the form of higher values in London. An inflated rupee may check further extensions, but the effect of this in retarding increase in production will not be felt for years. Some have also suffered heavy loss on rice, owing to the famine.

These several drawbacks to a successful season, however, would not have been so much felt if the market had not been checked and buyers discouraged by the signs that home consumption was not expanding as it used to do. Useful as our growing foreign trade is, it is still inadequate to do more than stiffen the price of particular kinds—the value of the crop, as a whole, remaining dependent—(1) upon the requirement of the United Kingdom; (2) upon its quality.

The Board of Trade returns show that in 1891 home consumption increased 8½ million lb.; in 1892, 4½ millions; in 1893, 1 million; in 1895, 6¼ millions; in 1895, 7½ millions; in 1896, 6 millions; and in 1897, only 3¾ millions; making a total of 37½ millions in seven years, *i.e.*, from 194 millions in 1890 to 231½ millions in 1897. By contrast with such progress, the increase of only 1¼ million lb. during the months ending March 31 was most discouraging; that the figures at the moment look better is due to recent heavy duty payments in advance.

When writing a year ago, we pointed out some of the causes contributory to the large expansion in the past, and remarked that as they had "been for some time in operation in London and other great centres, if not in the country, it would be unsafe to reckon upon home consumption expanding in the future as substantially as it has done for the past two years." We also showed that the margin for increased use of our own teas at home had become narrow, owing to the extent to which China tea had already been pushed out of consumption. The figures are as follow:—Of the total used in 1891-2, British-grown tea was 79 per cent.; 1893-4, British, 86½ per cent., China, &c., 13½ per cent.; 1895-6, British, 88½ per cent., China, &c., 11½ per cent.; 1896-7, British, 90 per cent., China, &c., 10 per cent.; 1897-8, British, 91½ per cent., China, &c., 8½ per cent.

Apart from these reasons, have any other causes operated to check expansion, and if so, are they permanent in their effect, or merely temporary?

The principal beverages competing with tea are coffee and cocoa. The quantity of coffee and chicory taken for home use in 1897 was 37 million lb. compared with 37½ million in 1896. The quantity of raw cocoa taken was 27¾ million lbs. in 1897 compared with 24½

TERMS MODERATE.

million lbs. in 1896, and the increase has continued since January 1, which means that several million pounds weight of cocoa and its compounds have been pushed into consumption, with the aid of lavish advertisement, mainly at the expense of tea. Opinions differ as to its future as a popular beverage. It lacks some of the properties which have made tea almost a necessary of life to the masses, and the price of the pure cocoas retailed is nearly double that of tea. An indirect reason for the comparatively short deliveries of tea last year may be the serious loss of income to the working classes incidental to the labour troubles. Renewed activity in the industries of the Midlands and North should beneficially affect a commodity of which wage-earners are the principal consumers.

Much attention has rightly been paid to fostering trade with other countries. The figures at foot show progress, but not sufficiently rapid to keep pace with the prospective increase in production. Our trade with America, indeed, continues small in view of the energy and capital devoted to the work of introducing our teas there, where we have to encounter the efforts of Japan to fill the opening left by the smaller receipts from China. We regard Russia as a more hopeful market, for the Russian buyers appreciate the best Indian and Ceylon teas and will pay a good price for them, whereas in other outside markets, whether Australian, American, or Central Asian, the demand is chiefly for the cheaper kinds and depends much upon the lowness of quotations. Business with Russia would be helped by the shipment of the fine sorts they like in larger lines, which prove to be most attractive.

The probability, then, seems to be that in the coming year the total supply may be somewhat heavier than the United Kingdom requires, and the surplus a little larger perhaps than the other markets will absorb. Under these circumstances it will be prudent to modify the policy, which has lately prevailed in some districts, of making the heaviest crop possible, irrespective of quality. So long as there was a fair margin of profit this policy was successful; but with higher cost of production and reduced selling value it ceases to be so. Prices have fallen here for such kinds partly because London has become the destination of tea, from all parts, too common to find acceptance elsewhere; and partly from a reason to which we referred a year ago, viz., that the principal vendors who make tea a speciality have mainly built up and are maintaining their trade by selling better tea than the average individual retailer—not by pushing the sale of inferior tea at lower prices. The proof that this is the case exists in the fact that for many years the finest qualities have met with the strongest competition, and in the evidence that those who have bought them are among the most successful traders of the day.

The profitable nature of the distributor's business is a factor of importance, and an element of strength not to be overlooked, as it ensures a buying-power commensurate with the large dimensions of the trade. The confidence with which wealthy buyers handle crops, however, depends largely upon their quality—not merely upon the statistical position—and there can be little doubt that the market has suffered more from the inferiority of the last Indian crop than from larger importations.

It is customary to assume that China tea has been ousted from British and Colonial markets, and need not be deemed a serious rival. Indian and Ceylon teas, however, have made their way—(1) by their superior character and value, accentuated by the deterioration in the quality of China Congou; (2) by the help of their low cost of production. It must not be taken for granted that the Chinese are incapable of reforming their methods and making good tea once more, in order to save a valuable trade now in danger of being lost; and it must not be forgotten that dear rupees with cheap silver place British growers at a serious disadvantage compared with those in the far East. There seems no occasion to fear competition at home from the produce of Java or Japan, but the Japanese will compete strongly with us to keep their trade with the United States and Canada, approaching an annual value of nearly £1,000,000.

Surveying the position as a whole, therefore, we conclude that the wisest policy for growers both in India and Ceylon will be to pay the closest attention to improvement of quality; to check the tendency to pack and send forward to any part of the world tea so common as to lower the reputation of their produce; and to be slow in extending plantations upon soil which has not proved its capacity of yielding good tea. The industry is so thoroughly established and sound that, with ordinary prudence and normal climatic conditions, successful results may be reasonably anticipated for well-manage properties not overweighted with unduly high capital.—*The H. an C. Mail.*

ORANGE-GROWING IN JAFFA.

By REINHOLD PALMER, JERUSALEM.

THAT much-prized fruit, the Jaffa orange, is now so well-know and appreciated in England that it may interest readers of this journa to learn some details of the method of its cultivation.

The name by which this variety of orange is known in England derived from the place where it is cultivated, the growing an prosperous little town of Jaffa on the coast of Syria, so well-known t those who have visited Jerusalem, for which it is the port. In th vernacular the name for orange is "Portugan," doubtless a corruptio of the word Portugal, and is an indication that the orange wa probably in the first instance introduced into Palestine from Portuga but as it is not recorded when or by whom this tree was thus intro duced, the origin of the name can only be a matter of surmis Although not a native of Syria, it thrives on the sandy coast of tha country better probably than anywhere else in the world, the climat conditions—the rainless summer accompanied by heavy night-dew and the winter without frost—being well suited to the growth an development of the fruit. But the culture must of course b supported throughout the long summer by artificial irrigatio Were it not that water to any amount can be procured in ever garden and at a moderate depth, it would be impossible to gro oranges in Jaffa. The whole neighbourhood seems to cover a rive of vast breadth, percolating through the sand *en route* to the se Hundreds of Persian wheels working night and day produce n sensible diminution in the supply of life-giving water.

Several varieties of the orange, such as the round Beladi, the Bloo Orange, the Mandarin, &c., thrive along the coast of Syria, but th oval and almost pipless kind known as the Jaffa orange is only pr duced in Jaffa itself and its vicinity; and this peculiarity, accordin to the native gardeners, must be attributed to the quality of th brackish water used in its irrigation. Until about thirty years ago th oval form was quite unknown, when a native gardener, quite b chance, through careful attention to his trees, succeeded, much t his own astonishment no doubt, in improving his Beladi or Spanis variety of orange into the Shamuti, by which name the Jaffa kind known in the vernacular. By selling grafts from his improve variety to other garden proprietors, he was instrumental in subst tuting the Shamuti for the Beladi orange throughout Jaffa. It is remarkable fact that all attempts hitherto made at growing the ov orange elsewhere than at Jaffa have not been successful; even Sidon and Tripoli on the Syrian coast, where the climate and so seem precisely of the same nature as at Jaffa, all experiments in th direction have failed.

The method of laying out a garden in Jaffa is as follows. The lan having been carefully selected and purchased—preference bein always given to a red sandy soil—the owner will get in his workme and start them on levelling and working up the ground. This is ver thoroughly done; the levelling of the earth being important with view to the future irrigating of the orange trees. The ground is the first instance well ploughed, and then with the object of effect ally removing every particle of weed, the workmen use their hoes turn up the soil to a depth of fully three feet. This expensive proce is very necessary, as the presence of even the smallest root of a wee will prove injurious to the trees and be difficult to remove later o While this work is going on, the proprietor will have fixed upon th spot where the well is to be sunk, and have commenced operation The depth at which water is found varies materially in differe gardens, and ranges from about twelve to sixty feet below the surfac consequently the cost of sinking his well is always more or less matter of speculation to the proprietor. The deeper wells are, ho ever, the exception and not the rule. The system of irrigating is b Persian wheels, simple in construction, cheap, quickly made an repaired; and experience has shown that they are much better adapte for the purpose intended than the steam pump. The whole of th simple machinery is quickly specified and described. A wide co wheel is kept going horizontally by a mule with a sweep; this tur

larger one perpendicularly, which is directly above the mouth of ne well. Over this revolve two thick ropes, and upon these are astened small wooden buckets; one side descends while the other ises carrying the buckets with them, these descending empty, those scending full; and as they pass over the top they discharge the water nto a trough which conveys it into an adjoining tank. The uantity of water discharged within the twenty-four hours depends n the speed at which the mule is kept going, and also, of course, on he depth of the well. An average-sized garden requires the constant abour of three to four mules to provide the necessary amount of ater, the animals being relieved about every three hours.

The ground prepared and manured, the Persian wheel fixed, and ccommodation—of the simplest kind of course—being provided for he gardener and the mules, the proprietor now proceeds to buy oung lemon trees about a year old. These are meant to be used as tocks upon which the orange slips are later on grated; and of hem there is always a fair supply available in the nurseries of the lder gardens. These lemon trees are now planted, under the upervision of the head-gardener, at a distance of four yards apart, nd the most suitable time for this operation is during the months f March and April, before the great heat has set in. A hedge of actus or prickly-pear is planted at the same time round the garden, which in a few years' time grows into an impenetrable mass, reventing the intrusion of man or beast.

The young lemon trees will now thrive without much further ttention, except that they must be carefully irrigated; this is done y a system of small masonry troughs running in all directions hrough the garden, and fed from the tank adjoining the well. The garden is generally divided into four equal parts, each part being rrigated within the course of two days, so that every tree receives ts share of water every eighth day in rotation; and this is considered mple. A small trench is dug round each tree sufficiently large to old its requirement of water, and as the tree grows and needs a arger supply, the trench is enlarged; the amount of water that will ventually be required must therefore be calculated on the basis of he irrigation necessary when the trees are six years old, and may e said to have reached maturity. If the garden is a full-sized one nd contains about six thousand trees, it will be necessary to sink ither two wells or one well sufficiently wide to admit a double set f buckets, thus raising double the quantity of a single set in the ame space of time.

During the winter months the garden is left to itself, the gardener mploying his time in taking the mules to graze, thus saving the ost of feed. The winter (or rather rains) over the garden is weeded, manure is worked into the soil, and the trenches round the trees are remade and enlarged. Irrigating commences about the end of June, nd lasts till the end of October or middle of November.

In order to recoup himself for his outlay while the trees are grow- ing, the proprietor will sometimes arrange with his gardener to grow vegetables in the empty spaces between the young trees, giving him he seed and one-third to one-half the produce of the vegetables in lieu of wages. This system is, however, not considered economical n the long run, as the trees, which are purposely grown in close proximity to each other, really require the whole of the soil; and their development and productiveness is retarded by the growing of vegetables.

The young lemon trees are allowed to grow for two summers before the orange slip is grafted upon them; this operation is performed in the autumn by the head-gardener, who is an adept at this work. After the fourth summer, calculating from the time the lemon stock was planted, a few oranges may appear on the trees; and during the following two years the whole of the expenses of a garden will, as a general rule, be covered by the sale of the orange crops.

It is generally assumed that after the fourth year a garden becomes self-supporting; but it will require two years longer before a return in capital outlay can be expected. After the sixth year, however, a garden that has been well attended to will not only pay all expenses, but give a handsome return as well. The fortunate proprietor will now also have the further satisfaction of knowing that the market- able value of his property represents probably more than double the whole of his outlay. This will give an idea how profitable orange-growing in Jaffa really is to those who can afford to wait a few years for a return on capital. To the native of Jaffa only one form of investment has a charm—the height of his ambition is to own a "Biarah," the technical term for an orange-garden; unfortu- nately for him, however, he as frequently as not launches upon the enterprise without having sufficient capital to see it through success- fully, with the result that he is compelled to borrow money at a ruinous rate of interest in order to meet his current expenses, and finally has to part with his property before he has seen any of its fruit. This explains why most of the garden property is in the hands of the money-lending class, who have had very little trouble in growing the trees.

Once the garden is in full bearing, the proprietor, apart from an occasional visit of supervision, has little to do beyond selling his crop of oranges, paying the expenses, and pocketing the balance.

The gardener in charge receives a fixed wage of from two to two pounds ten shillings per measure only as long as the trees do not bear; once they are in full bearing he is no longer paid by a fixed wage, but receives a share of the produce, generally one-twelfth to one-tenth of the crop. It is also understood that the gardener's wife and family, who live on the premises, assist in the garden-work without extra remuneration; hence the size of his gardener's family is a matter of some consideration with the owner. This system of making the gardener a partner in the produce of the garden works very well, as he thereby acquires an interest in the general upkeep of the property.

It is difficult to calculate the exact cost of laying down a garden. The price of the land varies of course according to position and quality; then the depth of the water below the surface and conse- quent cost of sinking the well cannot be estimated to a nicety. As a general rule, however, a garden containing six thousand young trees will cost from eleven hundred to twelve hundred pounds to lay down complete, with livestock. To this sum will have to be added five years' expenditure (during which period the garden is assumed to be unproductive) at the rate of one hundred and twenty pounds per annum, making six hundred pounds. We have, therefore, a total of eighteen hundred pounds, representing the capital outlay on the garden up to the time that the trees are in full bearing. From now onwards the crop of oranges will have an annual value of from four hundred to five hundred pounds; and this will leave the proprietor, after deducting all expenses for wages, feed of live-stock, taxes, repairs, &c., a clear revenue of ten to fifteen per cent. on his total capital outlay of eighteen hundred pounds.

The risks which the Jaffa orange-grower runs, as compared with those which the grower in Florida has to face, are infinitesimal. The storms that visit the Syrian coast, although of frequent occur- rence during the winter months, are not of such force as to damage the trees; in fact, it is remarkable how very small is the proportion of ripe fruit even which falls to the ground after a storm. This is no doubt due to the fact that the Jaffa orange tree is not allowed to grow larger than a good-sized shrub; and as the trees are placed only four yards apart, they afford each other very considerable protection from the force of the wind. The cactus shrubs also, forming the hedge of the garden, grow very thick and high, and give additional protection from the storms. Blizzards and frosts, which have proved so ruinous in Florida, are quite unknown in Jaffa.

Owing to the good keeping qualities of Jaffa oranges, which enables them to be shipped to distant parts, there is always a brisk demand for them, and the grower has hitherto had very little difficulty in disposing of his crops at good prices. If not exorbitant in his demands, he can almost invariably sell his fruit for a lump sum while the fruit is still green, and before the winter, with its risks of hail, &c., has set in. The shipper who purchases the fruit in this way takes over the whole of the risk of any damage that may happen to it, and he cuts the oranges from the trees whenever it suits him to do so; the contract only stipulating that the garden is to be cleared by the middle of March, as the proprietor likes to see his trees free of fruit before the new blossoms appear.

The whole of the crop of Jaffa oranges does not at the present time exceed three hundred thousand boxes of about one hundred and sixty oranges each, which is a mere trifle compared with Spanish or American crops, and about four-fifths of this quantity is at present shipped to England.

The orange-growing industry is almost entirely in the hands of natives; a few of the newer gardens are, however, owned by Germans and Frenchmen.—*Chambers's Journal.*

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (June 10, 1898) says:—The enormous supplies in Public sale still continue, but the demand has not been so good and the market closes rather easier.

About 1,400 bags East India were offered and met poor competition, a fair proportion being bought in: one favourite Home Trade mark, however, realized full prices.

Central American kinds, which formed the bulk of the catalogues, met very little attention and the greater part was bought in, the remainder selling at 1 to 2 lower.

The Terme market has again been dull with only a small business passing, and quotations mark a decline of about 6d. since our last.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending June 8th, 1898, says:—Bank rate 3°/₀. Bombay Exchange closes at 1s. 3 1/16d. Brazil Exchange 7⅝d. Rupee paper 3½°/₀ 62⅜. Silver 27¼d. per oz.

Public sales which were suspended on the 24th May for the Whitsuntide holidays were resumed on the 2nd inst. Supplies continue heavy, and with a fair demand the bulk has been disposed of at about steady prices for all kinds, fine being well competed for. Brazil kinds are steadier, and the Rio Exchange shows a material advance.

Daily receipts averaged 6,800 bags in Rio and 5,400 bags in Santos.

Futures: Since our last prices have fluctuated, closing steady at about 3d. below the late highest, viz.:—Good average Santos in Havre, September delivery fcs. 37, in Hamburg pf. 31, and No. 7 low ordinary Rio in New York $5.85.

To-day's London official quotations are:—

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," 11/12, Second Line Beach, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 11 and 12, Second Line Beach, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 15th July, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Pollibetta, *7th July.—Weather.*—The "break" still holds sway. Looks as if the monsoon is going to give up the go by this year. We are getting a little rain every day. The heaviest was ·50 in. on 4th. *Crops.*—This weather has been very good for crop. The berries have increased very much in size and could now stand any big onslaught of wet. *Plant Diseases.*—Coffee looking very healthy just now. The effect of this weather may be to bring on an early attack of "leaf," but it is best over soon. May it might cause two attacks! Borer has been bad in parts of the Province, but not so much hereabouts. *Labour.*—Stationary. *Health.*—Good.

PLANTERS AND EXCHANGE.

I. Some Points for High Exchange.

It is not the intention of the present article to give a comprehensive statement of the many arguments that have been brought forward in favour of the maintenance of Exchange at a level of 1*s.* 4*d.* per rupee, or higher. There are far too many points of this kind to be dealt with in a brief article. Hence, the present intention is rather to mention one or two of the leading arguments, and then to dwell more especially on such as have been put forward *with special reference to the interests of the planters in India.* This appears to be the proper line for a paper such as this. It has not so much to do with the question of how Government is to raise revenue, as with that of how the planter is to

achieve prosperity. The main argument in favour of a rise in Exchange is that it would lessen the amount payable by the Government of India for Home Charges, and would thus lighten taxation. Another argument is that low exchange hampers the Import trade of the country. The latter point has been stated but diffidently of late years, however, not so much because it opens the question whether India need seek to have imports at all instead of making the best of her own products, but because it disarms opposition to the counter argument: if high exchange is favourable to Imports, low exchange must be favourable to Exports. This would be a dangerous admission for the high-level advocate, seeing that the Export trade of India is considerably more important than its Import trade. We may leave points of revenue and taxation to the press in general. As regards the arguments that more nearly affect our readers, we may appropriately quote words uttered by the Hon'ble Mr. (now Sir) James Mackay at a public meeting held at Calcutta in 1892 in connection with the Indian Currency Association.

Mr. Mackay observed with regard to tea prices that taking the level of Calcutta prices as 100 in 1873, in 1880 it was only 82, in 1885 only 55, and in 1892 only 41. He then added: "Some tea people will tell you that the fall in the price of tea is due to over-production, not to low Exchange. But can they point to any glut of markets in support of this theory? Or can they say that low exchange has done anything to keep up prices?" To many of our readers questions such as these will appear trivial. Planters will say in many cases, "We want no *theory* in matters of this kind, we have had practical proof that in times of low Exchange we are prosperous, and in times of high exchange we are not." Men like Sir James Mackay cannot, however, be dealt with in this offhand manner. They make statements, and call them arguments; they expect arguments in reply, and dub these mere statements whenever possible. Now, the speaker whose words we have already quoted said on the same memorable occasion: "Some people interested in tea tell you, when they sell their tea at home if exchange is low, they are able to buy more rupees with the proceeds, and that the rupees so far satisfy their tea garden coolies and their managers and assistants just as well at 1*s.* 3*d.* as at 1*s.* 6*d.*, and that, therefore, they rather favour a low rupee. They admit frankly enough that it may be a little hard on the cooly, and on the European staff, to give them the same number of coins when these coins have declined in value, and they also admit that the time will come if the rupee goes on depreciating, when the cost of labour and management will be bound to rise. But in the meantime they say it has not done so." Mr. Mackay proceeded to state that a mistake was made when it was thought that as good a sterling price was got for tea with exchange at 1*s.* 3*d.* as with exchange at 1*s.* 6*d.* "The course of prices proves," he said, "that such is not the case." Not satisfied with th Mr. Mackay next remarked: "But even if the sterling pr did not decline, and exchange went down to a shilling, a coolies' wages did not rise and the European staff could got to work for the same rupee salaries, what about t value of tea property? Suppose a man brings out £10,000 1*s.* 6*d.* and puts it into a tea garden, the tea garden costs h a lakh and thirty thousand rupees. He goes merrily helping the rupee in its downward course, because "i good for tea," and the rupee goes down to a shilling. and bye the time comes when he has had enough of In and he wants to gather his assets under his own eye England, and he sells his garden. Now suppose he gets own money back again, a lakh and thirty thousand rupe when he comes to transfer that money to England, inste of his old original £10,000, he finds he is the happy possess of only £6,500."

We quote these remarks at some length because they g a high-level view of the matter with special reference to t planting industry. Arguments of a similar kind are lik to be brought forward in London before the Curren Committee of 1898. They are arguments that must be m if low-level advocates are to win the day. These gentlem must be prepared to answer statements such as the abov they must clearly show how largely such statements a founded upon and surrounded by presumptions and suppo tions. When informed that falling Exchange merely acts a *temporary* stimulant to the price of tea or coffee, th must be prepared with a reply. In our next paper propose to suggest some points that would be natura embraced in such a reply. The exchange question can be settled from the narrow point of view of a particu community or industry; but if each such community industry would deal with the problem as it affects its o interests and not wander into the wide arena of gene discussion, the settlement of the question should be grea facilitated.

WHERE TO PLANT RUBBER.

IT is in starting a new industry like that of rubber-growi that the practical planter of say coffee, tea, or indigo, fe himself hopelessly at sea. It is at a juncture like t especially that he finds himself so seriously handicapp by his ignorance in botany. What soil shall he choo what aspect, what elevation? It is often of only part use to refer to the countries of which the plants in are qu tion. In nine cases out of ten the information supplied fragmentary and incomplete, if not actually unreliable. prove this we have but to instance the well-known care tea. Yet in the absence of a knowledge of botany, t planter desirous of experimenting has no other sources information open to him.

Let us glance at the method in which a man with ev a slight acquaintance of that fascinating science would to work. The plant in question belongs to a given natu order. Of that order there are doubtless some specime at least represented in his district. He seeks to disco specimens of the indigenous flora most nearly allied to

particular species with which he desires to experiment. He will find out the localities where they thrive best, examine the soil and situation, and finally will have become possessed of a sometimes very accurate knowledge of the requirements of his new product. Where indigenous plants of a given order thrive well, it is safe to suppose that nearly allied exotic specimens of the same order will also thrive.

Suppose we apply, as far as our imperfect knowledge will allow, this method of working to the choice of land for rubber plantations. The first thing to do is of course to decide upon the particular kind of rubber you wish to try. For there are many plants that yield rubber, but are, botanically, widely separated from each other. However, we shall suppose that the new favourite Para, *Hevea braziliensis*, is the one to be taken up. Now Para belongs to the natural order of Euphorbiaceæ, of which one of the commonest and well-known representatives is the well-known "Nelli kai" tree, *Phylanthus emblica* and perhaps still better known castor oil plant, *Ricinus communis*. That valuable but little-known plant, *Croton tiglium*, is also of the same order. To it also belongs another variety of rubber, the unprofitable Ceara, *Manihot glaziovii*. It is not difficult even for the unskilled observer to recognize plants belonging to this order. A very general distinguishing point, and one easy to grasp, is that the leaves of nearly all Euphorbiaceæ possess glands at the base of the leaf, just where it joins the stem. It is true the glands are not the most conspicuous feature of the leaf, and in fact require some little search, in certain cases, to discover. More trustworthy as a guide is it to remember that the stile or pistils, *i.e.*, the female organs of the flower, remain on the fruit till the last. Of pistils, most species of this order have three, though some have two, or only one.

Now here we must stop for a moment, for knowledge is halting. The reader must now take up the work himself, aided by the services of the nearest available botanist. For an order possesses species wide indeed from each other in their habits and requirements. For instance the two rubber trees belonging to this order, Hevea and Ceara, seem to thrive in very different localities. The former wants moist, rich soil with a high temperature, the latter does best in dry stony soil at any altitude up to 5,000 feet. On the plains, indeed, it threatens to outstrip even the *babool* in clothing barren lands no other tree can live on.

Another important species of rubber, *Castilloa elastice*, belongs to a separate order altogether, the *urticaceæ*, which comprises the whole family of figs, of which India possesses so many species. A very well-known representative of this order is found in the charcoal tree, *Trema orientalis*. Most *urticaceæ* have rough leaves, similar to those of the rhea or nettles. Their flowers are either borne in bunches or are catkin shaped. Of the former kind of flowering, *i.e.*, in bunches, the charcoal tree is a good example. Hemp, the mulberry-tree, figs of all sorts, the jack, and the bread-fruit tree are also comprised in this group, so that no fear need be felt as to lack of material on which to work. Rather will it be found that the very wealth of specimens will increase the difficulty of the work.

NOTES.

Potatoes free from disease. A correspondent of the *American Agriculturist* writes :—For the past three years I have used sulphur when planting potatoes, rolling the sets immediately after being cut in dry sulphur-powder, which adheres to the tubers, which are planted the same day. Since following that method I have had no scabby potatoes.

Apple-growing. Elsewhere we insert an interesting article on apple-growing in New Zealand. In these days it is not impossible that the impoverished planter will find that a few extras in the shape of fruit or other products will do a lot to keep the pot boiling. If no spare land is available, interplanting among the staple itself is always practicable. And as to the crop of fruit, remunerative prices would always be obtained from contractors.

Tea to the fighting Yankees. It was only to be expected that Mr. Chamberlain would put his foot down on the proposal of the Ceylon Association to send the American army a free gift of tea to keep up their spirits during the war. It would have been a grand advertisement, and it is a pity it cannot be carried through *sub rosâ*. There are more ways than one of doing the thing, though we fancy nothing will be attempted. The Minister for the Colonies has such a very great deal to say, you see, on all Ceylon affairs.

Darjeeling tea plucking. It will not be a little disturbing to high elevation tea planters to learn how very fine Darjeeling planters now have to pluck to keep up their prices now-a-days, writes a Darjeeling correspondent to the *Planter* :—

> Everyone is crying out for finer quality teas, but where is it to end? We came down some years ago in the plucking, from four leaves to three, and then again lately from three leaves to two, which system is very vigorously enforced now. It is said we must pluck still finer, and I suppose it must be one leaf and a bud which will only give half quantity, but then again after this the—?

Male coffee trees. It is a common idea amongst planters that in every nursery one is sure to find a certain proportion of so-called male trees. These are distinguished by their long and narrow leaves. It is held that such plants never bear, and should consequently be destroyed in the nursery. Botanists who have heard of this idea are very curious to obtain blossoms from this tree for examination. But somehow or other, fairly common as this "male coffee" is said to be, specimens have never been obtainable. We should be much obliged if one of our readers would kindly forward us a flowering branch, as we wish to submit it to a botanical expert for examination and report.

Saltpetre. It has always struck us as very curious that South Indian planters, with their fondness for expensive English chemical manures, should not have used the crude Indian saltpetre more than they have. Now, in talking of saltpetre, we do not refer to what commonly goes under that name in South India. *That* is nothing more than muriate or sulphate of potash, and

contains not an atom of nitrogen. The true saltpetre is *nitrate* of potash and contains a large percentage of nitrogen. It is very cheap, about 80 rupees or so per ton, compared with the expensive nitrate of soda. A suitable combination of saltpetre, wood ashes and fine bone meal would make a perfect and cheap manure.

"The Planter." We are glad to see our Calcutta contemporary in a new suit of clothes, cut so as to allow a little more freedom of movement. The *Planter* has entered its sixth year now, and trousers have succeeded the knickerbocker and petticoat stages. We wish it steady and healthy growth, and in doing so indorse its remark that "further increased success must depend largely upon the interest which planters themselves take in the paper—upon the extent to which those concerned assist us with their arguments and information, and so create that interchange of thought and knowledge from which all real advancement springs." The same words might be employed just as appropriately with reference to *Planting Opinion*.

Fruit-preserving by dry-air. Several interesting experiments in fruit-preserving by means of the dry-air process have just been completed by Dr. Brown, bacteriologist to the Agricultural Department of New South Wales. Apples, grapes, pears, and plums put in dry-air jars over two months ago were found to be in first-rate condition when opened, retaining their firmness and flavour in an exceptional degree. The same class of fruit kept in a cool chamber, and packed on green pea-shells simultaneously with the other, was soft and tasteless, and another parcel, which was simply kept in a cool atmosphere without any special treatment, had absolutely decayed. The result of the dry-air experiment is regarded as most satisfactory. Further trials of the system on a more extensive scale will be made.

Fruit-growing in India. It is good to learn that the possibilities of the Indian fruit trade are attracting widespread and general attention in Europe. In an interesting article on the subject, *Indian Gardening* says it has received enquiries from places so far distant as St. Petersburg and Brussels. If our British or Indian capitalists are not very quick about it, remarks our contemporary, we shall probably find at no distant date a Russian, G man or Belgian fruit syndicate established in India. Bei first in the yield, they will have very soon the enti monopoly of the fruit trade.

By the way, we are surprised to find our usua well-informed contemporary reproducing such inaccura information on edible and poisonous mushrooms as contained in its issue of the 30th ultimo. The Editor shou know better than to endorse the erroneous ideas about called tests, such as telling by the smell, by the blackeni of silver, &c., &c.

A war tax on bananas. Some idea of the enormous tra in bananas (plantains) which h developed in tropical America m be gathered, writes *Indian Gardening*, from the fact th growers of other species of fruits are urging Congress levy a war tax of 25 cents per bunch on bananas, becau they regard bananas as a formidable competitor with oth fruits: so strong, indeed, that the growers of other fru urge that they cannot make a living wage out of them consequence of the banana competition. The bana growers, on the other hand, argue that any tax on th crops would press hardly on them, as cargo after cargo them arrives in an over-ripe condition, upon which thousan of dollars are continually lost. Now compare the fr industry in the United States with that in India. Wh we have been consistently urging is that a large fortu awaits any enterprising European who first puts his capi and energy into the development of the fruit trade of Ind

Investigation of Malaria. The Kurseong correspondent *The Planter* says that Surgeo Major Ross, of mosquito fame, h been up in the district making investigations on malar but was obliged to leave owing to the coolies taking hi for one of the dreaded inoculators. The same correspon ent is guilty of a slight "derangement of epitaphs," ho ever, when he alludes to the she-mosquito as "t *decimator*" "(*sic*)" of the fillaria of elephantisis "(*sic*) and the plasmodia of malaria, and consequently "one of t greatest enemies of mankind." He adds:—"It is report that many of the bad cases brought to Dr. Ross as mala were anchylostomaisis, scarcely recognised in this distri before, and we believe that it is much more prevalent th is imagined not only in the Terai but throughout the hil and that the European population is not entirely free fr it. The spreading of anchylostoma through the tea di tricts deserves to be very carefully watched, as not on has it proved capable of decimating whole villages Ceylon and Egypt, but of increasing the death-rate garden coolies to an appalling extent."

The Home Market. *Coffee.*—During May the world visible supply has decreased to t extent of 11,580 tons, writes the *P. M. Review* of 11th Jun but there has been in the same period an increase in bo the European and United States' stocks. This would see to point to larger arrivals at the different ports where t distribution for consumption takes place, and that t producing countries have been freely selling their rece crops. The heavy arrivals here have again been press forward at auction, but, as is often the case during Jun

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

there has been a decided falling off in the demand, and quotations have in consequence, in some cases, been rather in buyers' favour. Costa Rica and other Central American sorts have been the principal kinds offered, the few parcels of really good fetched full values, but common qualities were often from 1*s.* to 2*s.* cheaper. Hardly any East India has been offered; in fact, little more can now be expected, and merchants are in consequence asking full prices. The terminal market has been quiet, and values are about 6*d.* cheaper. The Dutch Trading Company have advertised their next sale for Tuesday, when 20,500 bags and 28 cases will be offered against 17,107 bags and 42 cases at the corresponding sale last year.

Indian Tea.—The supply has been moderate, and as the demand has shown improvement, prices for all grades are firm, while, in some cases, advances have been established. The Teas showing an advance are those worth from 9*d.* upwards, the quantity offering being comparatively small. There is not likely to be any important addition to the stock of these kinds for a month or two, and a very firm market is anticipated. The values of the lower quantities, and especially Tea for price, are also firm, and clean sweet Tea is not obtainable in any quantity under 5½*d.*, while the bulk of the supply consists of Tea above this price and up to 7*d.* to 8*d.* Of the few lots of new season's, the Assams were fairly good for first arrivals, but the Darjeelings were of but moderate quality, being deficient in flavour; however, they were well competed for and fetched prices, in most cases, much above valuations. Advices continue to report the outturn both from Cachar and Sylhet as being very deficient in consequence of the severe drought prevailing, and it is quite probable that the estimate of the crop for these districts will have to be materially modified. At the public sales 10,500 packages were brought forward, including 473 new season's and 1,970 withdrawn.

Ceylon Teas.—The first sale since Whitsuntide took place on Tuesday last, when only a comparatively small quantity was brought forward, and, notwithstanding the poor selection of desirable Teas on offer, firm prices ruled throughout. The common grades of Pekoe and Pekoe Souchong were again in demand, and the latter in many cases showed a slight advance on previous values. Medium Broken Pekoes were still in small supply, and difficult to obtain, while the better sorts were firm and in some cases rather dearer. The larger exports from Colombo are now beginning to arrive here, and the sales advertised for next week will be considerably in excess of those that have taken place for some time past. This should lead to more reasonable prices for the medium and lower grades, when a good business may be expected to be done in them. At the public sales 18,900 packages were brought forward, of which about 1,600 were withdrawn.

LETTERS TO THE EDITOR.

TO CORRESPONDENTS.

["VIA PALGHAT."—Sorry we can't quite see our way just now to engaging the staff you mention. "W.T.H.H."—Are you trying to be funny? If so, you might give your name and address. We have a vacancy here for you."—ED.]

DISEASED COFFEE SEEDLINGS.

SIR,—I am sending you, by this post, a few coffee seedlings and shall be obliged if you can tell me the cause of their state. I have large nurseries (baskets and beds) and continually find patches of 8 and 10 seedlings like those sent you. Thanking you in anticipation.

FOREST.

[We have submitted the specimens sent us to an expert, and shall publish the report in due course.—ED.]

SMALL-POX CURE.

SIR,—As small-pox often breaks out in this district, I send you a cutting from *Liverpool Mercury*, etc., etc.

The *Liverpool Mercury* of March 25, 1877, gave the following as a cure for small-pox:—"The worst case of small-pox can be cured in three days simply by the use of cream of tartar. One ounce dissolved in a pint of warm water, drunk at intervals when cold, is a certain never-failing remedy. It has cured thousands, never leaves a mark, never causes blindness, and avoids tedious lingering."

"D."

SEED WANTED.

SIR,—Can you let me know where I can get seeds of the sandal tree; also of logwood, which was mentioned in one of the issues of the *Planting Opinion* as a substantial hedge? I also require seeds of American cotton plant, which is a perennial. If you could kindly recommend to me any gentleman from whom I could procure all these I shall feel obliged.

MIRZA MEHDY KHAN.

SAIFABAD, HYDERABAD, DECCAN,
27th June, 1898.

[Apply Mr. J. Cameron, Curator, Mysore Botanical Gardens, Bangalore.—ED.]

A PERTURBED READER.

SIR,—I would like to know if anything more has been found out about Mr. L. W. Grey's "Improved Coffee Seed" that we read so much about in January, 1897.

We have heard no more for many months from the wily "Gas-tag," the learned "Normanton" and other four correspondents.

Are there no planters in India to write for a paper *for Planters?*

I am afraid it is like the Irish Naturalist who, in enumerating and describing the snakes in that country, began by saying "there are no snakes in Ireland," so there are no planters in India!

SIC GLORIA MUNDI, ETC.

KADUR DIST., }
26th June, 1898. }

TO TREAT A SIT-FAST.

SIR,—Can any of your readers instruct me in the treatment of a sit-fast on a pony's back? I shall be immensely obliged if some one will, as I've exhausted all the treatments I can think of. The "history of the case" is this. The pony was sold to me by a man who represented the sit-fast as a gall caused by a native saddle used in breaking in the pony to saddle, and which would be better in a week or so, with the application of a little Elliman's. It was then a swollen lump of about the size of a small hen's egg. The treatment he advised did not seem to do much good, and after about a month and a-half, it was lanced and let out a lot of matter and stuff. I then applied Condy's fluid to the wound and kept wet bandages of it on all day; this together reduced the lump to about a quarter of the size and took away much of the pain. When the wound healed up, there still remains a perceptible lump which is soft and seems to contain matter still, but which after poulticing for three days will not come to a head, and I am now rubbing in Elliman's more for the sake of doing something than with any hope that it will do any good, so I'm at the end of my tether and write in the hopes that you may number among your readers some one who will be good enough to give me the benefit of his knowledge and tell me what I ought to do. I've been told the best thing I *can* do is to get rid of it to some chap who is as big a fool as I was to buy it, but I don't want to do that just yet if I can help it, and then there might be difficulty in finding such!! It was under exceptional circumstances that I was "bad" so badly, into which there is no use entering here.

Viâ PALGHAT.

NOTES FROM CALCUTTA.

SIR,—I notice in a late issue of your paper that leaf disease [There is leaf disease and leaf disease. The American variety seems much like trees, but is named differently.—ED.] has got well into the Brazils, Costa Rica, the West Indies, &c.

[We omit your remarks here *re* Ceylon planters, as it would tend to keep alive the erroneous impression that we have a "down" on Ceylon planters.—ED.]

However "it is an ill wind," &c.; if coffee crops are reduced to one-fourth in these vast countries, it will be good for Southern India, as our American cousins will have to take their coffee, and though prices of coffee are good, they may run up much higher.

The rains have failed so seriously in Cachar and Sylhet that many tea gardens will seriously suffer, through the light rainfall, caused by the Nagahs and other Hill tribes being allowed to destroy thousands of acres of virgin forest yearly for *one* grain crop. With so wretchedly administered a district Forest Department to *conserve forests* is a farce. With t minished rainfall, it is contemplated to plant coffee in lieu tea as a 70-inch rainfall, four months cold weather down 50° at night, with heavy dews and rich soil-planting cof will be a move in the right direction already started in Assam

How funny it is for your correspondent in the issue of yo paper of the 18th instant to deem *his* method of protecting ste land from washing is *original*. I call it "gaulting," and did on the Shevaroys in 1876. And early in the eighties wr both to Ceylon and S. India planting papers commending it the planters. He is welcome to suppose it original. I, howev so far back as 1876, I learnt the method from the late Colo Scott and Capt. Godfrey in the sixties. I can strongly comme it to the writer in your journal.

CALCUTTA, EDGAR QUARME.
23rd June, 1898.

GENERAL ARTICLES.

APPLE-GROWING IN NEW ZEALAND.

WHILE the Tasmanian grows apples in fifty-acre blocks, a gets his neighbours to do the same, the New Zealand fru grower has generally planted out but a few acres, and those a large number of varieties, ripening at different times. Th fact accounts largely for the higher commercial standing Tasmania as an exporting colony. But New Zealanders a beginning to realise the disadvantages of their system. A rece offer of their Agricultural Department to send a shipment apples to England, and give the growers a guarantee of a pen per pound clear, disclosed the weakness of the situation ve clearly. Although the Canterbury growers succeeded in co pleting a shipment in March last, a similar effort in the Auc land province to raise 50,000 bushel cases had to be abandon owing, principally, to the impossibility of getting contributio in quantities worth handling.

New Zealand apples are probably the best in the world, b the men who grow them are mostly small settlers, who ha neither the means nor the experience necessary to develop t industry. The Government pomologists have lately been urgi the growers to adopt a different system. The energetic M Blackmore has this season been visiting the orchards of bo islands, and his advice may be summarised in a few wor "Plant late apples; nothing but late marketable apples. Pla acres of them. Plant only a few varieties, and get your neighbo to plant the same varieties. Then it will be worth while for dealer to come into your district and buy the crop, instead being confronted with never more than thirty or forty cases a sort at any time during the season."

Mr. Blackmore, being a vigorous advocate of spraying, is n dismayed at the codlin moth. In dealing with this pest a Ca fornian pump called the bean is coming into great favour. was first sent to New Zealand by Professor Wickson, aft whom the latest and best of all Burbank's wonderful Japane plums is named. Its cost is £7 10*s*. Its good points are i enormous pressure per square inch—on which the force a fineness of the spray depend—and the fact that it can be work single-handed, the operator being free to hold the nozzle un the compressed air cistern needs refilling. The codlin moth la her 200 eggs in the eyes of 200 apples, and the progeny's chan for life depend on his getting through the skin of the apple at spot where the spray has not fallen. The liquid used is dilut

Paris green. If the grub which hatches from the egg should get through the apple skin without tasting the Paris green, he makes a bee line for the pips, without which he cannot develop. Having sampled these and filled the core with excrement, he eats a way out through the side of the apple, and makes a cocoon in a crack in the bark of the tree or some other sheltered place, where, if it is not near winter, he becomes a moth in about a fortnight, and the business is repeated. Leading growers, in addition to spraying, tack a narrow strip of sacking round the stem of the trees. These attract the grubs, and about every ten days they are examined and the grubs are killed.

In pruning orchard apple trees and pear trees the twelve-branches or Tasmanian system is considered the best. The result of the system is to make the tree open in shape and productive of heavy crops, good fruit, and fruit that can be easily reached. For shaping on this method yearling trees are planted. Three shoots are grown during the first season. These are pruned back to three or four buds in the winter, and two shoots from each are grown in the next season. The following year the process is repeated and then there are twelve branches. The tree is then complete. Future pruning has the object of confining all the fruit to these branches, and summer pruning effects this purpose. Just before the crop is gathered, the shoots which grow out all along the twelve branches with any other laterals are shortened to four or five buds. These short stumps do not grow again, but become fruit spurs. The terminal shoots of the twelve branches, however, are always allowed to grow unchecked till the winter. They are then shortened to induce a new bud to push into growth at the end with renewed vigour next spring. Trees of a spreading habit are cut to an upper bud, and those of upright growth to an outer bud. The Tasmanian orchards pruned on this system or a modification of it present a very effective sight, with the long rows of trees each throwing out its twelve long arms of fruit. The fruit-packer greatly appreciates this style of pruning, too, and it is found that the more the fruit is borne on the main branches—as it is bound to be by this plan—the finer it always is. And it will weather much heavier winds.—A. G. S. —*Field.*

GONDAL FLUID FOR WHITE ANTS.

In No. 18 of the 1897 (published in 1898 and just issued) of the *Agricultural Ledger,* we find some interesting notes on white ants. Practical men, planters and ryots alike, have always held that white ants will attack living plants, whereas scientists, or pseudo-scientists, have gone to considerable trouble in reasoning that they do no such thing. That in fact they only feed on the dead dissues of plants, following up the injury caused by borers and other insects. Among other evidence, that from the Settlement Officer of Balaghat, Central Provinces, is worth noting :—

> The cause that led me to this perception of the truth is that I have attempted to raise a row of half a dozen mango trees close behind my bungalow, and I have had a number of the saplings die, they being in most cases attacked by white ants. I have dug up three of the trees in different stages of the white-ant disease. One of the plants was almost dead, and it would have been difficult to prove that the white ants were not innocent scavengers, removing useless dry wood. Another tree was half-dead, and the theory that exonerates the white ant from the charge of devouring living timber could only be maintained by crediting the termite with a marvellously accurate prophetic instinct that told the scavenger which of the trees were already doomed to die and might be removed as useless, for the tree was not yet dead but only likely to die shortly. In the third case the tree still looked quite green, save for a suspicion of unhealthiness about some of its leaves, and on digging it up I found that its roots had been eaten through in places by white ants, and that a detachment of the voracious termites was actually pushing its way up the heart of the sapling, eating its path through perfectly good, juicy wood. The sight of a channel about $\frac{1}{8}$th of an inch wide thus eaten out up the very centre of a sapling appeared to me to be conclusive proof that the mango tree was dying from the attacks of white ants pure and simple, and that the theory I had heard put forth in the name of Science by a Forest Officer was untenable. That theory appears to me to confuse two cases : (*i*) that in which white ants attack young trees a few feet high, eating out the heart of the tree, full of sap though it is, and doing their work of destruction unseen below the surface, and (*ii*) that in which white ants ascend the *outside* of a tree in search, presumably, of dead branches on top.
>
> The attacks of the first of the above kinds are not confined to young trees. I have found fields of *tur* in which a number of the plants have withered owing to the roots being eaten up by white ants, and in gram fields also I have had similar damage pointed out to me.
>
> If, then, it be considered as proved that white ants do considerable damage to horticulture by attacking the roots of living trees, the question of finding some preventative against their ravages becomes one of practical importance. I have made enquiries as to remedies against the attacks of termites, and found that the popular preventatives are numerous and not usually efficacious.

In noting the above, Dr. Watt, who has always held the scientific theory anent the method of their attacks, suggests the trial of the Gondal fluid recommended in his notable work on "Tea Pests and Blights." For the sake of those who do not possess a copy of this valuable work, we extract the following paragraphs dealing on the preparation of the point. "During a brief visit to the Native State of Gondal, the writer recently gave this subject (*i.e.*, the value of Al. dye *Morinda citrifolia,* in keeping off white ants) considerable attention. There seemed to be no doubt that His Highness the Takore Sahib, by his enlightened action in this matter, had effected a radical improvement. The trees throughout his State were all painted as described above (*i.e.*, to a height of 3 feet above the ground), and not a single tree could b e found that showed the mud encasements so characteristic of the presence of white ants. And very possibly, as a consequence of the care bestowed on these trees, they were healthy and vigorous, while those in neighbouring States were sickly and badly attacked with white ants. In consequence of these observations the writer asked for information as to the composition of the paint that had been used. He was informed that the red colour was merely to indicate that the trees had been painted, and that it was for the most part red ochre, but might be also made out of the refuse of the Al Dye works. The useful ingredients were said to be as follows :—

One part *dakamali* gum (the resin of *gardenia grunmifera* or *G. ludica* [Canarese Bikke, dikkemali kambi :—Ed., *P. O.*])

Two parts asafœtida or *hingra.*

Two parts bazaar aloes or *musubar.*

Two parts castor oil cake.

The *dakamali* gum, which is known all over India by that name, has a most offensive smell, resembling cat's urine. It has a marketable value in Mysore of Rs.3-12-0 per maund of 37½ lbs.

The ingredients are well pounded, mixed and kept in water for about a fortnight. When thoroughly united, and what may be called decomposed, into a thickened compound, water is added in order to bring it to the consistency of paint, and the colouring matter is then added.

The mixture is now ready for use, and, if thoroughly applied for about 2 feet, will check the attacks of white ants, and many other insect pests. Its effects will last for two years or more. The cost of the preparation comes to about 4 to 5 rupees per 100 trees.

The ingredients, which are readily procurable, are cheap and perfectly harmless. The effects of one painting are said to last for one or two years. Dr. Watt recommends that, in the case of tea, infested bushes should be thoroughly cleaned, to have the earth around them deeply hoed, even at the expense of cutting some of the roots, to have all ant nests removed when found, and to have the stems and branches, even some inches below ground, and for 2 feet above, thoroughly coated with the Gondal preventive paint.

The paint, by the way, is also very useful in painting pruned stumps or branches, both to preserve the surface from the effects of the weather, and to prevent boring insects attacking the wounded parts.

THE LADY-BIRDS AND COFFEE IN S. INDIA.

ADVERSE OPINION ON MR. NEWPORT'S MISSION.

THE following has been published by request in the Ceylon papers :—

THE Madras Government has communicated copies of correspondence received from the Secretary of State for India on the subject of the deputation of Mr. Newport to India for the purpose of obtaining lady-birds. The following is the correspondence referred to in the proceedings of the Madras Government:—

Read the following despatch from the Right Hon'ble the Secretary of State for India, Revenue, No. 4, dated 28th April, 1898:—I forward herewith a copy of a letter received from the Director of the Royal Gardens, Kew, and of its enclosure from Professor Blanford, offering some precautionary observations which may be useful on the subject of Mr. Newport's deputation to Australia for the purpose of obtaining a consignment of certain species of lady-birds. I am aware of the circumstances in which Mr. Newport was selected for this duty in the absence of a skilled entomologist.

Enclosures: Letter from the Director of the Royal Gardens, Kew, dated 17th March, 1898.

1. I have before me the proceedings of the Government of Madras, G.O., 351, 18th May, 1897, and G.O., 28, 17th January, 1898, of which I have received copies through the Secretary of State in Council.

2. It appears from these that coffee in the Madras Presidency is affected with scale bugs and other insects. To remedy this state of things it has been decided by the Madras Government to pay Rs.2,000, a moiety of the expenses of the delegation of Mr. Newport to Australia, to collect and carry to India a consignment of lady-birds.

3. The principle of dealing with scale bugs by introducing their appropriate enemy has been worked out by American entomologists and is undoubtedly sound. But as pointed out in the papers there are 1,700 known kinds of lady-birds and for the most part each of these will only feed on one kind of scale insect. The method therefore will obviously not work unless the appropriate enemy is set to work on its destined prey.

4. As it appeared to me doubtful if this point had been adequately considered by the Government of Madras, I obtained the opinion of Mr. W. F. H. Blanford, one of the Secretaries of the Entomological Society. This I enclose.

5. I may be permitted to observe that it appears to me improbable that any attempt to utilise these refined entomological expedients will lead to anything except waste of money, and perhaps as Mr. Blanford points out worse mischief unless carried out by a competent expert.

LETTER FROM MR. W. F. H. BLANFORD, TO THE DIRECTOR THE ROYAL GARDENS, KEW, DATED 15TH MARCH, 1898.

With respect to the support which the Government of Mad giving to the United Planters' Association of Southern Ind order to send Mr. Newport to Australia, for the collection of birds, it is clear that the Government and the planters are re on the success of the Hawaiian and American experiments i same direction.

I have looked up as much information as I can find of wha been done in this direction, and it appears that certain Austr lady-birds (of the genera Chilocorus, Orcus and Cryptolæmus) been found to attack and feed on species of Lecanium Insect IV., 164-165.

Although the official papers are silent on the point, it may ferred that the destructive coffee-scale of Southern India is *Leca viride* first described by Mr. Green from Ceylon. It is ther quite within the bounds of possibility that Mr. Newport may pr a return for the Rs.5,000 by bringing back lady-birds that will be useful in India.

At the same time, though not necessarily foredoomed to failur experiment is being carried out on quite unscientific lines.

No study appears to have been made of the Indian parasit Lecanium viride. Whatever the native home of this scale may is presumably not Australian, as was Icerya purchasi; ther plenty of Indian lady-birds, which perhaps already accomplis the destruction that imported kinds could do.

The success of the "Vedalia experiment" has given rise to a of delusion that one must, inevitably turn to Australia for coccid agous insects; and it is worth pointing out that *Icerya ageyptia* Dougl, which has been introduced into India, was found in 18 be attacked in the compound of the Indian Museum, Calcutta, b indigenous species of *Vedalia V. funida roseipennis*. In this the introduction of the Australian *V. cardinalis* would have utterly unnecessary.

In considering the chance of success of such experiments, well not to lose sight of considerations thus expressed by Rile a paper which lays down authoritatively the principles of such ec mic methods (Insect Life, 130, *et seq.*) There is very little to be h from the miscellaneous introduction of predaceous or para insects for the suppression of a phytophage which they do suppress in their native home or in the country from which they brought. All other things being equal, we should expect the spe beneficial in Australia to be less so when brought to this cou (America), a deduction which brings out still more clearly the ex tional nature of the case of *Vedalia* and *Icerya*.

Whatever good result the present experiment may have depend on Mr. Newport's capacity for carrying it out, and as Planters' Association has vainly asked for the services of a ski entomologist, he must be presumed not to be one.

To study and collect suitable predaceous species from among various Australian Coccimellidæ appear to me to be no easy even for an expert, and to be probably beyond the powers of a entomologist.

The selection of the species is only an initial difficulty; poss injurious forms must be eliminated, a point on which Mr. Koe who introduced *Icerya* into America, was specially cautioned. examples collected must be brought back alive, and sufficient in tigations of their life history, &c., made to enable this to be d Moreover they must be fed during the voyage on Australian sc insects, unless Mr. Newport exports with him a supply of shi infested with *Læcanium viride* on which to test and subseque to rear the lady-birds. In either case there is a risk that unski management might introduce an Australian scale to India, or *versâ*, which would be a most lamentable outcome of an ill-conside experiment.

Order thereon, Misc. No. 2294, dated 26th May, 1898.

Copies of the correspondence received with the Right Hon'ble Secretary of State's despatch read above will be communicate the United Planters' Association of Southern India.

THE WORK OF LADY-BIRDS.

Report of Prof. Albert Koebele, Entomologist of the Hawaiian Government.

Honolulu, *December* 31, 1897.

Jas. A. King, Esq., Minister of Interior. Sir,—I have the honor to submit herewith my report for the two years ending December 31, 1897.

As you are well aware my first and chief work had to be directed against the numerous scale insects at the time infesting and destroying many of the valuable fruit, ornamental and shade trees. Up to the present time, some sixty species of these have been found on the islands, and some of them would have made it utterly impossible to raise the citrus and coffee trees successfully! in fact, most of the shrubs and trees at the time were so infested by the then recently introduced and most pernicious coccids ever met with, Dactylopius vastator, Mask, that their destruction in the near future seemed imminent had not relief been brought. Without doubt their destructive work would have spread over all the islands, notwithstanding the most diligent prevention on your part. The scale had not been met with as yet in any of the other islands, and at present wherever it may appear, its enemies are awaiting it, the chief of which no doubt is the Australian Lady-bird, Cryptolæmus montrouzieri. Mulsant. The coccid is a native of China where it had been met with in the neighbourhood of Hong Kong.

Another numerous scale, and one that had longer been introduced than the previous species, Dactylopiusceriferus, Newstead, had always been seen covering the leguminous trees often to such an extent that many of them lost their entire leaves and in some instances even were destroyed entirely by the quantities of mealy bugs present. This species also is kept in check by the Cryptolæmus beetles, which increase to such an extent in the early summer that millions of their larvæ can frequently be seen crawling around where the coccids abound. Often this very beneficial insect, for it is always in larval state where they do the most execution, are taken for so-called blights and are in consequence destroyed. It should always be borne in mind that the scale insects or blight are generally stationary, *i.e.*, fixed to the branches and twigs of plants, very rarely move about, and then only very slow; the Cryptolæmus larvæ on the contrary is quite active, and when full grown is about a quarter of an inch in length, covered above with six rows of contiguous elongated white mealy secreted appendages. It is then that they can be seen in such numbers that often the fences and walls are covered, the trunks and limbs of trees bear patches of the pupæ, often several feet in length. The insect was met with in tropical Australia, New Caledonia, Fiji, Ceylon and Southern China, and will apparently live out of doors in the tropics only.

Another Dactylopius has occasioned great inconvenience in the cane fields, known as D. chalceolariæ, Maskell. Here also the Cryptolæmus beetle appeared, and waged war upon the same with the consequence that at the present time the pest has also practically disappeared. This scale was met with in Fiji and tropical Australia.

Dactylopius adonidum, Linnæus, has ben present upon most all plants. It is this scale that has marred the coffee industry in the islands ever since the attempt was made to grow the tree over fifty years since, by its large numbers sitting around and sucking out the sap of the young berries, producing a premature colouring and dropping of the same. It likewise lives upon the roots of coffee and many other trees and plants in the tropics all over the world, whilst in colder countries it is found upon greenhouse plants chiefly. The injury to the various vegetation formerly caused by the foregoing and many other species of Dactyloplius present on the islands is now practically done away with, we have sufficient enemies present for them for all time to come.

Pulvinaria psidii, Maskell, another introduction from the Orient, had spread considerably over the islands, and caused some anxiety, especially in the coffee districts. I myself must confess that nowhere have I ever seen a landscape so completely blackened by the fungoid growth, caused by the honey exudation of the Pulvinaria scale in which this grows, as that of North Kona on my visit in February, 1894. On my recent trip to the same place, all this had changed, and the district, to me, had the appearance of another country, all owing to the presence of the Cryptolæmus beetle that devours the eggs of the scale. Since then various other species of lady-birds were sent there, and still more will be sent all of such that will prey both upon the eggs and mature insects.

The rose apple, Eugenia malaccensis, was still found covered by the black fungus. Here another tropical scale, Lecanium acuminatum, Signoret, is present in large numbers upon which the Cryptolæmus beetle will not feed, yet many other lady-birds have been sent that will feed on this and all species of Lecanium. The above scales have so far been the most numerous and destructive, yet other forms as well have been on the increase and I can give a short account of some of them only, as many of the species are not yet worked up.

Aspidiotus aurantii, Maskell, is injurious to citrus trees chiefly in temperate zones and may have come upon those trees from any port in California, Australia, China, or Japan. It was found upon recently introduced Potocarpus plants from Japan. The climate of Honolulu appears not to be suitable for the same as it was not met with in the tropics as injurious to citrus plants. At Sydney it was found upon Perea carolinensis, Laurus nobilis; Brisbane, numerous upon Jasminum; at Rockhamsden on wild fig tree; Cairns, cultivated figs and Morus sp. In Ceylon on Agave (Green); Hong Kong on Paliurus ramosissimus; Litsea sebifera, Hedyotis acutangulus (very numerous), Stillingia sebifera; on Melia azedarach at Amoy, Swatow, Hong Kong, Formosa and Honolulu; Japan on Potocarpus and Damara like trees, also many other plants. One Chalcid parasite Aspidiaphagus citrinus, Craw, is preying on the same in China, Japan and California.

Aspidotus cydoniæ, Comstock, was found on a garden plant at Paia Maui, and upon Ake at Honolulu.

Aspidiotus longsipinia, Morgan, infests trunks and branches of Orange, Lemon, Mango, Kukui tree, Figs, Pride of India, etc., on all the islands and even a common weed at Lihue, Kauai. The scale was found at Tamsui, Formosa, on Orange and upon Fig trees at Hong Kong. A large number of the scales are punctured with holes from where a minute Chalcid parasite has issued that keeps the scales in the islands in check.

Aspidiotus duplex has been repeatedly introduced on Camellia from Japan where it also is found upon the tea and other plants it has yet not become injurious on the islands.

At Makaweli, Kauai, Aspidiotus camelliæ and A. nerii were found upon imported American apple, pear and peach trees in such numbers that some of the trees had died. A number of other species of Aspidiotus were met with in the island, all of them introduced.

Of Parlatoria, P. zizyphi is the most numerous upon citrus and other trees in Honolulu. P. pergandei is as yet not so numerous. The first was found at Hong Kong and Canton infesting citrus trees, and the second upon Enonymus at Yokohama and on Camellia at Macao. Mytilaspis citricola, Packard, is the scale at present found so numerous upon citrus trees at Honolulu, where it had spread within two years. A number of introduced lady-birds are preying on the same, and as far as my observations go, I believe that in time they will effectually keep the same in check. The scale also infests Groton and other plants. It is common most everywhere in the world. It is found in the Kona (Hawaii) district, but not numerous. Mytilaspis gloverii, Packard, has at present only been met with in a citrus tree in Mr. Jordan's yard. The tree had been imported from Japan or China where the coccid is numerous, and with the foregoing one are most destructive to citrus plants.

Mytilaspis pallida, Green, has been found upon imported Japanese Potocarpus plants. Mytilaspis flava, Targioni tozzetti, was met with upon bark of various shade trees at Makaweli, Kauai, and in China upon Pyrus sinensis (Hong Kong). Mytilaspis pomorum, Bouche, the apple bark louse, was also found on imported American plants at Makaweli, Kauai. Diaspis rosæ, Sandberg, is the common rose scale and is found all over the world. Diaspis boisduvalii, Signoret, has been found on imported orchids.

Chionaspis biclavis, Comstock, is found over all the islands on bark of various trees and always badly parasitical. It is not serious in consequence. It may have come from any of the South Sea Islands or Asia. Chionaspis eugeniæ, Maskell, is a widely distributed species, it occurs in Australia, Ceylon, China, and Japan and lives upon very many plants. The scale has been doing well with Mr. Jordan, upon imported Japanese Magnolia and Eugenia.

Chionaspis prunicola, Maskell, Diaspis patelliformis, Sasaki, Diaspis amygdali, Tryon, has been found upon imported Japanese plum trees that had died from the effects of the scale which appears to be very injurious in some temperate zones. It is still present upon a Japanese pear tree on same place at Honolulu. In Ceylon

it was found on bark of Aleurites triloba, at Hong Kong, on Rhus sp. Amoy, on peach, on the same tree at Formosa and unknown wild shrub, in Japan always on Pyrus, Prunus and Morus, on Juglans, Elæagnus, Ribes rubrum, Salix, Sterculia plantanifolia, Fraxinus, Orixa japonica and many other trees and shrubs. While I anticipate no serious trouble from this coccid in the islands, yet it should not be allowed to get a foothold, and should be stamped out in the beginning.

Fiorinia camelliæ, Comstock, was first noticed upon imported Japanese Potocarpus. It is found most anywhere and has been met with in Australia on many plants, in Ceylon on Mistletoe, on Oleander at Amoy, in Formosa on Psidium and Juniper, Japan on Potocarpus macrophylla, Sciadopytis verticillata, Camellia, Enonymus, etc.; on Alligator pears, palms, Camellia, etc., on Honolulu. Aspidiophagus citrinus, Craw, is preying upon the same.

Ceroplastes rubens, Maskell, was found but sparingly in the beginning of 1894, yet at the present it may be seen anywhere and upon most any tree in Honolulu, although numerous, it is not very injurious compared to other scales. The insect no doubt was introduced with plants from China as it is quite common around Hong Kong and there lives chiefly upon the various pine trees. In Ceylon it was found upon Jambosa vulgaris. Two species of Chalcid parasites live upon the same in Honolulu, viz., Tomocera Californica, How, and Coccophagus sp. A third species that is preying upon Ceroplastes floridensis, Comstock, in Japan, has been introduced in some eighty specimens of both sexes.

Both Ceroplastes ceriferus, Anderson, and C. floridensis have, at innumerable times, been brought in on plants from Japan and China, yet none of these appear to be established.

Lecanium acuminatum, Signoret, is present on many plants in the islands, yet chiefly upon limes and lemon. It is always badly parasiteized in Honolulu by two species of Chalcid flies.

Lecanium filicum, Boiduval; L. Hemisphæricum, Targioni, Tozzetti; Lecanium coffea, Nietner, is found upon very many cultivated and wild plants throughout the islands, and is preyed upon by internal parasites; it is found common all over the world, chiefly so in the tropics.

(*To be Continued.*)

FAIRLY WELL ISN'T WELL ENOUGH.

Let us say that your wages are twenty shillings a week. You have worked hard, done your best, and feel that you have earned your money. Very good. Now imagine that when Saturday night comes your employer hems and haws, and wants to put you off with fifteen. I'll be bound you would think yourself hardly treated. What are the great strikes in this country commonly about? Why, in some fashion they are about wages or hours; it comes to the same thing. Be it understood that the writer uses this fact as an illustration of another fact—that is all. What is that other fact? We will work it out of the following personal statement.

"Nearly all my life," says Mrs. Sarah Dalby, "I have been subject to attacks of biliousness, accompanied with sickness, but got on fairly well up to the early part of 1882. At this time I began to feel heavy, dull, and tired, with an all-gone, sinking sensation. My skin was sallow, and the whites of my eyes of a yellow tinge."

As everybody knows, or ought to know, the colouring matter was bile. The liver being torpid, and, therefore, failing to remove the bile from the blood, it entered the skin; and showed itself on the surface. But the discolouration isn't the worst mischief done by the vagabond bile, containing many poisonous waste elements; it disorders the whole system and sets up troublesome and dangerous symptoms, some of which the lady names.

"I had a bad taste in the mouth," she goes on to say; "and, in the morning particularly, was often very sick, retching so violently that I dreaded to see the dawn of day.

"My appetite was poor, and after eating I had pain at my chest and side. Frequently I couldn't bring myself to touch food at all; my stomach seemed to rebel at the very thought of it."

[This was bad, but the stomach was right, nevertheless. More food would have made more pain, more indigested matter to ferment and turn sour, more of a load for the sleepy liver, more poison for the nerves, kidneys, and skin. And yet, *without the food*, how was she to live? It was like being ground between the upper and t nether millstones.]

"After this," runs the letter, "I had great pain and fluttering the heart. Sometimes I would have fits of dizziness and go into a faint, which left me quite prostrated. Then my ner became so upset and excitable that I got no proper sleep at nig and on account of loss of strength I was obliged to lie in bed all d for days together. I went to one doctor after another, and attend at Bartholomew's and the University Hospitals, but was none t better for it all.

"In September, 1883, my husband read in *Reynolds' Newspa* about Mother Seigel's Curative Syrup, and got me a bottle of After taking it for three days I felt relieved. Encouraged a cheered by this I kept on taking the Syrup, and in a short time the pain and distress abated, and I was well—better than I h ever been. That is ten years ago, and since then I have never ai anything. With sincere thanks, I am, yours truly (Signed) M Sarah Dalby, 93, Tottenham Road, Kingsland, London, N., Janua 2nd, 1894."

Now run your eye back to the first sentence of Mrs. Dalb letter, and you will come upon these words, "*I got on fairly we* &c. *This* is the sad thought. Her life has always been at a d count; she has always got less than her due; she lost part of h health—wages. Do you take my meaning? Of course. Whatev may be our differences of opinion as to the rights of capital and t value of labour, it is certain that every human being is entitled perfect health—without reduction, without drawback. All t more, as nobody else loses what one person thus gains. No, no. the contrary, a perfectly healthy person is a benefit and a blessi to all who are brought into relations with him.

But do all have such health? God help us, no; very, very fe Why not? Ah, the answer is too big; I can't give it to-day. the vast crowd who only get on "fairly well" I tender my sympath and advise a trial of the remedy mentioned by Mrs. Dalby.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (June 17, 1898) says:—

The market at Public sale has again been easier as the demand proved quite insufficient for the enormous supplies which still continue, and prices generally show a further reduction on the week.

About 2,800 bags East India were offered, consisting chiefly of small lots of undesirable qualities, which met a slow demand at fully 2/- decline whilst a large proportion was bought in.

The large quantities of Central American catalogued met little competition and sellers had to accept a further fall of 2/- to 3/- for what was sold; one or two fine colory parcels however realised very full values.

Futures have also been easier and business very slow; quotations at the close being 6d. to 9d. lower since our last.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending June 16th, 1898, says:—Bank rate 3%. Bombay Exchange closes at 1s. $3\frac{1}{16}$d. Brazil Exchange $7\frac{2}{32}$d. Rupee paper $3\frac{1}{2}$% $62\frac{1}{2}$. Silver $27\frac{7}{8}$d. per oz.

The heavy quantities catalogued since our last Report have only partly been disposed of at easier prices, most kinds being difficult of sale at an irregular decline of 1s to 2s per cwt., and in some cases more. Should importers continue to press the Coffee forward, values will no doubt go down, the Trade at the moment having bought freely during the past few months, and being well supplied. Fine qualities which are scarce continue to be well competed for, but all other kinds are difficult of sale.

The Dutch sale of 20,494 bags and 28 cases held yesterday in Rotterdam went off at an irregular advance of 1 to $2\frac{1}{2}$ cents, good ordinary Java selling at 35 cents, against $33\frac{1}{4}$ cents last month.

Brazil markets are dull.

Daily receipts averaged 6,500 bags in Rio and 4,300 bags in Santos.

Futures have ruled quiet and lower, closing at 9d to 1s per cwt. decline, viz.:—Good average Santos in Havre, September delivery, fcs. 36.50, in Hamburg pf. $30\frac{1}{4}$, and No. 7 low ordinary Rio in New York $5.75.

To-day's London official quotations are:—

	June	July	Sept.	Dec., '98.	Mar.	May, '99.
Santos ...	29/3	29/6	30/-	30/6	31/-	31/-

Indian. Amongst the small quantity brought forward, 1,509 packages of New Season's Tea were included; these sold with spirit at satisfactory prices, the following being some of the averages obtained:—"Budla Beta," $1/3\frac{3}{4}$; "Eastern Assam C Balijan," $1/0\frac{1}{2}$; "Assam Fron. C Hilika," $11\frac{1}{2}$d.

For Old Season's Tea, bidding was also good and prices showed a slight improvement here and there, although no material change has taken place in quotations. The official wire gives exports to U. K. for first half of June as lbs. 3,750.000 against lbs. 3.115.000 last year, and from 1st April to 15th June, lbs. 6,457,000 against lbs. 6,294,000 for same period last year.

Week's avg. of New Season's Tea sold on Garden Account, 1898, 3,341 pkgs., av. 7·38d. 1897, 4,377 pkgs., av. 8¼d.

Ceylon. Although the sale was comparatively heavy the market was animated, the chief demand running on good liquoring Teas over 10d. and the lower grades of whole leaf Teas. For these, competition was keen and dearer prices were occasionally obtainable. For medium grades, especially Pekoes, the market was weaker. Owing to the fire at Hays Wharf several invoices were withdrawn. Private telegraphic advice gives the quantity exported to U. K. for first half of month as lbs. 4,500,000 against lbs. 55,20,000 same time last year. Avg. price 7·58d. agst. 7½d. same week 1897.

Ceylon Tea sold on Garden Account 1st Jan. to date 1898, 517,5 pkgs., av. 7·64d. 1897, 505,717 pkgs., av. 7·79d.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," 11/12, Second Line Beach, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 11 and 12, Second Line Beach, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 22nd July, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Pollibetta, 13*th July.*—*Weather.*—The monsoon has dried up entirely now. Since Sunday we have had hardly any rain to measure. Work on paddy fields is retarded. *Crops.*—This weather, no doubt, has been the salvation of the crop; but now even the crop wants rain. Supplies want it badly. The N.-E. rains cannot be depended on here. *Works.*—Nothing beyond weeding, supplying, handling and destroying borer. *Labour.*—Hardly any Canarese have begun to come in anywhere. *Health.*—Continues good.

Nellampatty (British).

13*th July.*—*Weather.*—Since my last report had been splendid for everything, save health, it would seem. Dull days with perhaps a glimpse of sunshine now and then, while every day at some hour a little rain has fallen, and to all appearances this sort of weather is to continue. Rain for fortnight 8·8 inches, to date 44·8. *Crops* are showing up a little more now that fields are being handled, and although blossom estimate won't be reached, still in most cases, I think a little over second estimate may be counted upon. *Plant-diseases.*—"Leaf" showing in patches on some places, on others not a sign of it, and coffee looking very well indeed. *General Health.*—Very bad. Coolies are suffering from colds and fever very much, and some Europeans are also down. *Labour.*—Plentiful on some places, short on others. Coolies seem to be very independent this year and much more troublesome than usual. Would your other correspondents say if this is found in their districts?

PLANTERS AND EXCHANGE.

II. SOME POINTS FOR LOW EXCHANGE.

WE can readily imagine some readers exclaiming, after perusal of "Some Points for High Exchange," "Skittles!" Precisely. The skittles were set up for the simple purpose of being knocked down again. That is one of the main reasons, not only why skittles usually are set up, but also why many arguments are set up. They have to be marshalled in line. Then comes the adversary, and down the whole series go like a set of ninepins at the touch of a cleverly pitched ball. And so it is in the present instance. To advance the cause of low exchange, we must upset that of high exchange. We cannot directly meet the argument about Home Charges. There can, unfortunately, be no question that a low exchange must cause an enhancement of these for many years to come. But *indirectly* even this difficulty can be met. A country that is prosperous can face smilingly debts that would confound a unprosperous country. If, therefore, it be shown that low exchange means to India prosperity and wealth, then something will have been effected towards showing that India prosperous can meet enhanced Home Charges with less difficulty than India unprosperous has with respect to Home Charges on a lower scale. It would, however, be impossible for us to establish in the brief space at our disposal such an important issue as this. We must appeal to the experience of our readers. Have they found a high or a low exchange more favorable to their prosperity? If the latter, then we may fairly assume that the Indian cultivator has had similar experience, and no one can deny that it is the Indian cultivator who chiefly contributes towards the building up of India's *export* trade, and that this has long bulked larger than the *import* trade of the country. True, the cultivator must be called upon to pay increased wages. It is because in so many instances Government has no power to levy this extra taxation, that an unfair burden falls upon others. The Permanent Settlement has much to answer for, and its influence on the Currency Question is by no means unimportant.

Now, as to Sir JAMES MACKAY'S argument about prices. Let it be admitted that the fall in prices in London is due partly to increased competition, and we may assume that—in respect of tea, at any rate—it is partly due to the fall in exchange also. What then? Sir James asked if men could say that low exchange had done anything to keep up prices? Certainly, it has, *in India*. It has not kept up sterling prices, but it has unquestionably propped up the rupee values of tea, and it is the rupee values that regulate the returns to the pockets of planters. Note what the Ceylon Silver Currency Commission reported in 1894: "At the present moment it may be calculated that tea has become, since 1888, worth to the producer almost as much as coffee used to be worth in the days of its greatest prosperity, while the value of other commodities exported has more than doubled." Again, "we are of opinion that the low price of silver has stimulated the production of many commodities, and that the increased production so caused has naturally tended to lower prices, but on the question of a direct connection between the price of silver and that of other commodities our views are identical with those expressed by Lord Herschell's Committee." These were that having regard to the phenomena presented in the case of Indian products not greatly open to competition, and to the necessary effect c competition in the case of those which are within the sphe of its influence, it seemed far from clear that the fall in th gold price of Indian products would have been materiall less if the exchange had not fallen. And the Ceylon Com mission rightly said that the figures before them indicate generally a considerable degree of prosperity in all classe of producers for export. Although, therefore, the argu ment about the capital value of an estate is one that can b twisted in many ways, there is strong reason to believe tha Sir JAMES MACKAY expressed a perverted view of it in th remarks quoted in our last. It may be granted that at time when Exchange was to say, half masted, the capit value of many estates in India, worked out in sterling, wa below cost. But is this the case now? There may be badl managed or unfortunately-situated estates that would a ford a basis for the high-exchange advocate to work upo But, speaking generally, estates have prospered of late year and have at least recovered the full sterling value tha would have been put upon them if purchased when th rupee was at par. It is a fact that many men have not onl reaped a handsome income year after year, but that some c them have sold out at splendid prices, and even realisin at very low rates of exchange have made sure of a sterlin capital far above the amount originally invested.

Personalities in matters of this kind are not desirabl yet they are often very effective. If permission could b obtained to cite before the Currency Committee a few cas in point, these would go far towards establishing the trut of planters' assertions that an inflated rupee is a bugbear t them, and an unnaturally depressed rupee a help. At th same time, they could hardly hope to gain anything b asking for the latter. What they have to aim at is natural rupee, neither inflated nor deflated. They wan fair-play; and if artificial propping up of the rupee does no give them this, they must do their utmost to prevent it. a few instances could be put before the Committee of me who had realised during a period of low exchange and ha withdrawn a full sterling capital notwithstanding th exchange, something would have been done towards upse ting the plausible arguments of such men as Sir JAM MACKAY. What the planter must show is, that during perio of low exchange the planter has done better than durin periods of high exchange. That this has been the case f the most part can scarcely be denied.

A SALTPETRE REFINERY FOR PLANTERS.

WE publish to-day an interesting paper by a well-know planter of South India, headed "A Co-operative Saltpet Refinery." "Toda," for that is the name under which h conceals his identity, proposes a somewhat novel schem namely, that planters should themselves conbine to start refinery in a suitable locality, and supply themselves wit abundance of good and cheap nitrogenous and potass manure in the form of nitrate of potash, commonly know as saltpetre. The article was suggested by some remark of ours in last week's issue, advising the more general u of such an excellent and cheap fertilizer.

"Toda" proposes that some such suitable locality Coimbatore or Trichinopoly be chosen for the site of the e periment, and suggests that a few estates should subscri

the necessary funds. As "Toda" only estimates these at some Rs.1,250, there should not be much difficulty in raising the funds. There are, however, a few points which require to be cleared up, the elucidation of which would go far towards making the scheme a success, and an early one. Before actually starting the refinery, careful investigations should be carried out on the spot. The three main points that require to be settled with some approach to accuracy are, first, the cost of erecting the necessary "plant;" secondly, the cost of the manufactured article; thirdly and lastly, its manurial properties, as determined by chemical analysis. We have not the slightest desire to throw cold water on the scheme; on the contrary we are anxious to render it all the support we can. But it is a sensible proverb that says: "Make haste slowly." Saltpetre refineries, whether co-operative or not, are commercial ventures, and it would be the height of folly to rush an undertaking of the kind. From what "Toda" says, and from what we have ourselves gathered, the actual factory need not be anything very expensive or elaborate. The cost of production is a more important point, and cannot be settled except by careful enquiry on the spot. Lastly, chemical analysis must determine the real value of the manufactured article, samples could be easily procured from native refiners, and sent to Madras or elsewhere for examination. It is useless to quote English analyses, as the purity and value of the nitrate depend largely on the amount of care, and consequently cost, expended on the refining process. If the proposed refinery is to work on native lines, native-made samples must be obtained. "Toda" says he will willingly undertake the starting of the scheme in person, so long as his personal and travelling expenses connected therewith are defrayed.

These preliminary investigations could easily be carried out for, say a couple of hundred rupees at the most, and we trust this amount will be readily forthcoming. In connection therewith we shall be glad to forward to "Toda" any letters on the subject.

We may mention, by the way, that the prices quoted by us last week for "crude saltpetre" were taken from market price lists.

NOTES.

Rivals. Japan is pushing tea; the Transvaal is doing its best to foster the cultivation of coffee. All the more reason why Indian planters should push for *New Markets*. That is one of the chief points to be kept in view. The Newmarket Stakes should be popular, in fact, and we should be very glad if there were a favourite to be named. Who enters?

Mangosteen plantations. When we consider the great scarcity of this delicious fruit in South India, and the consequently exceptionally high prices it commands, it is not a little curious that so little attention has been paid to its cultivation and growth. Seed can be obtained just now in almost any quantity,—though by no means cheap, as the fruit is so expensive,—from the Curator of the Government Gardens, Ootacamund. In our next issue we hope to give a few interesting details on questions connected with its growth and cultivation. There is a lot of money in tropical fruits, much more so than planters have any conception of.

Coffee Stenophylla. The *Kew Bulletin* prints a letter from Hartoof, Trinidad, in which the merits of this species, a native of Sierra Leone, are pointed out. The berries are dark purple, not red, and the flavour of the prepared seed is excellent; steps have been taken to introduce it into other West Indian islands. The experiments carried out thus far in Bangalore, Burliars and Coonoor certainly do not point to the advisability of extending the trials with this variety in South India. A feeble, many-stemmed growth of a foot or two at most has been all that has rewarded experimenters at the above stations, even after a couple or more years' trial. At Calicut, we believe, *Coffee stenophylla* has been more successful.

Hybrid coffee. We reprint elsewhere an interesting article that recently appeared in the *Madras Mail* on certain wonderful results alleged to have been obtained from hybrid coffee trees in the Wynaad. The article itself is a very readable one, but we confess we are a little sceptical as to the anticipated results. Who that remembers the great fuss made some years ago at Mr. Brooke Mockett's wonderful Mysore hybrids, and the manner in which their expectations were negatived by results, will have the courage to expect anything very different from the Wynaad hybrid?

Despite our remarks, we hope there will be a brisk demand for the seed, and that the practical value of this latest hybrid will be thoroughly tested.

Male coffee. With reference to our paragraph last week on "male" coffee trees, we have been assured by a planter of great experience that, though the name may be botanically inaccurate, there is certainly a very distinct species of coffee. The non-bearing idea is, of course, absurd, but the crop is irregular at best. There are two other points of special interest about it. One is that an extraordinarily large proportion of the crop from such trees is pea-berry. The other is its almost complete immunity from leaf-disease. The growth of the primaries is upward, approaching that of the "chick," while the leaves are long, narrow, very thick, and of an unusually dark glossy colour.

Specimens of the flowers and seeds would be very acceptable at this office.

American Bicycles. The popularity of the wheel is on the increase in India, and the popularity of American makes is growing faster than that of English. From a patriotic point of view this may appear regrettable, but modern buyers judge a thing according to its worth, and if an American bicycle pleases better than its English competitors it gets the business. The "Columbia," for instance, is a well-known wheel. It can be had now either with chain or chainless. The "Hartford" is another at a lower price. And the same makers offer a "Vedette" machine at a remarkably low figure. Messrs. Spencer and Co. are offering all these machines, and are likely to have a run on them. That buyers will also have many a good run on these machines, is a foregone conclusion.

Coffee in days of old. An old book of the Eighteenth Century states that William Keeling, who was employed in the service of the East India Company in 1607, is believed to be the first among English navigators to make any mention of coffee. He called attention to the fact that the people in the Island of Socotro, where he first met with it, "have for entertainment a thing called *Cobo*, which is a black bitter drink they make from a berry brought from Mecca; this they sup off very hot, and it is reckoned good for the head and stomach."

In the same work it is stated that a dish of strong coffee, without milk or sugar, taken frequently in the paroxysm of an asthma abates the fit, and has been known to remove the fit entirely. Certainly a simple remedy that those suffering from asthma should try.

Good Business. The tea-planter is subject to vicissitudes of climate aud exchange which do not trouble the tea-dealer. This latter business when properly organised and managed is clearly a very lucrative one, says the exchange. From the report of Messrs. Brooke, Bond and Co., we find that the net profit for the year ending last month amounted to £32,128, which, with the amount brought forward, totals £36,861. The company spent £8,623 in additional freehold warehouse premises during the year. A dividend of 15 per cent. is declared, £5,000 is carried to reserve, £10,000 is written off goodwill, and £4,170 is carried forward. Thus in six years the reserve has been built up to £32,000, and goodwill has been written down by £64,000. The share capital of the company is £150,000.—*H. & C. Mail.*

Large breaks. Mr. Phillips, Secretary of the Kangra Valley Tea Association, has expressed some interesting opinions on the subject of the bulking of tea. Incidentally he remarks:—

"The cry for large breaks is fallacious. I have had breaks of 50 chests split up for sale. The larger the breaks the more the Indian tea industry will play into the hands of the alleged 'corner' of tea buyers. Small buyers, who often give the best prices, cannot afford to buy big breaks. I have often found small lots of a few chests bring better prices than the brokers' valuations when the same tea in a full break would probably have fetched less. If the alleged 'corner' of tea buyers does exist, an excellent tactic to employ against them would be to send five chest breaks and keep them bidding till they are too hoarse to go on. Of course teas should be weighed net, but this would result in a serious loss to the wharfingers, or an excessive charge for the simple process. But the time has come when economy of production must be extended to charges other than plantation expenditure. The fight will be against any particular system, but against the vested interes engaged in getting huge profits out of stupid systems that mig have suited our grandfathers, but are not compatible with tea at per pound. The price of tea has gone down 50 per cent. and cost of handling it in London has gone up 10 per cent. in the l ten years."

Corn rubber! It is time a special fund was start to be expressly devoted to the su pression and extirpation of that most objectionable creatu the artificial-natural product-producer. An ugly word th for an ugly business. Everyone is talking rubber just no and lo and behold the following:—

"What promises to be one of the most interesting discoveries recent years is to be credited to Chicago chemists in the alleg production of rubber, of a similar substance in some respe superior to rubber, from corn oil. The value of this discovery evident, especially if, as is claimed, the rubber so produced is mu cheaper than the present product. It is said that, although process is still in an experimental stage, its success is expected, this rubber is derived from vulcanising the oil of corn, and prove particularly valuable in the manufacture of mackintosh since it is not liable to crack or degenerate with time. It is asser that it can be employed in the manufacture of bicycle tyres, as i thin, durable, and capable of withstanding much more pressure th the kinds now in use. The process was accidentally discove several months ago. It is claimed—a fair inference—that if the of corn properly treated and vulcanised will economically produc superior article to the product of the South American rubber t great changes in many departments of the rubber industry may foreseen."

Fruits to eat and those to avoid. In the June *Ladies' Home Jour* Mrs. S. T. Rorer writes of "Fru as Food and Fruits as Poison," a names the kinds allowed on her own table. These "fresh figs; dried ones, carefully cooked; guavas can without sugar; guava jelly; orange marmalade made special home receipt; dates, both raw and cooked, w almonds; persimmons; bananas cooked; and an occasio dish of prunes with the skins removed; blackberries a dewberries, slightly cooked, strained and made into flu mery. The objection to the last fruit, however," says, "is the addition of starch and sugar, which is pro to fermentation. All fruits, whether cooked or raw, sho be used without sugar. It must be remembered that sug in no way neutralises an acid; for this an alkali must used. Sugar sprinkled over an acid fruit masks the obj tionable and severe acid until it slips by the 'guardkeep the palate. Once in the stomach, however, it regains own position and grants the same to the irritating aci Fruits as foods are, then, peaches, apricots, nectarines, r mellow apples, dates, figs (fresh and dried), prunes with skins, persimmons, papaws, very ripe or cooked banan guavas without seeds (fresh or canned, without suga pineapples (grated or finely picked—never cut), mango grapes, sweet plums without skins, sugar cherries, and occasional cooked pear; Bartletts are excellent when can without sugar. The fruits which must be used most spari ly are lemons, oranges, shaddocks, currants, barberr cranberries and strawberries. This applies most empha cally to those persons who are inclined to uric acid con tions. The rheumatic and gouty should also most rigi abstain. The tender lining of the child's stomach can certainly, bear such fruits any length of time; serious res

assava cultivation.

The following paragraph appeared in the *Englishman* of the 29th June: —"The Indian Industrial Association has arranged for the elivery on an early date of a lecture on 'Cassaya Cultivaon' by Mr. N. G. Mukherji, M.A., M.R.A.C., the well-nown lecturer of the Sibpur College, Agricultural Depart-ent. Cassava is a kind of potato, not known in Bengal. grows in Assam, where it is called 'Himul Alu' which eans 'Simul Alu', the leaves of the Cassava being like ombon malabrium (Simul tree) leaves. It may interest ur readers to know that as a drought-resisting and readily-tilizable crop Cassava has no equal. Mr. Mukherji has ndertaken to illustrate the lecture with specimens from a rowing plant to a ready-made *halwa* made out of Cassava our. This will contribute not a little towards rendering he lecture specially interesting to the public."—Our esteemd contemporary, says *Indian Gardening*, has been made to ay some curious things; and we take the liberty of making ome corrections in the foregoing paragraph. In the first lace Cassava is not "a kind of potato." The plant which ields the Cassava of commerce is scientifically known s *Manihot utilissima* and also as *Fanepha manihot*. It elongs to the Natural Order *Euphorbiaceæ*. The fleshy oots of the Cassava plant yield the greatest portion of the aily food of the natives of tropical America. It was this ood that Christopher Columbus found the natives consumed nost of; so that the plant has a fairly respectable antiquity. African explorers have also found the natives of several arts of the dark continent cultivating this plant for food. Our household tapioca is made from the roots of this plant, which grows to about six feet high. Its leaves resemble hose of *Simul* tree (*Bombax malabaricum*) which yields the ilk-cotton of India. It should be stated that the flour nade from the root of this plant is extremely poisonous, ut the method by which the poison is evaporated is a edious one. We shall look forward with some interest to Mr. Mukherji's lecture on such a hackneyed subject. Anyone interested in the cultivation of the Cassava plant, and he method of making the starch from its roots, has only to urn to his "Firminger" (Fourth Edition), p. 134, where ull details are given.

The battle of the teas.

We notice that Mr. Mackenzie, the representative of the Ceylon Tea industry in the United States, suggests that an effort should be made to capture the green tea trade from the Japanese. In a letter on this subject he writes:—"We must not forget that, as in England and Australia, so in America, there are only a few million pounds more of the China black tea to be displaced. Against such tea our progress has been comparatively easy. But the vast bulk of the tea used in America is green or unfermented tea. To convert Americans from unfermented to fermented tea would be a long and costly process. The present generation of planters would pay the piper without seeing much of the benefit. Whether or not Ceylon men care to make the tea the American's drink is for them to say. I can but repeat what I previously said, that a few million pounds taken off the London market would greatly relieve the tension there." This tension in the London market has to be relieved somehow, and that fact must be recognised. It is not always pleasant to have to look facts squarely in the face, but the necessity for straining every nerve in the direction of finding new outlets for tea is paramount. A go-as-you-please policy will not do. Every opportunity must be taken advantage of, and every possible encouragement offered to those who have the work in hand. That there is work to be done is certain. Here is a case of a new market for tea being thrust upon us. According to the Consular report on Sicily, just issued by the Foreign Office, a taste for tea is increasing among the upper classes in Palermo, and with a little judicious education the demand would rapidly grow. At present tea can be obtained at only one or two places, and that of a very inferior quality, while the price is very high, being about 8 lire, or 6s. per lb. The duty on tea is about 1s. per lb. if in bulk, and the cases are included in this rate. Taking everything into consideration, the Consul is of opinion that high-class Ceylon and Indian teas could be sold at a fair profit at from 3 lire 50c. to 4 lire 50c. per lb. During the past year the total amount of the commodity imported was, according to the Customs returns, only 1,000 lb. so that Palermo, and, in fact, the whole island, is yearning for more tea.—*H. & C. Mail.*

How to make good coffee.

There is nothing in the grocers' stock that has had so many imitations as coffee; yet not one of them has succeeded in either imitating or driving it out of the market. All of them have shown that it is impossible to imitate it.

When a man comes out of his room and enters the breakfast-room in the morning, and inhales the aroma of good coffee as it fills the whole house, acting as an appetizer, and dispelling his regrets at being tumbled out of bed so early to catch a train, to get to his business, he realizes that a cup of good coffee is one of the best tonics he can have, pleasing his palate, soothing his nerves, and putting him in humour to leave the house in a pleasant manner, helping him to meet his business cares without worrying. Yet all of these blessings depend, says a writer in *The American Grocer*, first, on how the coffee is made, and, second, on the kind of coffee you have been used to drinking. One may be used to drinking Java and Mocha, another Maracaibo, another Rio or Santos, and another coffee with a little chicory in it. Using either kind, it depends on how the coffee is made whether it is good or not. In order to have it made right, the greatest care must be exercised in keeping the coffee-pot clean; to see that the grounds of the previous draw are cleaned out of the spout, where some of the grounds will be sure to stick unless great care is taken—especially when egg is used to clear the coffee. The water should always be measured in the coffee-pot; the coffee weighed, always the same weight for the same number of people. I have been experimenting with kinds of coffee-pots for years, and have obtained results from the old-fashioned one. My recipe coffee is: Weigh or measure your coffee, a water, keeping the quantity nearly as put the ground coffee in a bowl, b put it in the bowl (shell and all), if necessary, to make a paste; b coffee in the pot on the range, give the pot aside for a minute or two

T
Th of
pac Mr.
being one

using unsweetened condensed milk, boiled milk or cream. In this way, using good coffee, you will get a drink fit for the gods. If there is any coffee left over, and you want to use it cold, pour it into an earthen or glass vessel; it will keep better, and not get black or bitter.

The Home Market.

Coffee.—At the Dutch sale on Tuesday, there was a fair demand, says the *P. M. Review*, and the prices showed an irregular advance of from 1 to 2½ cents above the previous sale. In this market there has again been rather a dull tone owing to the very heavy supplies which importers continue to press forward, and in consequence a larger proportion than usual has been withdrawn. Where sales were effected very good prices were in most cases obtained, particularly for home trade descriptions. From recent advices it appears that only a small further quantity of fine Costa Rica can be expected, so that when the present supplies have all been brought to auction, an improvement in prices for this sort may certainly be expected. In the terminal market a fall in the Brazilian exchange and some increase in the daily receipts has produced a dull tone, and quotations have slightly given way, but in no instance more than 1*s.* per cwt.

Indian Teas.—The demand has not shown much improvement, and with few exceptions values remain unchanged. For the small proportion of fine tea, however, there has been a brisk inquiry at firmer rates, and unless the new tea coming forward shows better quality than those already offered, the supply of fine tea is likely to be more than usually scarce. The descriptions worth from 10*d.* to 1*s.* are in very small compass, the bulk being in second hands, consequently those brought forward on importers' account were freely bid for at rather higher rates. As the new arrivals will probably consist of a fair proportion of these kinds there is not likely to be a further advance, although current rates may be maintained for the next few weeks. The medium and common sorts are in good supply and obtainable at late rates, and, judging from the result of sales recently held in Calcutta, the early imports are likely to increase the stock of these grades and the present easy values may be expected to continue. Telegrams from Calcutta report that 6,000 packages were sold there on the a 10th instant: Pekoe Souchongs were easier, and there will be 7,000 packages brought forward on the 17th instant. from e quantity brought forward here on Monday was 9,895 kages, including 1,509 packages new season's, there good competition for all the finer teas at firm rates.

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U.P.A.S.I.

THE Annual Meeting will open at the Cubbon Ro Bangalore, at 2 P.M., on 8th August, 1898. A Comm meeting will be held in the morning, and the Planters' Di will be partaken of at the United Service Club the evening. Any gentleman who desires to subscribe to dinner should address Mr. J. S. Hay, at the Club, as gentleman has kindly undertaken to make all neces arrangements.

The following is the revised preliminary Agenda p for the meeting:—

1. Secretary's Report and Accounts.
2. Confirmation of 1897 Proceedings.
3. Election of Office Bearers.
4. Committee of Enquiry.
5. Currency.
6. Agricultural Matters.
   - i. Lady-birds.
   - ii. Export Duty on Bones.
   - iii. Agricultural Chemist.
   - iv. Leaf Disease.
   - v. Adulteration of Manures.
   - vi. Government Purchases of Cinchona.
   - vii. Import duty on Chemical Fertilizers.
   - viii. Crop Estimates.
7. Registration of the U.P.A.S.I.
8. Finances (including promises of subscriptions for 1898-9
9. Encashment of Currency Notes at Treasuries.
10. Classification of Coffee.
11. The Madras Forest Act, Section 56.

Mr. G. L. Acworth is hard at work in connection the Currency Committee, and has enlisted the service Messrs. Robt. H. Elliott (Mysore) and Thos. North Chr (Ceylon) as vigorous allies. The Committee has, unfo nately, decided that only two planters shall be examine representatives of Southern India and one as spokes for Ceylon, so the Hon. Mr. H. P. Hodgson will no examined, nor will any of the other South Indian plan whose names were recently put before Mr. Acworth. gentleman and Mr. Elliott will have to do the whole w but no doubt they have already received some valu hints from others. Mr. Acworth expected to be "in box" about Tuesday last.

Valuable evidence is also likely to be given by Cap Marriott, of Simla, whose views are understood to b accord with those of the U.P.A.S.I. The Lor Chamber of Commerce was invited to co-operate with Acworth, but declined to "take sides." It issued a no however, informing members that the Chamber would happy to submit to the Currency Committee the nam any gentleman who wished to give evidence.

As regards Lady-birds, inquiries are being made wit view to discovering if there is any likelihood that supp will be obtainable from Ceylon. It is possible that if Ce importations have better success than those of the U.P S.I., the latter may be able to arrange for experime supplies from the former.

The following is Mr. Howard O. Newport's official report the

LADY-BIRD IMPORTATION SCHEME:—

n accordance with instructions received from the Secretary he U.P.A.S.I. in his letter of 28th December, 1897, and subuent letters, I left India on the 30th of January, 1898.

Before leaving, however, I had to proceed to Madras, and ile there received through the Secretary, the Chairman's egram of the 19th January, 1898, and also the authority of, l letters of introduction from, the Madras Government. I Ceylon in the O.S.N.C. vessel *Oruba*, on the 31st January, l arrived in Sydney on the 19th of February.

I was delayed a few days in Sydney and eventually proceeded rland to Brisbane, where I arrived on the 26th February.

The 27th being Sunday, I called at the Secretariat and preted my credentials on the 28th February. I was referred to Agricultural Department, where the Minister for Agriculture once introduced me to Mr. Henry Tryon, the Government tomologist. In my first interview with Mr. Tryon he said he s glad that I had come out then, and that lady-birds were ntiful. I could, he said, get two good months' work in before e winter set in, and perhaps more. As it happened, the winter gan so mildly, that I was enabled to do most of my collecting ring the latter part of April and during May.

Mr. Tryon suggested my going round to various places to ich he directed me, and collecting all and any lady-birds I nd, studying their habits as well as I could and bringing all e specimens I could get to him for identification and comment. is I did, and he pointed out to me the varieties I should lect, and showed me how to identify them. In the same way told me how to identify the bad varieties which I should avoid. this way I visited various localities that Mr. Tryon told me noting where the different varieties were to be found, and udying their habits.

Having done what I could in this way, and made a small llection of some of the commoner lady-birds, which I mounted, d Mr. Tryon named for me, I set to work under his directions get an ice-chest.

I must state here that Mr. Tryon said he had no practical exrience of this part of the business, but would give me what vice he could and work upon notes he had of other missions at had come to the Colony with the same object. I bought an e-chest, therefore, and noted and recorded the temperatures ry carefully. By putting ice into the upper ice compartment ly I found I could only get and keep a temperature varying om 50° to 55°F. But on Mr. Tryon's suggestion, I put ice to the lower compartment also, leaving sufficient room above e ice for some cases of lady-birds. The small compartment I pt dry by a layer of thick felt over the ice and under the ladyrd boxes.

All this took some time to obtain, arrange, test and regulate. nce set going I began the collecting in quantity. I obtained me hundreds of various kinds of lady-birds, chiefly *Cryptomus* and *Rhizobius*, and put them into the ice-chest and atched them carefully. I found, however, that my temperature, though varying between 40° and 45° F., was not enough to spend animation in the lady-birds. I found that the ladyrds, although very sluggish, still crawled about, and once when box accidentally opened, crawled right out on to the felt packg put around them. The thermometer which was laid on top the boxes within the felt covering was then registering 41° 43° F. The lady-birds in a few days died in this temperature found, and I had therefore to set to work and find some ethod by which I could keep a considerably lower and yet even mperature.

About this time it occurred to me that I might get some hints I were to go over the Government Cold Storage works at the ailway Depôt, so I obtained passes through the Agricultural Office and went through them. While there, quite incidentially in the course of conversation with the Government Refrigerating Engineer, I discovered that he had had some practical experience in the very line in which I was seeking information. He had, it seems, received from up-country, while in the employ of the New South Wales Government, some lady-birds and had stored them for some time and finally despatched them to California. He endorsed what I had already found out for myself, that a temperature of 40°F. was not quite sufficient to suspend animation. He said that he had found the lady-birds at this temperature retained just sufficient animation to crawl slowly about and wear themselves out, dying before their time of incarceration was over. He had, he said, frozen several batches of insects right down to Zero and kept them there, and that these had thawed out very well, producing 85 per cent. or so of live insects on being opened out in California.

This I, of course, reported to Mr. Tryon, and he advised, since it was reliable information and the best we could obtain, that we should act upon it. I called upon the Engineer again, therefore, and putting before him all the difficulties I had experienced with my ice-chest, asked his advice.

He very kindly drew for me a sketch of a brine-chest that would keep a fairly even temperature of about 15° to 25° F., which could be regulated, and would yet be portable, properly insulated and containing a dry chamber in which there would be no fear of the cases of insects getting damp. On his advice I took the plans of this chest to several firms and asked for estimates. They went into the details carefully. The chest was to be roughly 3 ft. by 2 ft. by 2 ft. outside measurement, it was to be made of $\frac{3}{4}$ or 1 in. well-seasoned, odourless pine. The outer shell properly screwed together and braced at corners, painted and with handles. Inner shells to consist of two zinc tanks, one inside the other and connected at the top only, with one and-a-half inch space between at sides, ends and bottom, and the two shells to be stayed with wire stays to prevent bulging of the flat surface. The inside (which would form the dry, cold chamber) to be 2 ft. by 1 ft. by 1 ft. 3 in. in measurement.

The tank to be stayed from the outside to the outer shell, and the 3 in. space all round between the outer zinc shell and wooden shell to be filled in with cow hair packing as insulation.

A filling and draining pipe to be fitted to the tank in the jacket space between the tank and outer shell (that is through the packing). The inlet pipe to deliver at the *bottom* of the tank and the outlet to flow from the *top*. The pipes to be of $\frac{3}{8}$ inch compo. That portion of the top that covered hair insulation and jacket, to be fixed with screws.

A movable lid, to be fitted on top and insulated, to be held in position by six brass butterfly thumb-screws. A perforated tube extending from top to bottom of inner chamber to be fixed into it, to hold thermometer in position, with a hole in the lid with plug to allow of extraction without opening case.

The lowest estimate that I could obtain in the City for the manufacture of this case was £9. I reported this to Mr. Tryon, and discussing the matter with him, he said he thought I might be able to get the chest made in the workshop of the Agricultural Department Office at cost price.

The same evening he posted to me the following letter:—

DEPT. OF AGRI., BRISBANE,
21*st April*, 1898.

HOWARD NEWPORT, ESQ.,
Bank St., Upper Melb. St.,
S. E.

DEAR SIR,

The carpenter Skinner after going into the question of cost of your new ice-chest according to the specification of Mr. Napier has intimated to me that he will manufacture one

according to the specification furnished for £3-10-0, *you to find the hair felt.*

Deeming his tender reasonable, I accepted the same on your behalf and commissioned him to proceed with the work with all despatch and it is already commenced. That there might, however, be no delay I arranged with the Under Secretary that the "job" in which he was previously engaged should be temporarily put on one side. I will intimate later when the box is perfected.

It will require about 5 ft. 6 in. cubic of felt.

Yours faithfully,
(Signed) HENRY TRYON,
Entomologist.

This took a few days to complete, meanwhile I had to obtain and deliver the hair felting, thermometers, &c., &c.

As soon as I obtained the brine-chest, I proceeded with it to the Government Cold Storage Works, where Mr. Napier, the Engineer, examined and tested the case and passed a stream of brine through it at a very low temperature, returning me the chest in working order. This chest, he thought, would keep a temperature of about 15° to 20° F.

While in communication with this department I asked if they could supply me free of cost with hair felt sufficient for the packing of my chest, and with ice subsequently. I was informed that no hair felt was obtainable in Brisbane, and that the transport of the ice would cost me more than the purchase of the ice from local ice-works, where it was delivered free of charge.

While the Refrigerating Engineer was testing my case he told me I should need a barrel, taps, India-rubber piping, etc., etc., which I obtained and had in readiness. And as soon as I got the brine-chest back to my rooms in South Brisbane I proceeded to set up the barrel and taps and to connect it with the inlet tube in the chest, connecting a rubber pipe with the outlet tube. The arranging of the barrel entailed some little carpentry work, and as work of that nature took time and was expensive, I invested in some tools and did it myself.

In the barrel I mixed, according to Mr. Napier's directions, ice and salt in the proportion of three parts ice to one of coarse butcher's salt. This formed brine and flowed through into the brine-chest at a temperature of from 8° to 10° F. I found flowing out at about 30° to 35° F., the thermometer in the interior of the chest varying between 15° and 25° F.

As I had to keep a constant flow through the brine-chest it needed constant attention, and I found some difficulty in making arrangements for the chopping up of the blocks of ice every 24 hours, and recording of temperatures, etc., while I was away from head-quarters collecting.

This was not finished and in working order till the beginning of May. Meanwhile I had been obtaining, and testing apparatus, collecting and mounting specimens for identification by Mr. Tryon, finding where the different varieties of lady-birds were to be found, and studying as best I could, their habits, going round under Mr. Tryon's directions to various Orangeries and places in the suburbs of Brisbane among them Milton Ennoggera, Grovely, the Albert and Musgrave Parks, the Botanical Gardens, New Farm, etc., etc. For the week or so previous to the completion of the brine-chest I went up by rail on a free pass to Gatton, and from there rode out some 8 or 10 miles to some orangeries, collecting in bulk. The insects I brought down I put into the ice-chest at once at a temperature of 40° to 45° F., and as soon as possible removed to the brine-chest at the lower temperature.

On the 18th of March I received the following letter from Tryon, together with some apparatus:—

MR. HOWARD NEWPORT,
Bank Street, S. Brisbane.

DEAR SIR,

Herewith I send you four glasses suitable for retaining li specimens of *Coccinellidæ* whilst under observation.

The larger ones I have had placed in a convenient box handling and transport.

Apologising for not forwarding them sooner, a circumst only occasioned by press of official work.

I am, yours faithfully,
(Signed) HENRY TRYON,
Entomologi

(The letter contained a sketch of a collecting bottle sho the quill inserted in the cork.)

For collecting the lady-birds I had a stick some 3 fe inches in length. This was divided into two parts lengthw the parts being fastened together with a screw in the mi on which they worked as on a pivot. There were brass fer on each end, and when not in use the ferrules kept the parts together—the stick then looking like an ordinary wal stick, and being easy of transport. When in use the fer were moved and the two parts of the stick moved round or centre pivot, till they were at right angles—then a st piece of canvass, with pockets at three corners into which ends of the stick were inserted and with a tape at the fo corner, was put on and tied tightly by means of the tape. formed a light tray or collecting umbrella into which I s the lady-birds, and from which I picked them up into the lecting bottles.

With this in my left hand I struck sharply the branch o tree or shrub on which I expected to find lady-birds, w light cane in my right hand, in such a manner as to catch lady-birds as they fell in the umbrella.

The lady-birds, as do several other varieties of *Coleop* on being frightened by the jar, simulated death and w lying in this state on the canvas tray, I took them up in quill, that I had previously inserted through the cork small bottle which I carried in my pocket, and avoiding to ing them with my fingers shook them down into the collec bottle. The quill projected some little distance into the bo and though the insects climbed up to the cork they seldom into the quill or out of the bottle. Some thin paper cut narrow strips and curled up having been put into the b first for the insects to cling to, I was enabled to colle hundred or so at a time in these bottles bofore transfer them to the larger glass jars where I kept them till I c place them on to ice.

The glass jars were about seven inches high by four or and-a-half inches across with open tops. Over the top I some light muslin, and before putting the lady-birds into t from the collecting bottles I picked and placed in the jars s scale covered leaves to supply them with food until I could back to head-quarters.

On arrival at my rooms I then proceeded to put the l birds, usually in batches of 500 or so, upon dry moss into s odourless pine boxes with an inside measurement of 4 in. c These boxes I had to have specially made for me; they we ¼ inch pine and pegged together, the use of nails or being unadvisable on account of possible odour or rust w might have killed the insects. The moving of the insects rather a difficult operation, as some of them, especially

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

maller ones, *Rhizobius ventralis*, were very lively. I managed his with the aid of mosquito curtains, however, and taking up he insects on a small piece of paper, or more frequently on a iff piece of green leaf, counted them into the boxes. From ne time of putting into the brine chest the boxes of insects ere not touched until I opened them out in India, as it would ave been dangerous to do so. Some of the batches I brought were dated as early as the 11th and 15th of April, the later atches being dated 21st of May. Some of both dates were pened up on the 20th June on the Lower Pulneys when, as I ave already reported, I could unfortunately not detect any gns of life in them.

In collecting I found that the lady-birds were very sluggish nd quiet in the early mornings—on early and cold mornings ey were scarce, apparently getting away on to the stems and vigs in the thicker parts of the bushes. Later in the day ey became more lively, and as the sun grew hot they became xceedingly so, and were very difficult to catch, often flying off y umbrella before I had time to bottle them.

The *Rhizobius ventralis* I found rather rare, and I was not ble to get as many of these as of the other varieties. They ere, however, to be found almost everywhere in small quantities. *ryptolæmus montrouzerii* I collected chiefly from the Albert ark in Brisbane, and *Orcus Astralasia* from several orangeries and near Gatton—some 60 miles west of Brisbane.

The latter species I found were exceedingly difficult to get in e early morning. They seemed to get away to the tops and to the centres of the thicker, and presumably warmer trees. rom about 9 o'clock till 4 or 5 o'clock in the afternoon, how-er, they are fairly plentiful on certain orangeries. The *Orcus ustralasia*. Mr. Tryon advised me to bring out, and I had hopes great things from them. They seemed much the hardier of e three varieties and thawed out better (in a larger percent-ge) than either of the others when I opened out a few from me of the earlier cases, experimentally, before leaving Australia. Being much the larger also they would probably have indivi-ually done more execution among our Lecanium.

The *Orcus Australasia* is a lady-bird some $\frac{3}{16}$ of an inch so across, almost round, and black with three red spots on ch wing case. It is smooth and shiny, while the other two rieties are hairy.

The *Cryptolæmus montrouzerti* is much smaller than the Orcus d much longer than it is broad. Its wing-cases are black and stinctly hairy, but the thorax is of a dull orange yellow.

Rhizobius ventralis was much the smaller of the three varie-es being only about half the size of *C. montrouzerii*. It is ite black on top and very hairy, though often the hairs are ly visible under a magnifying glass. The under side is black so, with the exception of the lower part of the abdomen and nt which is of a dull red color.

Scientific descriptions of the insects would be somewhat long d would not interest, I think, even if I could give them. I ve, however, some mounted specimens with me for those who uld care to see them.

Towards the end of May I discussed with Mr. Tryon the ad-sability of my taking my passage back. The ice and brine ests had given me a great deal of trouble, and had consider-ly curtailed my time for collecting. I had, however, by then thered some

2,540 odd *Orcus Australasia*,
1,500 „ *Cryptolæmus montrouzerii*,
246 „ *Rhizobius ventralis*, and a few others,—

all some 4,300 odd insects. My staying in Australia would ve cost the Fund more money, and as I was anxious to avoid penditure as much as possible, and as Mr. Tryon said that ough I stayed and collected more insect for another fortnight would endanger the lives of those I had, he advised my ing back then. This was settled on the 21st of May. The 22nd was Sunday, and the 24th being a public holiday, I had, to make all my arrangements for ice supply, transport of chests, packing, &c., &c., on the 23rd, and on the 25th May I left Brisbane for Sydney by boat.

Before leaving I called upon Mr. Tryon, Mr. Chataway, the Minister for Agriculture, and the Premier of Queensland, thanking them severally for assistance rendered and kind attention shown.

The Premier was especially courteous, and expressed great interest in our scheme, offering any assistance in his power and very kindly granting me free passes over the Railways which greatly facilitated my movements.

I would specially make mention of Mr. Tryon's unvarying courtesy, and untiring interest, also of the time he placed at our disposal, often when almost overwhelmed with official duties. His valuable advice and his great knowledge, of which he gave us full benefit, deserve our best thanks.

The brine-chest was working all right when I left Brisbane, and I put it on board the S.S. *Leura* with a temperature of 25° F. The Company very kindly allowed me to take it across to Sydney lashed up on deck. I was thus enabled, although the weather was bad, to chop up my ice, mix it with the salt in the barrel, keep the flow of cold brine uniform, and watch my temperatures.

We arrived at Sydney 12 hours overdue the next evening. The chest was working all right, but it was too late for me to move it that evening, so I obtained permission to leave it on board for the night. The next morning I went on board the O.S.N.C. S.S. *Oroya* and presented my letter of introduction from the Queensland Government to Captain McWatt, explaining to him my mission. He was very courteous, but said that he could not possibly make any arrangements by which I could keep the chest anywhere on deck. He, however, asked me if I could not put the insects from the chest into the ship's refrigerator, where, as they would take up little room, he would allow them to remain till we arrived at Colombo.

I saw the Refrigerator Engineer, and as he assured me that they would be kept dry and at any temerature I cared to keep them at, I decided in favour of the ship's refrigerator, rather than forfeiting my passage and endangering the lives of the insects by any delay.

I took out the cases, therefore, and saw them put myself into the refrigerator, in a place where they would get a fairly steady temperature of from 0° to 15° F., and where they would be kept dry. I did not see the cases again until we reached Ceylon, and they were not touched, I understand, by anybody on board. The day before we reached Colombo I got my brine chest up out of the hold and filled it with brine, and as soon as we came into port I went on shore and interviewed the Agents of the B.I.S.N. Company and booked through to Dindigul. The Agent gave me a letter of introduction to Captain Coope of the *Katoria*, who very kindly allowed me to lash my chest up on deck. I then went back to the *Oroya* and transferred my insects from the refrigerator back to my brine chest and took it across to the *Katoria* direct without going ashore. On taking the cases out from the ship's refrigerator, I was much surprised and disappointed to find that the parcel was coated with a film of ice. The only way that I can account for this is that, seeing it was put rather high up in the chamber, when the door was opened, hot air must have got in and the moisture it contained frozen around the cases. This could not be helped, however, nor could I open the cases there to see if the insects were alive. Had I done so, I should have had to keep them alive and feed them from then until I reached the estate, which was impossible. Nor could I have frozen them again without endangering the success of the experiment. I came on, therefore, without delay doing the best I could.

At Tuticorin the brine-chest was lowered into the launch by

means of a derrick and taken to the hotel. *Katoria* I found did not make ice on board, I had therefore, to make arrangements in Colombo, and I brought away 2 cwt. from there. I also telegraphed from there to India for a supply to await me. In this I was disappointed, but fortunately had enough left of the 2 cwt. to carry me to Dindigul, where a case of 2 cwt. more ice was sent up to me by the Secretary, U. P. A.

For two days in Dindigul I was getting tin cases in which to take half of the consignment up to the hills. These being completed, I started off with them. The large brine-chest would have been too heavy to get up the ghâut. The road is so bad and narrow that I do not think I could have got it up at all. I therefore had a small tin lined box made in which I put ice and salt, and in this placed the insects in another tin case. This worked very well, and the temperature on arrival, at the Pillavaly Estate was 25° F.

Within an hour or so of my arrival there on the 20th of June, I opened out five of the cases containing some 2,500 of the lady-birds of all three varieties. These I opened out on a cloth on the coffee trees, some in the sunlight, and some in the shade. Of the first five cases, two I found had got damp, the others seemed dry. The lady-birds, when I turned them out, were mostly clinging to the moss which I had put in the boxes, and they looked healthy enough, only one or two here and there looked seedy.

Most of them were full bodied and soft; their legs and antennæ I could move freely with a needle, and those that I squeezed were full and moist inside. I could, I regret to say, however, get them to show no signs of life. I watched them carefully under a magnifying glass, and tried all I could think of. I allowed some to thaw slowly, and some in direct sunlight. I got hot cloths and put them into that. I tried artificial dry heat and moist heat, I tried softly steaming them, but without any success.

I left them out in the sun, but they only dried and were very evidently dead.

Had the first half consignment turned out well, I had intended taking the second half to the Nilgiris, but since I had no success with the first I took the second lot also up to the Pulneys, and did what I could with them. As I have already reported, I had no better success with the second half than I had with the first half consignment.

Of the latter four cases two, I found, were damp. The others seemed all right, and I cannot account for the want of success in thawing them out here in India. Whether the harm was done in transferring them from my chest to the ship's refrigerator, and back again; whether in the somewhat troublesome voyage after that; whether because the temperatures unavoidably varied latterly—especially during the Railway journey; or whether it was that the whole journey was too long for them I cannot tell. The time that elapsed between my putting into ice the last batch of insects and my opening them out was thirty days *i.e.*; from the 21st of May to 20th June.

Subsequent Consignments.—On the 16th of May I approached Mr. Tryon in Brisbane on the subject of subsequent consignments, and read to him the para. of the U. P. A. Secretary's letter to Mr. Gerrard, Hon. Sec., L. P. P.A., dated 5th Feb. 1898, (copy of which Mr. Gerrard sent to me) in which he said "it may not be necessary, I hope, to appoint an agent in Queensland, but that arrangements may be made with the Department of Agriculture to assist in regard to future consignments at actual cost." I told Mr. Tryon exactly what it was we should need, and he said in reply that he thought it could be arranged. He suggested that if we addressed him through the Dept. of Agriculture he might be able to get it done. He could not, of course, collect himself, but he could get others to collect the insects for him. If he could choose the right time of year and season he could get large consignments of either *Cryptolœmus montrouzerii* or *Orcus Australasia*, as he knew exactly where to send them and how to have them collected.

He thought a £5 note would cover actual cost of collect and keeping in Brisbane some 3 or 4,000 insects, perh more. He could not tell what expenses might be on the voy but did not think they would amount to much. He could of course, send any one in charge of consignments, consequer they would have to be left in charge of some ship's officer put into a refrigerator. He could have them put safely board, but could not of course, guarantee safety on the jour The chief difficulties would be in receiving them in Ceylon bringing on to India, but these would not be insurmounta At any rate he invited correspondence. In view of this r from Mr. Tryon I did not endeavour to make any other arra ments.

Personally, I do not think a consignment would cost n than £10 or so, and we could, if Mr. Tryon thought advis or necessary, send out to him the brine-chest and any othe the apparatus that we now have, to be used in the despatc future consignments.

Accounts.—I am submitting accounts herewith. These s a total expenditure of Rs.4,243-8-0 : one or two other it of expenditure that will show in the U. P. A. Secreta accounts, but which still come under this heading do nc believe, amount to more than some Rs.150 or so. Givi total expenditure for the scheme, so far, of some Rs.4,400.

If, as I understand, the sum of Rs.7,535 now stand the credit of the Fund in the U.P.A.S.I. accounts, should leave a credit balance of over Rs.3,000, which w allow of the importation of a good many consignments at each.

The ice-chest, mentioned earlier in my report, which I chased at first and used for temporarily storing my consign as I got them in, before I put them into the brine-chest, I f I could not bring to India. Having no further use for it ei Mr. Tryon suggested my leaving it in Australia to be sold did so, but since it was then the beginning of Winter a should have got a very small price for it, I left it to be later on during the Spring, when it would fetch very much m This is, of course, the property of the U.P.A.S.I. It will p bly be sold in a month or two from now, and when sold money will be remitted to me, and by me to the Secre U. P. A.

The chest cost originally £4-5-0, and would sell in Spring or beginning of Summer for some £3 or £3- I should think, as it had not been much used and was in order.

Government Order.—(Madras) No. 2294, of 26th May, and correspondence attached. A copy of this Government O with enclosures, was sent to me by the Secretary, U.P.A., after my return.

It is a pity we could not have had Professor Blandf opinion and observations before the experiment was pu hand. This is one of those occasions, however, in which, bably the experiment has called forth the opinion. Prof Blandford seems, either while knowing our scheme in fu have disallowed any possibility of success, or not to have all the facts of the scheme (with regard to the importati lady-birds dormant on ice) before him.

Our scheme as it stood, however improbable of success it have been, at any rate did away, almost entirely, with possibility of the introduction either of Indian scale pests Australia, or of new scale pests on to coffee in India. Prof Blandford was perfectly correct in his deductions that I not an Entomologist, and secondly that our scale pest in is *Lecaniun varide*, but he seems to have been unaware o fact that the U.P.A.S.I., in deciding to send over a plante lack of an Entomologist, was not trusting to the unsk

efforts of a non-entomologist to collect, identify or choose suitable *Coccinellidæ*, but sent him, with due introduction from Government, to an accepted expert, Mr. Henry Tryon, of Queensland, to act under his instructions, on his advice and with his approval, thus insuring, as far as possible, the importation of only the useful and good varieties of *Coccinellidæ* into India.

The first consignment has not thawed out successfully, however, and now that we know where to go to obtain it, I trust that the U. P. A. will have the further benefit of Professor Blandford's opinion and advice.

In conclusion I would remark that the first consignment sent over from Australia to the Sandwich Islands failed, I am given to understand, in much the same way, and that the planters there did not let the matter drop, and that subsequent consignments not only thawed out well, but did exceedingly satisfactory work, as we all know.

Unless we have advice directly to the contrary, from some such expert source as Professor Blandford, I trust that the U.P.A.S.I. will also not allow the matter to drop, but import further consignments to be experimented with, from the balance of the fund that is still in hand.

HOWARD NEWPORT.

YERCAUD,
4th July, 1898.

A CO-OPERATIVE SALTPETRE REFINERY.

(*Contributed*).

YOUR issue of 9th instant contains the following note:—"It has always struck us as very curious that South Indian Planters, with their fondness for expensive English chemical manures, should not have used the crude Indian saltpetre more than they have. * * * * The true saltpetre is nitrate of potash, and contains a large percentage of nitrogen. It is very cheap, about 80 rupees or so per ton, compared with the expensive nitrate of soda."

This note opens a large subject, in which I take great interest, and I should much like to know exactly what produce you refer to when you speak of "crude Indian saltpetre." If you use the term in its general and official acceptation, *crude* Indian saltpetre is not available to planters. A deal of confusion exists in regard to Indian saltpetre, and the term "*crude*" is often employed in a very loose way. Some little time back a brother planter told me he was using, or going to use (I forget which) "crude saltpetre" as a manure; but when I asked him what he meant by "crude," he could not tell me; and when I said he could not possibly refer to crude saltpetre of Indian manufacture, he replied "I don't know where it is made; all I know is that the agents from whom I am buying call it "crude." I will try and make the difference between crude and refined saltpetre of Indian make, clear; and you must pardon me if, in this attempt, I deal with technicalities a little.

Saltpetre manufacture in this Presidency is carried on under the *ægis* of Government, owing to the large admixture of sodium chloride that nitrous earth always contains. Two kinds of licenses are issued by Government. The first, or *A* license, is granted to the Upiliya, who collects the nitrous earth, runs it through a primitive filter, and boils the nitrous liquor. The product resulting from this preliminary process is known officially as *crude* saltpetre, and contains a large proportion of sodium chloride, with other impurities. If, when you speak of "crude Indian saltpetre, you refer to this, it is beyond the reach of planters, because the *A* licensee, or crude saltpetre manufacturer, is bound by the terms of his license to take this crude product to the *B* licensee or refiner. The sale of crude saltpetre to anyone but a refiner, is a criminal offence. The *B* licensee, who pays Rs.30 or thereabouts for his license, then educes the sodium chloride under the supervision of a Government Amin. This process—the eduction of the salt—depends on the fact that, whereas the solubility of saltpetre increases rapidly with elevation of temperature, the solubility of sodium chloride remains constant (practically) in either cold or hot water. The crude saltpetre is dissolved in water, and when a saturated solution is obtained, it is poured into an iron basin or boiler. Under this a fire is kindled, and as the menstruum decreases in volume by evaporation its capacity to hold sodium chloride in solution diminishes in a corresponding ratis: while the increase in temperature compensates for loss of volume in the case of nitrate and potash, and this is consequently retained in solution. As the sodium chloride is precipitated, it is scraped from bottom of the boiler, stored in a locked godown, of which the Amin is in charge, and periodically weighed and destroyed. After the eduction of the salt, the supernatant liquor is poured into vessels, which are usually barried till their mouths are flush with the ground. As this nitrous solution cools, the saltpetre crystallises out. The product now obtained is called *refined* saltpetre, and it is this that is available to the public. Saltpetre once refined is by no means pure, and the process I have described may be repeated again and again, each succeeding crop of crystals being purer than the last, and consequently of higher commercial value. After what I have said, I take it that you allude, in the note quoted at the beginning of this letter, to "refined" *not* to "crude" saltpetre.

Whether crude saltpetre, with its large proportion of contained salt, would be of much value as a manure for coffee, is a question. If it would, there should not be much difficulty in inducing the Revenue Board to permit its sale to *bonâ fide* planters, under a guarantee that it would be used solely for manurial purposes, and that no attempt would be made to educe the contained salt. But the ways of the little tin gods are sometimes curiously perverse, and it must not be taken for granted that such permission could be obtained.

As to the value of refined saltpetre, *i.e.*, the saltpetre of commerce, as a manure, for coffee, there is, of course, not the shadow of a doubt, especially when—as you point out—used in conjunction with bones. If I am right in supposing that you refer to refined saltpetre, I would be greatly obliged if you would tell me where it can be obtained at "Rs.80 or so per ton." A year back I asked a refiner in Coimbatore to say at what rate he could supply refined saltpetre, and the price he named was Rs.290 a ton on rail at Coimbatore. At this figure it would be much more expensive than imported nitrate of soda.

But there is absolutely no reason (save apathy!) why South Indian planters should not manufacture this most valuable manure for themselves at a very small cost. I have several times been on the point of writing to you on this subject. That I have never put my intention into effect must, I am afraid, be ascribed to this same failing. But now that I am launched, I may as well carry on, and, with your permission, will give my scheme in broad

outline. It is this—that South Indian planters should combine, make advances to Upiliyas, and start their own refinery in some district, such as Coimbatore or Trichinopoly, where nitrous earth can be obtained in large quantities. I am absolutely sure that under this system, which would eliminate the middleman—the B licensee—and his enormous profits, refined saltpetre could be outturned at a *much* lower rate than the one you have named, Rs.80 a ton. I have some little knowledge of the subject, and provided a sufficient number of estates—say 25,—would each advance a sufficient sum, say Rs.50, to cover the initial expenditure, (which would be small comparatively), and would guarantee thereafter to take enough saltpetre annually to keep a refinery going, I would gladly undertake to put this scheme on its legs, without remuneration of any kind. The reduction in price of this valuable manure to about Rs.50 a ton would be a sufficient recompense for me. All I should look for would be the repayment of expenses actually incurred in travelling, &c. If a refinery, such as I contemplate could be started, all subscribers would of course obtain their saltpetre from it at actual cost price. The only expenditure other than the purchase of the crude saltpetre at a fixed rate, would be the salary of the writer in charge, say Rs.30 a month. My own subscription of Rs.50 is ready. Will the others be forthcoming? I know of a large building, created many years ago as a saltpetre refinery in Trichinopoly district, which could probably be had for the asking. Even if it were necessary to build a refinery, the cost would be very small; for all that would be required would be a mud hut with thatched roof, and the mud wall all round that the authorities require. I will be glad to hear from anyone interested in the subject, and I have no doubt, Mr. Editor, you will be kind enough to forward all letters that may reach you addressed to "Toda," to your care. Fifty rupees can scarcely be deemed a large outlay for an estate, if the price of saltpetre can be reduced to about 50 rupees a ton. If a larger number of estates than I have contemplated should join, the subscription could probably be reduced. Should this suggestion meet with sufficient response, I will put my scheme into force at once, and I may add that personally I will spare no trouble to make it a success. There are many minor details which will have to be gone into; but of course the scheme need not be elaborated until and unless I find the necessary number of depreciated (or should I say appreciated?) dibs are forthcoming.

TODA.

DEEP CULTIVATION.

IT will not be unprofitable to consider whether deep cultivation and the bringing of the subsoil to the surface is injurious to coffee, especially as the query has been put by "K. D. H." in *Planting Opinion* of the 11th ultimo, as to whether "it is not a mistake to spread your subsoil—probably a stiff clay—over your surface soil." He asks the question in connection with the opening and filling of plant pits, and proceeds to answer it, apparently to his own satisfaction, by saying: "A mistake in more than one sense! If 18-inch pits are required, by all means have them, but directly they have been dug, put the soil back as you found it. Subsoil where subsoil should be, and the surface soil on top. Not as many men do, scrape all the good soil into the pits and leave the infe stuff on the surface; by so doing, I have no doubt plants do very well for the first few years. But do pay in the long run?"

Now this amounts to a sweeping condemnation of a p tice that has been in vogue since coffee-planting was be One would think that anyone would be very chary a doing a thing like this till he had exhausted all the m at his command to ascertain whether the practice had support of science or not. "K. D. H." does not tro to look into the thing at all. It appears to him absur the face of it, and he condemns it straight off.

Professor Henry Tanner's definition of agricultural sci is: "Scientific truths taught by the Practice of Agri ture," and it is one which we would do well to bear in m He says: "As soon as we accept this definition of A cultural science, we are thereby guided into a safe co for obtaining sound and reliable information on the subj The laws of agricultural science will be most accura learnt when they are deduced from the practice of farm and from a careful observation of the conditions w control the production of our crops."

Let us consider whether the practice under discuss and that kindred one of making renovation pits spreading the subsoil from them over the surface, is not a mistake from a scientific point of view. We will suppose that subsoil to be a stiff clay. Well, in the place, it is put in a loose heap beside the pit. In this tion it undergoes a good deal of 'weathering' before b incorporated with the soil in the digging, which weathe renders some at least of the plant food in it, which ne all clays contain as impurities, available. When it is incorporated with the soil in the digging it gets mixed the organic matter of the soil, the effect of which i separate the particles of clay and render it lighter (Tann Moreover the weathering action does not cease, and before it is called upon to supply the needs of the grow plants, it is safe to say that it has become a valuable a tion to the soil. It would be a very good thing if, w the clay subsoil is still lying in heaps, a small quantit quicklime could be mixed with them. "Potter's cl says Liebig, "belongs to the most sterile kind of soil, and it contains within itself all the constituent elements essn to a most luxuriant growth of plants; but their mere sence is insufficient to secure this end. The soil mus accessible to the atmosphere, to its oxygen, to its carbo acid; these must penetrate it, in order to secure the co tions necessary to a happy and vigorous developmen the roots. The elements present must be brought into peculiar state of combination which will enable them enter into plants. Plastic clay is wanting in these perties, but it is imparted to it by a feeble calcination. was first observed in the process of the analysis of sev silicates of alumina (constituents of clay). Many of t are not at all acted on by acids in their natural state, become completely soluble in acid when they have b previously burned. In the natural state of clay, it may digested with concentrated sulphuric acid for hours, w out dissolving in any appreciable quantity; but when clay is slightly burned it dissolves in acids with g ease. . . . The process by which the elements of clay thus brought into a soluble state by fire correspo

o that by which they are brought into the same condition by the action of lime . . . the lime and the heat produce, respectively, such effects upon certain constituents of the clay, that the remaining constituents become soluble." (Phillips' *Principles of Agriculture*). This lengthy quotation was necessary to show some of the effects of lime on clay as well as the good that results from exposing clay to the air. Professor Tanner also says that lime has the effect of lightening clay and sometimes of starting the formation of the double silicates of alumina in the soil, a process which is of the utmost importance in the nutrition of plants. While saying, however, that mixing lime with the clay brought up to the surface in pitting on estates is perfectly feasible, it must be recognised that it is not done. But, as shown, simply exposing it to the weathering influences of the air, sun and rain, would seem sufficient to a very appreciable extent. Even supposing that the clay brought up is impregnated with ferrous oxide, a substance which is unfavourable to vegetable growth, exposure to the air will make it take the higher form of ferric oxide, which is very valuable in the promotion of vegetable growth. Professor Tanner says: "There is another oxide of iron, known as the peroxide (ferric oxide) which is exceedingly valuable in promoting vegetation. When exposed to the atmosphere it absorbs ammonia from the air, and when it is again buried in the soil it yields up its accumulations to the growing crop; and in case of necessity it also gives up a portion of its oxygen; thereupon it takes the form of the lower oxide, and if it were present in any large proportion it would then exert an unfavourable influence upon plant-life. In the ordinary course of cultivation, when the land is again ploughed, *it is brought to the surface, or within reach of the air, when it again secures its full supply of oxygen, and thereupon becomes valuable to vegetation.* (Italics mine.)

It should be the care of the planter, especially one who has only a 9-inch depth of top soil, to deepen it, and the only way in which this can be done is to put in deep drains and bring the subsoil to the surface, not too much of a sudden, but gradually. Phillips quotes the following passage from Professor Low in support of it. "Another purpose sometimes promoted by tillage, and subservient to the amendment of the soil, is the *deepening* of the upper stratum. It is important that there should be a good depth of soil; and thus it is often expedient, for the effecting of a permanent improvement of the surface, to plough up and mix with it a portion of the subsoil, even though this should previously have been infertile. By exposure to the air, and comminution of its parts by tillage, the new material turned up loses by degrees its infertility, and the whole soil becomes amended by a large space being afforded for the extension of the roots of the plants. This is a matter of long experience in the garden, where deep trenching is practised for the purpose of forming or improving a garden soil." Professor Munro, a later authority than Phillips, after considering the objections to trench-ploughing says, "Still we must not forget that to deepen the soil is beneficial, and the best way is to do it gradually. The best time to deepen a soil is before it is to be fallowed or prepared for a root crop." We can understand the objection to bringing up too much subsoil to the surface in forms, because when the subsoil is first turned up it is more or less infertile, and the crop has to *start growth in this weakened soil.* "Still it would be beneficial to do it gradually." In the case of coffee, however, the plant starts life in good surface mould, which has been scraped into the pit in which it is planted, and the subsoil is being got ready to provide it with plant food later on.

In renovation pitting, too, the subsoil is brought up after the supplies are, or ought to be, all planted out. In order to secure the greatest amount of good from this work it is well that coolies should not be allowed to trample on the ground for a couple of months after it has been done. In that time a good crop of weeds will have come up, and these might be hand-weeded and chucked into the pits, the land being immediately afterwards forked up without being turned over. A little soil might be put over the weeds to prevent the escape of ammonia. This digging will insure the thorough aeration of the subsoil, and in the next digging it might be mixed with the surface soil. In conclusion, I may say that I have never known ill-effects to follow from covering the soil with a very heavy dose of subsoil taken from depôt or manure holes 3 and 3½ feet deep; on the other hand, it has always struck me as being just the other way about.

H. G. R.

THE TEA INDUSTRY.

THE good old ship, the *Tea Industry*, was launched in 1837. Twice has she nearly foundered since that important year, once in 1846-47, when the then £50 shares of the Assam Company (£20 paid up) were hawked about the market at 2*s.* 6*d.*, and were practically unsaleable even at that figure; and the second time during the period 1866-68. Both these crises were due to mismanagement owing to the want of experience, and to reckless extravagance and speculation. She has indeed sailed through troubled waters, shipped many a sea and been buffeted by many a storm, but her timbers being sound and her crew loyal she has weathered all, and steers her course under full sail.

The beginning of the industry was small, slow and doubtful, like "the cloud as big as a man's hand." The most sanguine never imagined to what it would grow; none conceived the extent and importance it was destined to attain. What a stride from 46 boxes containing 1,748 lb. (of which 12 boxes containing in all 456 lb. were selected and sent to England), in 1837, to 240,000,000 lb. (India and Ceylon) in this year of grace 1898! The periods of depression of our industry, when it was well nigh on the verge of bankruptcy, have taught all connected with it lessons never to be forgotten. Living and learning, we have profited alike by its failures as well as by its successes. "History is philosophy teaching by example," and we have sixty years of its history for our warning, to counsel and guide us.

The tide of progress has not as yet reached its flood. It is only of late years that the enterprise has really begun to be understood in all its branches. In spite of our accumulated knowledge, we find that some of our principles and systems of cultivation, manufacture, etc., are backward and deficient. We are (we may say) as little children playing on the shore of the great ocean of knowledge. A consciousness has taken possession of us that what we know is small when compared with what we do not know. This is a hopeful sign and doubtless before many years pass over our heads, a new era will be inaugurated, and we shall see many changes in our present methods, changes which will guarantee success in place of failure.

The present is a most critical time; many things, of late, have been, and are still, working dead against us: all connected with the industry are anxiously straining their eyes to see and avoid the rocks ahead. Will the good old ship safely steer her course between her Charybdis and Scylla? We planters are no pessimists, and knowing full well how ably she is officered and how staunch and loyal is her gallant crew, have no fear as to her ultimately reaching port in safety. To ensure such a consummation, however, it is essential that her crew should be united, and that each member, from the skipper down to the youngest "A.B.," should contribute his quota to the general sum of knowledge.

Doctors differ at times, so do we planters, but differences in

opinions are often the best way to arrive at a knowledge of the truth, Moreover, "in the multitude of counsellors there is wisdom."

If we are to succeed and come out victors in the coming struggle we must work shoulder to shoulder, and combined, give "a long pull, a strong pull, and a pull altogether." United we shall stand, divided we shall fall.

When we look back on the illustrious roll of such single-hearted men as Scott, Jenkins, Veitch, Charlton, Bruce, Wallich, M'Clelland Griffith, Fortune, Royle, Hanny, Reid, Geo. Williamson, Jameson, Nassau, Leas and Peal, who have so greatly enriched our planting literature, we cannot but acknowledge that verily "there were giants in those days." Some scientists now affirm that the cultivated tea-plant is deteriorating. Surely we are not going to allow ourselves to follow suit, and run to seed? The industry, now more than ever, requires good, strong, powerful writers. To assert that such men are at present non-existent is absurd. The very reverse is really the case, but for some occult reason or reasons, we seldom see the results of their experiences, researches and observations in print.

An impression appears to prevail that all that is necessary is merely to communicate with the Indian Tea Association or the Agricultural and Horticultural Society. But the publications of those bodies do not reach the entire planting community. We sometimes also write to the dailies, but, as a rule, our discussions are out of place in a general newspaper. The advantages of a cosmopolitan class journal are that all conceivable subjects, technical or otherwise, connected with planting and agriculture generally, can be thoroughly discussed and ventilated to the mutual benefit of all.

Scientists and experts are all very well in their way: they can, undoubtedly, afford us great assistance, but the real backbone of the industry is the *practical* planter. Without his co-operation and assistance little hope can be entertained of the enterprise making much headway.

It is to be hoped that the spirit of enterprise shown by the proprietor of this journal will be duly rewarded by the *planter* being made the bond of union between all in any the least way connected with the great and rapidly-growing planting and agricultural industries in this land of Ind. It is for our benefit, and that of the whole industry as a unit, that we should liberally support its columns with our contributions. "God helps those who help themselves." It is a duty we owe to ourselves and our *alma mater*, the great Indian Tea Industry.—*The Planter.*

THE VALUE OF BONE-DUST AS A FERTILISER.

(*Communicated.*)

WE have only just seen an article in the New South Wales *Agricultural Gazette* on the above subject, referring to certain experiments, the results of which should prove of interest to planters in this colony who largely use bone-dust as a fertiliser.

In 1889 Professor Wagner of Darmstadt carried out a series of experiments which led to the surprising conclusion that the phosphoric acid in the ordinary raw bone-meal was so low in fertilising value when compared with the phosphoric acid in super-phosphate or Thomas slag as to be almost worthless. The estimated low value of bone-meal was based, it is said not only upon its immediate effects, but also on its after-effects. We need not refer at length to the details of Wagner's experiments; suffice it to say that equal quantities of bone-meal super phosphate and basic slag were used, and all other conditions were the same, but the results as regards both the immediate and after-effects of the bone-meal were so inadequate as to lead Wagner to put it down as practically worthless for its phosphoric acid. As a result of these experiments the Association of Bone-meal Manufacturers of Saxony appealed to Professor Märcker, of Halle, to investigate the question thoroughly. Märcker's experiments extended over four years (as against three of Wagner's) and embraced different kinds of crops and soils, and different brands of bone-dust (raw, steamed and degelatinised) representing the best qualities of bone-meal on the market. Professor Wagner would appear to consider that the phosphoric in raw bone-meal, is steamed and glue-free bone-meal is about equal in value.

Where equal quantities of bone-meal aed super-phosphate were used, the results of the trial for early effect were as was to be expected, very unfavourable to the bone-meal. As a result of a variation of the same experiment it was found that there is no advantage in mixing bone-dust with super-phosphate, as the increase of yie practically due only to the super-phosphate. The soils in experiments were sandy ones, which are regarded as being partic benefited by the application of bone-dust. The next seri experiments were conducted to test the fact whether bone-m really valuable for its after-effects, and, if, as it is reported to permanently enriches the land.

With small quantities of super-phosphate there were no str results in the second year, as the greater part of the ava phosphoric acid had already been used up in the first year. W a larger quantity of super-phosphate (but equal to the amou bone-meal) was used, the after-effects were considerable, and th not so good as in the first year, were, nevertheless, very much l than the after-effects of bone-meal. During the third year after-effects of bone-meal as compared with super-phosphate, found to be still less favourable.

Another series of experiments went to show that the after-e of bone-meal are not increased when used in conjunction with s phosphate. The results of the experiments above quoted w appear to warrant one conclusion, viz., that, at all events sandy soils, which are exactly the soils supposed to be benefite bone-dust, the action of the phosphoric acid in bone-dust doe approach the action of the soluble phosphoric acid in su phosphate, whether the bone-dust is used alone or with su phosphate, whether in respect to the immediate results or a effects.

The next series of experiments were undertaken on diff classes of soils, relatively rich in phosphoric acid, having been in previous years for bone-meal experiments. The soils incl sandy soils, loam, humus loam, clay loam, sandy loam, humus s etc. The results were again unfavourable to bone-meal ma These experiments, as Professor Märcker observes, would hav unwelcome result if it were not possible to treat bone-meal in a c way so as to make it more effective, and this can be done by m of a small quantity of sulphuric acid not enough to produce su phosphate but bicalcium phosphate, a form which, though insol in water, is ready available to the plant and little inferior in fer ing value to super-phosphate. This can be done by adding to e 100 lb. of raw bone-meal, 20 lb. of acid of 60° strength (Baum 40 lb. to every 100 of glue-free bone-dust. It is advisable tha bones should not be in too fine a powder, but in a coarse state a the size of peas. The proportions given are said to be the effective.

To quote Professor Märcker's own words: "One may twist turn the matter as one will, whether used with cereals or cruci in sand, clay, or loams, rich or poor in phosphoric acid, in col hot years, whether in respect to its effects upon the first or u succeeding crops, the result is always the same, namely, the ac of the phosphoric acid in bone-meal, whether raw or steamed glue-free, is invariably unsatisfactory, and the author comes to conclusion that it is high time that raw, steamed and glue-free b dusts ceased to be regarded as phosphoric fertilisers; they req previous treatment just as the mineral phosphates do, in orde make effective fertilisers of them, and the author believes that future of the bone-meal industry lies in the preparation of t products which the experiments here recorded have shown to effective."

The inference to be drawn from these experiments is that beneficial action of bone-meal—for that it is beneficial canno gainsaid—is due not to the phosphoric acid, but to the nitroge contains. Professor Märcker is reported to be—at the date of article here summarised—engaged in a series of experiments, the object of ascertaining more exactly the nature of this act As far as he has gone trials have shown that the effect of nitrogen in bone-meal is 70 to 80 per cent. of that produced by nit of soda in sandy soil, and from 55 to 70 per cent. in humus lo It is said that an independent series of experiments carried out Dr. Leichtl and Dr. Voght of the University of Bern in 1 goes to substantiate the results of Wagner and Märcker. In th trials it came out that the effects of Thomas phosphate were superior to those of raw as well as degelatinised bone-meal,

A question that suggests itself to our mind is, to what exten bone-dust affected, *i.e.*, rendered available to plants by the differ climatic conditions (temperature, rainfall, humidity of the air, e in the tropics? Again, is the gradual conversion of insoluble i soluble phosphate sufficient for the needs of perennial vegeta such as tea and cocoanuts?—*Tropical Agriculturist.*

THE WORK OF LADY-BIRDS.

Report of Prof. Albert Koebele, Entomologist of the Hawaiian Government.

Lecanium hesperidum, Linnæus, is but rarely found on the higher ltitudes; it comes from the temperate zones.

Lecanium longulum, Douglas, is one of our commonest species nd attacks most any plant on the islands. It was this species that aused the smutty appearance of the iron-wood trees in the park efore the introduction of the Rhizobius beetle. It is found in the ropics only out of doors.

Lecaniun mori, Signoret, is found also upon many plants in the slands, on various ferns, guava, etc.

Lecaniun nigrum, Nietner, the commonest of all scale insects in he islands, nearly always can be found upon the Hibiscus hedges, roton, guava, fig trees, etc. It was met with everywhere in the ropics, Fiji, New Caledonia, Queensland, Ceylon, Singapore, Hong Kong and Formosa. In Japan it cannot live out of doors, and is ound only in green houses.

Lecaniun oleæ, Bernard, is not found numerous in tropical ountries, it is rarely met with in Honolulu, only in one instance ave I seen it numerous upon oleander, on Hawaii.

Lecaniun tessellatum, Signoret, another species found here and here, but not numerous as yet, it is more often attacked by internal arasites.

Pulvinaria momeæ, Maskell, and an unnamed species in Kona, are erhaps the only well established species aside from P. psidii men- ioned above. It had first been found upon Mamea Americana, Linni, luring January 1894, but since then it was found on many trees in Hono- ulu, especially mango and fig. No parasite has been observed on he same, yet without any doubt the Cryptolæmus larvæ and those f the numerous species of Hyperaspis introduced from California nd Japan will destroy its eggs. A fourth species of Pulvinaria was ound at Honolulu upon newly introduced Potocarpus from Japan, where the insect is rather rare upon many trees, especially the amellia and magnolia.

Planchonia sp., so far but one specimen was found in Honolulu pon Jacaranda mimosifolia, Prosopis dulcis, Oleander, fig trees, etc., nd it is preyed upon by an internal Chacid parasite to such an xtent that in some instances the scale has disappeared entirely from ome trees. Found at Hong Kong, China, upon fig tree and badly arasiteized. Eryococeus araucariae, Maskell, is found on all the slands upon the various species of Araucaria; it comes from Australasia.

Of Dactylopius we have a great many species in the islands, but et they are with a few exceptions, not worked up. It is one of the ost easily species to introduce, since many of them when full rown will often leave the plant and secrete themselves most any- here to deposit their eggs, often on the roots, in any crevice or ehind leaves on stem, etc., the most minute examination of plants ould not reveal them.

Icerya purchasi, Maskell, is so far the only species present in the slands, I. Aegyptiaca, Douglas, and I. Seychellarum, Westwood, re found on many plants around Hong Kong and may be brought n at any time. The two lady-birds preying on those species in China, viz; Rodalia fumida, Muls. and R. pumila, Weise, were in- roduced and no doubt are breeding upon I. purchasi which once so umerous, can now only be found after careful search.

The above comprise the principal coccids found in the islands, ery many of them are preyed upon the internal parasites that were rought in with their host. Some of these are doing very beneficial ork, often destroying a large percentage of the scales. Only in few nstances were scale insects with internal parasites introduced by e, since there is more or less risk in doing so, it was considered he safest way to follow, only to send the numerous predations nsects found preying on the scales and here we have the numerous ady-birds, some two hundred species of which had been introduced ith more or less success. It seems that those introduced from the ropical countries, or such that are found in similar latitudes to that f the islands with a few degrees, have succeeded best to establish hemselves; especially when the same coccid upon which they fed in heir home was at hand, the increase was marvellous.

Aside from the parasites and predacions insects introduced we ave established two species of fungoids destructive to all the ecanidæ and these have since spread over most parts of the slands. A repeated trial with a third Microcera coccophylla, that lives upon the expense of the various Diaspidinæ, has as yet not been so successful. Still I am confident of also establishing this very valuable agent to eradicate the scales. It was met with in New South Wales northward to Cairns, Queensland. It is present in Ceylon, China Formosa and even as far north as southern Japan, chiefly upon the various Aspidiotus and Mitilaspis, coccids that are always abundant where they occur, owing to their hard protective covering, the enemies preying upon the same have not the equal chance as those preying upon other scales.

At the present time, the most pernicious coccids, at least, have practically become harmless and will become still more so with the increase of their various enemies. I anticipate no danger to the vastly increasing coffee culture by scale insects still present, some of these will yet cause a little trouble to the citrus trees, but I am confident to overcome the same in the near future, as has been done in the past, not with artificial means, but with natural enemies, which, when once established, are an everlasting benefit to the country where introduced.

Of the introduced Coccinellidæ I will give a short account of some of them. To my knowledge, and that of Rev. Blackburn who studied the insects on the islands some twenty years since, only three species of lady-birds were present. Those were Coccinella abdominals, say, an American insect, and no doubt introduced at a very early date, since it has been known to the oldest residents. It feeds upon Lecanidæ and Aphids, is not a fast breeder, and since the introduction of other forms has become much less in numbers. The other two are small Scymnus, S. ocellatus, Sharp, and S. vividus, Sharp, the last at least, has repeatedly been found breeding upon plant lice. Owing to the large quantities of Coccinella repanta on the islands, none of the California forms that live upon plant lice have been observed as yet, save that one visitor on the dinner table in the club on Nov. 10th, viz., Coccinella Californica, Man., intro- duced two years since, yet we are safe to say, several species will turn up in time, if properly searched for. Chilochorus bivulnerus, Muls., was brought to the islands, in 1891, on my trip to Australia and turned over to Mr. A Jaeger, who liberated the same.

Again large quantities were sent to you during Dec., 1894, with all other California forms. The insect was found breeding, both in 1894 and during the last summer, yet never numerous. This is one of the most numerous native lady-birds in California that feed upon various scale insects, and a higher altitude may be suitable for their increase. Sendings of these as all other forms will be made again to the various parts on the other islands direct. Hyperaspis were sent to you in several species, all of these feeding upon the various mealy bugs (Dactylopius), then so numerous in Honolulu. You have forwarded one of the beetles to me at Sydney, some ten months later, as breeding in Honolulu. This has been H. undulate, Say., and I personally have not met with it since, owing no doubt to the enormous increase of other forms, and in consequence the scarcity of its food.

Large numbers of Scymnus were also forwarded to you, and strange to say one of the very rarest California species, S. debilis. Lec., that had not been found again ever since being described over

Colombo.

forty years ago, was met with in quantities while collecting Rhizobius upon Casuarina. The little beetle in California breeds upon Dactylopius, and very likely on the same in the islands, D. calceolaria, Maskell, on the sugarcane would be similar to that on grass in California.

Of the Australian forms we certainly have the most beneficial of all the lady-birds introduced. Of the Aphis feeding species, Coccinella repanta, Thumb, has done wonders in destroying all the various forms of lice on trees, shrubs and plants. It appears usually first upon the orange plant louse; it has practically cleaned out the taro louse, and with it has cured the formerly so prevalent disease upon these plants, which decayed to a large extent in consequence of the myriads of plant lice present; and recently it has shown its ability upon the newly appeared louse in the cane fields at Kauai, Oahu and Maui. It has spread within one year, after being distributed by you, over all parts of the islands, and was met with both on Hawaii and Maui as high up as timber will grow. How unfortunate, that upon such beneficial friends we should find a parasite destroying the same to a large extent, yet such is the fact. Everywhere the beetles may be found, apparently at rest on the leaves, yet under it and between its legs a small yellowish silken cocoon is found, from which in due time hatches a small black hymenopterous parasite, Centistes Americana, Riley, an insect found all over the world preying on aphid feeding lady-birds. How long the parasite has been present on the islands is hard to say. Undoubtedly it had been breeding upon Coccinella abdominalis many years. It had been found upon the same by Messrs. Miller and Wait at Kona before the introduction of other Coccinellids by me. Leis conformis, Boisd, had been observed breeding upon the orange Aphis early in 1894. Another very valuable lady-bird that feeds upon the various Aphids, and one that had always been found in small numbers only in Australia is Platyomus lividigaster, Mulsant. It was met with in that country from New South Wales up to Cairns, Queensland, and chiefly upon the orange Aphis. It was also noticed that a larger percentage of their larvu were destroyed by a parasite, and owing to this fact the comparative scarcity may be accounted for. On the other hand, there is no such parasite as yet known in the islands, the beetle was never yet found destroyed by the Centistes fly and in consequence may even prove of more value in time than the Coccinella rapanta. Its dusky larva is unlike those of the Coccinella proper; it is covered all over with long spines for protection. The rather small black beetle is nearly round and has the sides of thorax bright sulphur yellow. It is a most active creature.

Of Orcus, O. Chalybeus, Boisd. has increased most upon the various Diaspidinæ chiefly, yet it will feed upon most any scale as well as Asphids. The Cryptolæmus montrouzieri, Mulsant, is in my opinion the most valuable lady-bird introduced into the islands. It is always found upon any plant infested with mealy bugs. It relentlessly follows up that destructive Pulvinaria and devours its eggs. It likewise devours Eriococcus araucariæ, Maskell, infesting the various Araucarias. You distributed the same during 1894, and on my recent inspection it was met with everywhere on all the islands upon its fast disappearing food; around the Volcano, upon the various forest trees and shrubs it was very numerous; from there down Pahala over the lava flows it was numerous upon the scanty bushes growing. In Kona it was met with up to an altitude of 6,000 feet, and here was simply swarming upon Myoporum sandwicene, Gray, infested with Lecanium fillicum, Boisduval, its larva feeding upon the Dactylopius present. On Maui it was found upwards to the timber line and is very likely even higher. That far-famed Vedalia cardinalis, Mulsant, did good work in Honolulu upon the one scale, Icerya purchasii, Maskell. The Crytolæmus beetle did equally well upon about a dozen species of coccids. Many other enemies were introduced for the Icerya scale, and one of them at least, Novius Koebelei, is at present abundant.

Of Rhizobius a large number of species were introduced, and R. ventralis, Erichson, that feeds upon the various Lecanidæ, has become the most abundant. It will feed upon Pulvinaria as well and can at any time be found upon Araucaria trees, preying upon Erioccus; owing to its valuable work, the numerous species of black scales are disappearing. At the Kapiolani Park the Casurina formerly a complete black mass, owing to the numerous Lecanium longulum, Douglas, have entirely recovered from the blighty appearance, and both the beetles and larvæ could be found in any numbers during summer. Of the smaller Australian beetles, Cyreme nigellum, Blackburn, has perhaps increased most, and it was met with everywhere in Honolulu.

With the Ceylon Coccinellids nothing could be done, the di is too great and all arrived at Honolulu dead. One of thes certainly the most valuable found there, Chilochorus circum Gyllh., was later sent over from China. This insect had recorded from Ceylon, India, and Sumatra, and consequen occurrence around Hong Kong could be expected. During months, Oct. to Dec., 1895, a careful search had been made neighbourhood of Hong Kong, and of the insects introduced are breeding in the island.

Synonyche grandis, Thumberg, is the largest known lad that feeds upon Oregma bambusæ, Buckton, infesting the v Bambus plants in the Malay Archipelago, Ceylon, China ar southern Japan. A fresh specimen of these was found upon Aphids in Honolulu on May 6, 1896, and may have bred Verania discolor, Fabr., found near Hong Kong and Swato again met with in Honolulu eleven months later; it feeds Aphids. Coelophora pupillata, Swartz, found common near Kong upon Celtis sinensis, infested with Psylla, was met w summer upon Aphis at Honolulu.

Coelophora biplagiata, Swartz, collected and sent from Kong, has been noticed in Honolulu for several months aft return. Chilomenes quartriplagiata, Swartz, had been obs breeding upon plant lice, and Dactylopius and will prove a va addition. Cryptogonus orbiculatus, Gyllh, is a very common lady-bird. It was found numerous upon orange, etc., at Japan, it was breeding by the thousands upon Mimosa pudi infested with Dactylopius adonidum, Linn,—the common bug,—at Conloong, China, and in Formosa again, it was num upon the tea plants that were infested with Chionaspis there. will be another valuable help in destroying the various mealy The beetle was found very numerous during November at Hon

(*To be concluded.*)

HYBRID COFFEE IN SOUTH INDIA.

As the subject of Liberian-Arabian hybrid coffee has for time past engaged a good deal of attention in South India Ceylon, a few particulars will probably prove of interest, especially in view of the decline in prices of tea in India and C and the prospect within the next two or three years of the ab ment of unprofitable tea lands. A recent issue of the *Kew B* refers to the subject as follows:—

Hybrid Coffee in Mysore.—What are regarded as hybrid coffee pla result of cross fertilisation between the Liberian and Arabian kinds, a cultivated in some disttrict in Mysore. The most recent information re them is that contained in a report on the Manjarabad Forests, present year to the Government of Mysore by Mr. J. Cameron, F.L.S., Supe ent of the Lal Bagh Gardens, Bangalore. It is evident that coffee pla the district believe the plants to be true hybrids. No specimens, h which would substantiate the fact have been received in this country therefore impossible to express an authoritative opinion on the subject.

Mr. Cameron has already pronounced these to be true h and his report contains a description of their origin, which, summarised, indicates that some seed yielded by Liberia which had been planted in or near Arabian, had developed two plants of a new type, combining many of the best pecul of both varieties, two of the most important points being im from leaf-disease, and productive powers of a high orde Cameron, by the way, contributed some interesting articles to *ing Opinion* early in the present year on "Fertilisation of the flower," from which the following is an excerpt bearing question of hybrids:—

Coffee Arabica or Arabian coffee, of which there are several well varieties, known by such names as "Chick", "Coorg", "Nalknad", almost exclusively cultivated in this country from the time the indus started, and it is only within recent years that one or two new varie species have been introduced and cultivated on estates. This fact will the absence of hybrids over such an extensive area, there being no ma make hybrids from. Yet, within the past few years, some hybrids ha their appearance, shortly following the introduction of Liberian coffee tinctly new species. And barring the fact that the two distinct speci been placed in juxta-position to each other the hybrids are the work of But in the instances referred to, man must get the credit of having ma helped Nature by providing a new species for the latter to work upon.

An important factor which has tended to minimise the ch cross-fertilisation between Liberian and Arabian coffee, n standing that many lakhs of the former variety have been p out in the coffee districts during the past decade, is found

act that whereas Liberian coffee blossom opens out within 6½ days f the first good shower, it fades and drops off within 36 hours; vhereas the Arabian variety requires 9 to 10 days to reach the ormer stage, and unless displaced by rain usually retains its position n the branches from 41 to 60 hours.

The first hybrid Liberian-Arabian discovered in Wynaad, about vhich reliable details are forthcoming, was observed amonget some plants grown from seed at stake (raised from Liberian seed) in 1890. This original hybrid tree is now nearly 8 years old. It has never hown the slightest signs of leaf-disease, although surrounded by Liberian and Arabian, both of which varieties have been severely ttacked by the blight year after year. The rapid growth of this riginal tree has been phenomenal, though it is on ordinary bamboo and, at an elevation of about 2,800 feet above sea level, and with an nnual rainfall of about 85 inches. The following figures furnish the rop yielded by this tree:—

1893 at 2½ years old	¼ seer	sound	parchment.
1894 „ 3½ „	„ 3 seers		do.
1895 „ 4½ „	„ 8 „		do.
1896 „ 5½ „	„ 4½ „		do.

r nearly 16 seers within the four years, so that omitting the "virgin rop," the yield was 5½ seers parchment per annum average.

So far experience shows that these Liberian-Arabian hybrids hould be planted 8 feet apart, which would give about 660 trees per cre, and assuming that each tree yielded only 4 seers parchment nnually, equal to $\frac{1}{7}$ of an imperial bushel, the return works out to bout 94¼ bushels per acre, or approximately to a ton an acre all round. An encouraging feature connected with the plants raised rom the seed of this original hybrid is that they have hitherto been ound immune from leaf-disease, although now over 4 years old, vhile their productiveness promises to equal that of the parent tree. t is believed that high, light shade is necessary to protect hybrid coffee, this advantage insuring, *inter alia*, less risk of injury from poorer. One or two noticeable peculiarities with hybrids are that he spike on this variety is always much more forward in the spring han that of either Liberian or Arabian. Moreover, the spike opens n either 7 or 8 days. The crop requires nearly 12 months to nature, and the bean is shorter and bulkier than Liberian, though of course larger than ordinary Arabian coffee. The best original ybrids hitherto observed have all been raised from seed gathered off pure Liberian, while the ensuing generation has also been found airly true to type, notwithstanding the absence of protective rrangements to guard against cross fertilisation during the flowering season.

The following is the history of another hybrid tree, which is, if possible, more encouraging than the instance already quoted. In 1892 a two-leaved seedling rooted in a basket raised from the seed gathered off a pure Liberian, was planted in semi-abandoned Arabian coffee, opened in 1862, together with Liberian seedlings. About a year later, this seedling presented such marked peculiarities that it attracted attention, its foliage differing from the surrounding Liberian plants, while it far outstripped the latter in growth. This land has a South aspect, elevation 3,400 feet above sea level, and an annual rainfall of about 140 inches, and so far this hybrid, which in foliage, etc., closely resembles the original hybrid tree first described, bids fair to equal the latter in all essential points.

It is as yet premature to judge whether hybrids grown from the seed of hybrid plants that have been raised from the produce of the original hybrid tree, will retain all the distinctive peculiarities of the latter; but as the efficient protection of the blossom from external influence is believed to insure the reproduction of the same strain exactly, the reasonable inference follows that it is merely a question of time, careful selection, both of the seed and plants, to effect the gradual introduction of the Liberian-Arabian variety all over the coffee districts. We understand that Messrs. Parry and Co. have already initiated the opening of a hybrid coffee estate in their Vellera Mulla forest. Messrs. Arbuthnot and Co. are alse planting the same species in their South Wynaad properties, while an offer of *a rupee per bean* from an original hybrid tree, for the ensuing 3 years, has been declined by the fortunate owner. Should, therefore, the favourable anticipations now held of Liberian-Arabian hybrids be realised, coffee planters have a fair prospect of profitable returns year by year in South India, and as coffee paid well in Ceylon prior to the inroads of leaf-disease, suitable lands in that island may also eventually be turned into paying coffee estates. —*Madras Mail.*

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (June 24, 1898) says:—The market at Public sales continues depressed, although the heavy snpplies begin to show signs of falling off, and values are generally easier.

About 2,200 bags East India were catalogued but only a small part sold at declining prices the remainder being bought in as the offers were a long way under valuations.

Central American kinds have also met little or no competition and a large proportion had to be bought in and the rest sold at fully 3/- to 4/- decline; except a few favourite Home Trade marks which realised steady rates.

Futures have been quiet and after some slight fluctuations close about 3d. lower on the week.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending June 22nd, 1898, says:—Bank rate 3%. Bombay Exchange closes at 1s. 3 7/32d. Brazil Exchange 7¼d. Rupee paper 3½% 62½. Silver 27⅛d. per oz.

This market has been very flat throughout the past week, and only a small portion of the heavy supplies offered found buyers at an irregular decline of 2s. to 5s. per cwt. East India is neglected, and only saleable at very much reduced prices. Ordinary kinds shew the heaviest decline, foxy Nicaragua and common Costa Rica being fully 4s. to 5s. lower. Fine colory is about steady.

Daily receipts averaged 5,500 bags in Rio, and 6,000 bags in Santos.

Futures continue quiet, and prices are about 6d. per cwt. lower, viz.:—Good average Santos in Havre, September delivery, fcs. 36.25, in Hamburg pf. 29½, and No. 7 low ordinary Rio in New York $5.70.

To-day's London official quotations are:—

HE DISTRICT ASSOCIATIONS—	
Shevaroy	... 374

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, ight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including ostage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for ine advertisements will be: 4 as. per line for the first, 3 as. for the second, nd 2 as. for the third and succeeding insertions. Five-line advertisements rom Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic ccurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," 1/12, Second Line Beach, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 11 and 12, Second Line Beach, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 29th July, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Pollibetta, 19*th July*.—*Weather.*—The monsoon continues extraordinarily light for the time of year; 25 cents is the heaviest fall gauged in a period of 24 hours during the past week, and it has varied between 5 cents and the above figure. *Crops.*—Small stuff, probably berries that did not set, is dropping off; but there is a very decent lot of large berries on the trees. *Labour.*—Some new coolies have been coming in. *Health.*—Very fair. *Interesting Items.*—One estate is said to have succeeded in raising the much-talked of hybrid coffee.

Kadur District.

Balur, 18*th July*.—*Weather.*—Fine break in the weather since 6th July, with fitful showers more like blossom showers of under half an inch. Continuous thunder to-day, which is very unusual at this time of the year. Very light monsoon compared to last. *Plant-diseases.*—The old enemy, leaf disease, is just appearing on some estates, while "Borer" is very bad everywhere. Many thousands of bored trees are taken out daily and burnt. "Black rot" is with us, but not so bad as last year. *Crops.*—Owing to failure, estimates have been reduced all round. A second pruning is being done on most estates, taking off failed wood. *Interesting Items.*—A meeting of the S.M.P.A. is to be held at the Munzerabad Club, Saklaspur, on 1st August. Election of officers and delegates takes place. A cricket team from Hubli plays against the planters at *Chickmuglur* on 24th and 25th. Many estates are for sale, and all proprietors and firms expect good crops *without* manure.

Nellampatty (British).

20*th July*.—*Weather*—until yesterday was as last reported, but then a change seems to have set in, and this morning I gauged 1·45, while there's a strong wind blowing and conditions are much more like our normal monsoon. Rain for week, 3·28 to date 47·36. We had a very distinct earthquake here on Saturday

at about 1-30 P.M. It travelled from west to east, and shook the bungalow pretty severely. It was a most weird feeling. I have not heard of any damage done. *General Health.*—Still bad. *Labour.*—'The Moplars,' who did a lot of good work out this end for the last two years, are this year few and far between. We miss them greatly, as without them fitting and heavy work has to be got out of Malayalams, and trying to get good work from them adds a year to one's life for every day its attempted, besides laying up a store of "little" swears!! *Interesting Items.*—Roads as usual vile, and one or two bridges dangerous in the extreme. One estate is cut off from this end, except by making a detour of about five miles!

THE MYSORE GOVERNMENT GARDENS.

THE Annual Report of the Mysore Government Gardens contains, as usual, a large amount of matter interesting to planters. It is a great pity that the Government of Madras seem to fail altogether to recognise the value to the public of the publication of such experimental work as is being pursued in the Nilgiri Gardens. If it is deemed derogatory to their dignity to have to pass orders on matters on which they evince necessary ignorance, when such matter is published within the pages of the Annual Report, surely there can be no objection to a record of such work, and very valuable work it is, being published as a supplement to the Report. By their present policy of suppressing what they term "technical detail," much valuable information is lost to the very public for whose behoof the experimental work is carried on.

Our little grumble over, we shall turn to the Mysore Report, confining ourselves to the section dealing on plants of economic value, under the heading of Cultivation and Experiment. Among the new forage plants tried were *Dolichos multiflorus*, from California, and the "Florida Beggar weed," *Desmodium tortuosum*, Swz. The latter proved identical with a very common garden weed, and is considered of no special value as a forage plant. Further opinion is deferred for the present.

Of special interest is the necessarily meagre report on hybrid coffee, which is again so much in evidence. Touching on Mr. H. G. Parsons' experiments in Coorg, already described in these columns, the Curator, Mr. J. Cameron, says that three of his seedlings have been presented to the Gardens for careful observation. A few seedlings from grafted coffee are also being watched. There has been much correspondence during the year on this interesting subject. The hybrids seen on the Oossoor and Ubban Estates in Manjarabad are very encouraging.

With the gradually extending interest in fruit cultivation, it is worthwhile to record what has been done in that way in Mysore. Viticulture has not been a success the past year, and owing to scarcity of water and defects in the mode of applying it, the vines in the Daria Dowlet Bagh have made but little progress. However, there is nothing radically wrong with them, and now that a good well has been provided for the vineyard, the results will doubtless improve. Pack of moisture and an over-heated soil had a very retarding effect on the production of grapes. In the Palace Gardens at Bangalore, a small crop of fruit was sold for Rs. 124. Some new varieties of strawberries were imported from England for the purpose of improving the now degenerated local strains.

Operations are still in progress for the local impr ment of *Bhere Fruit*, and trees from good stock now growing in several gardens. A donation of fine containing ripe seed was received from Mr. Step Superintendent of the Gardens at Nagpur. The seed hard, and take four to six months to germinate.

The *Tomato Tree* is doing so well at Nundydroog its cultivation might be profitably extended on the As a preserve fruit it would be found exceedingly u in cantonments and villages. But in this latitude it n an elevation of 4,500—6,500 feet. Trying to grow the plateau and lower down is only a waste of effort.

Excepting the Indore variety, which answers well on the hill and at Bangalore, the new peaches under are very disappointing. The growth is generally stu while some trees have gradually died off altoge Grafting on to the country variety is also not hop owing to the vigorous growth of the latter and the diffi of suppressing stock-shoots which overpower the s Other budding and grafting experiments are in hand.

Strawberries.—The most important introduction du the year was a small consignment of strawberry pl As local varieties of this delicious fruit have been dege ating gradually, it was considered necessary to im better kinds to subsequently replace the worn-out f But being of a herbaceous nature and very susceptib over-heating, strawberry plants require a careful cour preparation before they are safely launched on a voyage to warm countries. Having this in view, writer was in correspondence with the suppliers, Me Daniels Brothers of Norwich, for nearly a year b the plants were actually started for India. The Wa case arrived in December, 1896, with only 30 plants out of a consignment of 100 plants. This must be sidered fortunate, and is wholly due to the exce precautions taken by the suppliers. On arrival, the p were at once placed in a shaded frame, and as growth gressed they were gradually transferred from the th pots in which they had travelled into pots of a larger In this way the plants were preserved through a ceptionally dry season. Later they will be planted o beds to make runners for propagation. The names o four new varieties are (1) Royal Sovereign, (2) Sensa (3) Competitor, (4) Laxton's No. 1. That st berry culture forms a considerable item in local ma gardening is pretty widely known. When the heavy of 1896 washed away many of the gardens at Mahab war, an appeal was made to Bangalore for young pl and it is estimated that 30,000 offshoots were collecte supplied in the course of a few days, although the de was made during the planting season.

The English varieties of apples and pears under tr Nundydroog are still backward in growth. But o whole they are much more promising than the peach and it is probably only a matter of time for their he development in the hill nursery. The experiment of g ing on to the Nilgiri cooking pear has been successf far as indeed has invariably proved the case on the Ni It is also being extended, so that the trial of establi the cultivation of dessert pears by this simple means be very thorough. A few plants of the Florida pea *Conte* and *Kieffer)* were procured from the Bot Gardens, Saharanpore, and planted at Nundydroog.

alace Gardens produced some new apples of superior avour. *The American Dewberry* grows well enough at undydroog, but has not fruited as yet.

A new form of water melon from Australia has been aised from seed presented by Mr. J. Fischer of Sydney, rough his father, General Fischer, R.E. It is a prolific ant, and the fruit, which is oval in form, is large and rnamental. Seed will be secured shortly for distribution.

On the important subject of rubber, we learn that the onservator of Forests, Pegu Circle, Burma, has been good ough to furnish seeds and plants of *Urceola esculenta*, enth., for trial. But it is doubtful if the species will cceed in the dry climate of Bangalore. In Burma, it is extensive woody climber yielding a superior kind of outchouc, and best known to local science by its older me *Chavannesia esculenta*, A, D C. In reply to certain quiries made by Mr. Cameron, the Assistant Director of ew Gardens has been good enough to give the following formation on exotic rubber trees, which will be interest-g to planters and others :—

SIR,—In reply to your letter of the 26th June, in which ou state that European planters not only in Mysore but the adjoining Presidency of Madras are applying to you r seeds of rubber-producing plants, and that you are ishful to know whether this establishment could procure r your Government a few bushels of fresh seed for local stribution, I am desired to inform you that the most nvenient means for obtaining such seed would be from e Botanic Garden in Ceylon, where the crop of seed of *evea brasiliensis* in August next is estimated to be 75,000.

2. Seeds of *Castilloa elastica* may also be obtained om the same source or through Messrs. William Brothers, eed Merchants of Heneratgoda, Ceylon, who advertise oth seeds and plants of this species.

3. It is doubtful whether either of these trees will thrive the elevation suitable for Arabian coffee in Southern dia. They are both natives of comparatively low untries in tropical America and require great heat and oisture. They may very well be tried as shade trees for cao, but so far as we know at present they have not en successfully grown in mountainous districts, and what u report in regard to their behaviour at Bangalore ould appear to confirm this.

(Signed) D. MORRIS.

Of Castilloas (*Castilloa elastica*), there are eight trees the gardens, the largest being ten feet. Considering eir age, six years, this growth cannot be considered good. his of course is due to the long dry season of Mysore, hen these moisture-loving plants make no progress hatever.

Writing on Erythrinas, surely Mr. Cameron makes a ip when he mentions *Erythrina lithosperma* being a ecimen of *E. umbrosa* ? In Java *E. lithosperma* is con-dered so different, botanically, from the other Erythrinas, at it is not classed as being of the same species at all, and not ever named Erythrina. By the way, it is interesting note that the two species of African Erythrinas, *E. umei* and *E. Caffra*, are doing well in the Gardens, where ey have been for the last four years, and the last named now in fruit for the first time.

With regard to fibres, a number of seedlings were raised of Egyptian cotton, but most of them were unfortunately lost during the subsequent water scarcity.

The movable nursery stock of Rhea has been increased to about 10,000, while ground plants are now in a condition to double the above number at short notice. Rooted offshoots are offered to the public at Rs.50 per 1,000, but as yet there is not much demand for them.

Experiments in the local cultivation of the Japanese camphor tree (*Camphora officinalis*) have been started on a small scale. Eight healthy seedlings have been planted out, some in the open and others under partial shade.

Of the West Indian Cherimoyer (*Anona cherimolia*), only three small specimens are growing in Mysore, of which the ones at Nundydroog are doing best. On the Nilgiris, by the way, the best elevation has been found to be about 4,500 feet, though they grow fairly well up to 6,000. We believe though, none of the Nilgiri plants have yet fruited, though those on the Shevaroys fruit splendidly.

Anona Cherimolia.—West Indian Cherimoyer.—At present we possess only three small specimens of this useful tree. Growth has been slow. *A. macrocarpa* and *A. montana* are more vigorous in growth. At Nundydroog, specimens of the former are 8-10 feet high with every appearance of healthy development. These are also West Indian trees.

Cassia eremophylla and a few other new species are growing well in the shrubberies.

Castilloa elastica.—There are eight trees planted in the Gardens, the largest being ten feet. Considering the six years these trees are down, the growth cannot be called good. This is attributed to the long dry season when the species makes no progress whatever.

NOTES.

Rhea. What has been, and is being, done towards determining the potentialities of Rhea as a new product for South India planters or agriculturists ? Will any planter who has made experiments kindly state a few of the results for the information of the planting community ? Reports from Ceylon show that practical experiments are in progress, but it is perhaps too early to say much about results.

Cardamoms. Notwithstanding the moderate quantities of cardamoms which have been offered during the past month, only about one-fourth has changed hands at prices which show a decline of 4*d.* to 6*d.* per pound according to home advices. Supplies are more than ample for the present demand, and we fear that prices will go even lower. Ceylon, Mysore character, small to fine pale bold, sold at 2*s.* 3*d.* to 3*s.* 4*d.* per pound ; Malabar character, medium palish, at 2*s.* 4*d.* to 2*s.* 8*d.* per pound.

India rubber. The demand for India rubber continues good, and prices show a further advance report English papers. Enquiries are generally for medium kinds, which, being scarce, command high prices. Para fine is worth 4*s.* 1*d.* per lb. ; Mozambique, good red, 3*s.* 3*d.* ; fine clear white ball, 3*s.* 2*d.* ; Rangoon, good red, 3*s.* 2¼*d.* ; Assam, good to fine, 2*s.* 8*d.* to 3*s.* 2*d.* ; Penang, fine red, 3*s.* 1*d.* ; good white, 1*s.* 10*d.* ; Borneo, fine,

2*s.* 3¾*d.* Java, good clear 3*s.*; Madagascar, fine pinky and white, 3*s.* 2*d.*

Curing of tobacco. Successful tobacco-growing does not consist only of producing fine healthy plants with good leaves, states our interesting contemporary, the *Produce World*. "To find, and hold, a profitable market, planters must also contrive to secure good curing. Judging from a shipment which has recently reached this country, this latter point is the only one in which Queensland tobacco requires improvement. The consignment included about five cwts., and smokers who have tried it state that it smokes like bird's eye, while the leaf resembles Kentucky. On the high tablelands of the Southern Downs there are some millions of acres suitable for the growth of tobacco, and already Queensland is said to produce more of the 'weed' than the United States. We should advise tobacco planters in Queensland, as we advised those of Jamaica, to take special steps to ensure suitable curing."

A big combination. The complaint of tea planters that the distributing trade is getting more concentrated into the hands of a few big firms, who are thus able to control prices, is about to receive another striking illustration, writes a contemporary. The properties of the Ceylon and Oriental Estates Company, Limited, and other large tea and cocoa plantations in Ceylon are to be amalgamated with the two distributing businesses of Messrs. Cooper, Cooper and Co., and Messrs. Johnson, Dodds, and Co. The result of the consolidation will be that the products of a cultivated area of upwards of 10,500 acres, together with the future output of a further 9,000 acres at present uncultivated, will be distributed by two agencies, the one having 100,000 customers on its books, and the other upwards of 20,000 wholesale accounts. The total capital of the new company will amount to £590,000, divided into 5 per cent. debentures, 6 per cent. cumulative preference shares, and ordinary shares. The freeholds to be taken over are valued at £390,000, and the cash, liquid assets, leases, etc., will represent a further value of £116,000, without taking into consideration the trade marks and valuable goodwills. The board is composed of men, most of whom are intimately connected with the tea trade.

The Currency question. For some time it appeared very doubtful whether the Indian Tea Association would side with the U.P.A.S.I. in respect to the Currency question. Doubts have now been set at rest, however. The Assam branch of the I.T.C. has spoken out, as will be seen from the copy (published on another page of this issue) of a letter from Mr. Tye, the Secretary, to the President of the Indian Currency Committee. This letter declares that the "effect of the present currency policy on the tea industry of India is already seen in diminished profits, as shown by the published accounts of various Tea Companies. Every penny added artificially to the value of the rupee will reduce the profits of the industry this year by £250,000. The distrust which has been created is also putting a stop to the further extension of tea cultivation in India, and will, it is feared, divert capital from India to China, for the purpose of developing the tea industry in the latter country under European supervision, and with modern methods of cultivation and manufacture. future of Indian and Ceylon teas will depend largel their increased consumption in countries outside the U Kingdom, and the burden placed on them by the arti value given to the rupee will put them at a serious d vantage in competition with China tea." These are important statements, and unless they can be refuted sh materially affect the decision of any impartial Curr Commission.

Bananas and plantains. The views we have persist put forward as to the possibili Indian and other planters developing to a much gr volume than has yet been done the trade in banana plantains, says the *Produce World*, are gradually ma headway, we are pleased to see. The subject was the first taken up vigorously by our contemporary, *Pla Opinion*, and now we are reinforced by *Indian Gard* and the *Madras Times*. Both these papers now per that there are great possibilities not only in banana and flour, but also in the establishment of a green trade, especially as there are Indian varieties unequ for appearance and flavour by any bananas in the w The great difficulty in the way of a green fruit trade recognise as, of course, that of cold storage and the sent inadequate accommodation in Indian liners, whi exactly what we have been urging upon planters for mo as well as the great advantage the development of a port fruit trade would be both to India and to this cou Of course, the assistance of some of the Land Records Agricultural officials in conducting experiments as t initiation of the trade, suggested by one of our conte raries, is not to be despised, but we have more faith i utility of planters combining and, through their associa bringing to bear upon the carrying companies that pre which will give them what they want. On almost tropical estate there are great quantities of various allowed to rot, simply for want of the facilities to get to markets where they would be eagerly snapped up ; would be of the greatest assistance in making ends m

---

A dangerous move. We do not wish to damp ardour of the writer of the a writes the Editor of the *H. and C. Mail* after a *brief r* of the *Ceylon Observer's* anti-broker crusade scheme, al noticed in these columns. Ceylon planters we kno enterprising enough for anything, and if 1,600 planters to supply their friends with samples of superior tea effect might be electrical. It is well to point out, hov in justice to the distributing firms, that they, or at some of them, have spent large sums in advertisin pushing tea. It is quite true that in the first ins they were apathetic on the subject of Indian and C tea, and so long as China held the field they were co to ignore British-grown tea, leaving planters to d pioneer work, and when the public began to recogni merits of Indian and Ceylon tea, the dealers, wholesal retail, took advantage of the new departure. All true. It cannot be denied, however, that when on public taste for tea had been tickled in the right dire the dealers helped things along very considerably. work of popularising these teas had been left to supply associations, the work of supplanting China

ave made but slow progress. Farmers and fruit-growers ave tried the direct supply system, but the consumer is a ieer customer, and it takes him a very long time to think it new methods. The large tea dealers or distributing rms may be all that the *Observer* thinks they are and more, ut they too have the bugbear—keen competition—to con- nd with, and although large profits are made by success- l tea-dealing, an extensive knowledge of the business is equired. These terrible distributing houses may be great nners, but they have their uses, and we think that were ie advice of the *Ceylon Observer* followed, some regret ould also follow in its wake.

---

he yield of Para Rubber.

There has been such an immense deal published about the rubber questions, that we daresay many of ur readers are not a little puzzled between the different eports in the capabilities of the various species. It will e useful, therefore, to give the following facts. If the only nd available is unsuitable for the better kinds, *i.e.*, is ather high (4,000 to 5,000 feet), with poor soil and a dry imate, then Ceara (*Manihot glaziorii*) may be extensively lanted. It is an extremely hardy plant and needs little r no care. Castilloa (*Castilloa elastica*) must have a rich umid soil, with a hot climate. The same with Para (*Hevea raziliensis*), the yield of which is the subject heading of his paragraph.

At Kuala Kangsar (Straits Settlements) sixty trees, *mostly nly six years' old*, were tapped for some few months ontinuously. The yield per tree worked out to the emarkable average of ten ounces of marketable rubber er tree. Remarkable, that is, for the youth of the trees xperimented on. A few trees, twelve years' old, produced ome three pounds of rubber each.

After dealing with the method of tapping and curing, he writer of the Government report on the subject dds that the Kuala Kangsar trees are mostly planted on et land, subject to flooding every year, though some are n high land. The tree, however, appears to be the most daptable of all the *fichus*, thriving on any ordinary soil, rom swampy sands to an elevation of several hundred eet. The writer of the report is of opinion that it is not ecessary to plant more than 15 feet apart, that a five or ix years' old tree will produce $1\frac{1}{4}$ pounds, and a tree hirteen years' old 5 pounds of rubber without injury. The ost of tapping on a large scale he estimates at 30 cents about 7*d.*) per pound.

Samples of the rubber thus obtained have been submitted o a London expert, who reports that, though imperfectly moked, the product is worth 2*s.* 9*d.* to 3*s.* per pound, and dds that, although Straits rubber is generally much nferior to that coming from South America, it is quite qual to Para.

The Florida velvet bean again.

With reference to the extract from the *Spectator* that we published some weeks ago, the following letter o the same paper, giving the reverse side of the shield, hould be read with interest:—

I send an extract from an American paper received this norning from a nephew who has worked for many years in Florida. "The bean," he says, "is very much in its xperimental stage as yet. I have seen it growing for three years now, but do not care for it as well as two other land-building plants we have in Florida." "Land-building plants are a great help to our Florida sand, but are by no means a fertiliser; and the man who depends on them for such gets (to use a slangy expression because I cannot find the proper term) badly left." "The item that I enclose was copied from another agricultural paper, the *Datil Pepper*. Could you send it *Spectator* as answer to the Orlando letter?"—I am, Sir, &c.

H. F. B.

P.S.—The *Spectator* article mentions the *dry* bean as fit for table use, and I see it was *green* shelled bean which seemed unwholesome, though ripe beans in pods are mentioned as refused by horses.

"I was induced to plant about two acres of them (velvet beans) last spring upon thin land. The beans grew nicely, and made a large amount of forage. As they were recommended as good food—both vines and beans for stock, and also regarded by some as edible table food—we cooked and ate a lot as green shelled beans. Quite a number were sick, some before leaving the table, others later—even to twelve hours afterwards. Two who were not affected, and doubting that the beans were the cause of the trouble experienced by others, ate some cold the next day, which 'fetched 'em.' Some were seriously affected, but all recovered after two or three days. Symptoms were nausea, purging of the bowels, headache, and violent action of the heart. Afterwards, some were fed to chickens, both cooked and raw; some of the chickens died, and the beans were found, on examination, to be still undigested. Horses refuse to eat the ripe beans in the pods, and, in view of our experience, we do not care to urge them by grinding and mixing with other food. Will not our experiment station test and analyse them for poison, and tell us what is its extent, and how to overcome it?"

West Indian Pimento.

In well-informed quarters there is a general belief that the crop of Pimento which will shortly begin coming to hand will be larger than during the past two years, consequently buyers show a tendency to postpone operations in the hope of prices falling, says Messrs. John Haddon and Co's organ, the *Produce World*. For some weeks there has been nothing of moment doing at the various sales, though a small private business has been transacted at about $4\frac{1}{2}d.$ per pound for fair quality. Meanwhile it is expected that, as larger supplies arrive, prices will gradually fall until about three pence will be accepted about the end of the year. Still we see no grounds for Pimento producers despairing, even if so low a mark is reached; it will be twenty per cent. better than before 1896, at which time supplies ran short and prices began to rise until they gradually reached five pence, or double what they had previously been. On the contrary, planters will best consult their own interests by continuing the cultivation of Pimento as an auxiliary to other produce and using their best endeavours, by careful pruning and skilful drying, to turn out only berries of the best quality. The present fall in prices is evidently not due to the overstocking of the market so much as to the hopes of purchasers that the arrival of the new crop will force down values.

Pimento, or as it is invariably named "Allspice" and "Jamaica Pepper," is the produce of a handsome bushy tree indigenous to the tropics of the western hemisphere, and

the value exported from Jamaica in 1890-91 is given as £81,326. The best time for gathering the berries is when they are nearly ripe, as then their essential oil is most abundant, and the aroma which gives the ground product the composite flavour of cloves, cinnamon, and nutmeg—whence comes the name "Allspice"—is at its finest. The method adopted for drying the berries has hitherto been to spread them upon sheets on wooden platforms exposed to the sun, frequently turning and winnowing them until the process is completed. An oil, known as the Oil of Pimento, and an aromatic stimulant chiefly used for adding warmth and flavour to other drugs and in the production of artificial "mineral waters," is also distilled from the berries.

The plant belongs to the genus *Eugenia*, of the *Myrtaceæ* order, various species of which are found throughout the tropics. Besides being largely cultivated in Jamaica and other West Indian islands, it abounds in a wild state in British Honduras, Guiana, and Brazil. Another species is the Malay Apple, or *Bitter Eugenia*—which also yields Pimento—and the *Eugenia Jambos*, which produces "Clove Apples." Various species also exist in the Malay Archipelago and the South Sea Islands, and doubtless the Jamaica species could be profitably cultivated in all our possessions situated in similar latitudes and having approximately the same climate.

More about vanilla. At a recent meeting of the New York College of Pharmacy, five papers were read on vanilla. Professor Rusby treated of the cultivation, etc., of vanilla. He said that there are thirty-three species of vanilla now recognised. The process of curing vanilla-pods and preparing them for packing was described as he had seen it done in South America. Vanilla-packers, he mentioned, are subjected to poisoning, resulting from handling the beans, the symptoms being much like those resulting from poisoning, due, he thought, to penetration of the skin of the hand by oxalate-of-calcium crystals. Dr. S. E. Jelliffe treated of the microscopic side of the subject, and said unscrupulous dealers often used benzoic acid to make a false appearance of vanillin on the beans. The microscope revealed the fraud readily, benzoic-acid crystals being flattened and rhomboidal, vanillin acicular and standing out at right angles from the surface of the fruit. Professor V. Coblentz treated of the chemistry of vanillin and said it was frequently adulterated with a cetanilid. Mr. A. Henning's paper was on the commercial varieties of vanilla. He said that that from the Seychelles Islands, an inferior kind, was the sort chiefly used in England. The Mexican vanilla grown at Papantla had the most exquisite odour, and was the kind used in the United States. The pharmacy of vanilla was considered by Mr. O. Kalish, who recommended an extract made from a formula containing eight ounces of vanilla in a gallon of finished produce. He said that vanillin could never displace vanilla as a flavouring-extract, as it lacks the delicate flavour of the natural bean. In the last bulletin issued from Kew Gardens, attention is drawn to the cultivation of vanilla in Seychelles, which appears to be at present in a comparatively prosperous condition. The cultivation of vanilla, it is pointed out, only dates back to about twenty years ago, and is only now beginning to be thoroughly understood. The Mexican system of allowing the vines to grow under trees nearly wild is almost universally adopted at present, and is a decided improvement on the old system of tra the vine on artificial supports. Nothing pays better vanilla. Its production costs the planter 3 rupees pound, and as prices vary from 8 rupees to 16 r the pound, a net profit of from 5 rupees to 13 rupe the result. This year the average price was 15 r the pound. The yield may be taken to be 200 po an acre. Taking, therefore, an average of 10 rupee acre of vanilla should produce 2,000 rupees. Mo the land in Seychelles is in the hands of private ow and it is difficult to estimate its cost, but it may be t that land can be bought at from 100 rupees to 200 r the acre. It has been stated that landowners are re ant to part with their land, but not much difficulty be apprehended on this score, provided that purch are prepared to pay ready money. There is some belonging to the Government well adapted for va cultivation which can be leased for periods varying nine to twenty-one years.

Coffee and Tea Market. *Coffee.*—The amount brough auction though heavy has sho very decided falling off compared with the last few we says the *P. M. Review* of 25th ultimo. The demand from the country and for export has continued quiet, in consequence, sales were only effected with diffi and generally at a decline. Though the bulk of that off has consisted of Central American sorts, a fair quan of East India was also catalogued, but as offers only made on such a decided decline, nearly the w was withdrawn, and importers have determined to wait there is more disposition to buy. Of the Costa Rica offe the few lots of fine met with a strong demand and full p were paid; the lower grades, however, could only be disp of at a reduction of about 2*s.* per cwt., but at the de there has been more disposition to buy and a fair busi has been done during the last few days. In the tern market there has been very little change, though Brazilian exchange has fluctuated from day to day.

Indian Teas.—The feature of the market has been increased quantity of new tea brought forward, repres ing several districts, but the quality was on the whole fairly good, and the prices realised were irregular. T from the Assam and Dooars gardens were of fair ave quality, the latter, in many cases, showing an improvem and these were well competed for, and brought good pr The former, however, with few exceptions, were no attractive as those previously offered. New Darjeel were more plentiful, and occasionally the quality was be

an the earlier shipments; where this was the case the mand was active at firm prices, while the more ordinary s sold irregularly and at lower rates. Sylhet and chars were generally poor, and attracted little interest, en at the lower prices ruling, and, judging from the most cent information, they are likely to continue undesirable d in short supply in consequence of the extreme drought. the old season's the bulk consisted of the common kinds, lues were mostly easier, and a larger quantity was obtain- le under 5½*d.*, while the few good liquoring lots were well d for at firm rates. A late telegram from Calcutta reports the public sales all kinds were rather firmer, but it pears from the average price paid that a considerable rtion of the teas consisted of inferior kinds. The public les here comprised 10,273 packages, 1,094 being with- awn, and about the same quantity will be brought forward xt week.

gar planting. Sugar has mainly attracted the attention of Europeans from its anufacturing and refining side, so that in advocating an amination into its possibilities from the planter's point view, we are taking up a somewhat novel position. Yet, the following excerpt from the London *Grocer* is correct, r. Leather seems to think there are great possibilities, en from the ryot-managed industry. With the decay of e sugar-cane industry in the West Indies, owing to mpetition from the beet-root growing countries, we tice the simultaneous rise of the sugar-cane industry in r great Indian Empire, writes our contemporary. A great petus has recently been given to this country by the overnment of India, which is determined to set it upon a roper scientific basis. The number of acres which is under ltivation in India is rising every year, and at the present oment there are about three million acres of land devoted the culture of the sugar-cane. Though most of the sugar grown in the North-Western Provinces and in Bengal, the op is, nevertheless, very well disturbed throughout the hole of India. Indeed, in many parts every village has at ast one or two plots. At the rate matters are progressing, e enthusiasts have some justification for the belief that hatever attempts may be made to make sugar dearer by gislation will probably be neutralised by the increased out- t in India. There the natives working in the sugar-cane elds can live on a handful of rice and a pinch of curry-powder er day, and consequently wages are at an inconceivably w point. Add to this the great extension of the Indian- ilway system, and it becomes clear that India will soon be one of the cheapest sugar-producing countries in the world. At the present time India exports about 63,000 tons of sugar per annum. It is true that 100,000 tons of sugar is imported, but this is chiefly of a very refined kind, and it is estimated that when India takes to sugar-refining in earnest, instead of contenting herself with producing raw sugars, all importations will cease. In India, too, it does not appear to be so necessary to resort to heavy artificial manuring as it is in the West Indies, where, it is said, the soil is more or less exhausted. The output per acre is from one to four tons of sugar. At a recent meeting of the Liverpool Section of the Society of Chemical Industry, Dr. J. W. Leather read an extremely interesting paper, in which he described the investigation which he has recently concluded on behalf of the Government of India, relative to the growth of sugar-cane and the manufacture of the raw sugar. The paper is well worth reading and studying, but most of it would only be appreciated by those who are actually engaged in the industry. What interests us most as a trade is, of course, the certainty that India will be a great producer of sugar in the near future. And little wonder that she will be when we reflect upon the advantages which we have already mentioned as possessed by India, and compare the startling fact that, whilst in India three or four tons of sugar per acre is considered to be an average output, in Europe the maximum yield is only 1·28 tons per acre, and in the West Indies 1·8. Mr. Sigmund Stein said in the discussion which followed the reading of Dr. Leather's paper: "It is astonishing that in the crude state of the sugar industry in India such a large yield per acre can be produced. Evidently we need not fear that the near future has dear sugar in store for us."

COFFEE SHADE TREE.

[Will "TODA" please reply?—ED.]

LADY-BIRDS.

SIR,—There is a rumour that all the "lady-birds," that were to do such a wonderful lot of good to the planting community, have died on the voyage to India. If this is true, it proves conclusively what I wrote to you a year ago, viz., that the introduction of the lady-bird in hopes of getting rid of the green bug is all "Bosh."

"BOSH."

KADUR DISTRICT,
18*th July*, 1898.

THE WIND ON THE ANNAMALAIS.

SIR,—I have just seen in your issue of July 2nd a query as to how wind treated us this year on the Annamalais. There was, if anything, more than usual on the northern slopes, and the coffee looked very blown when I saw it early this month. On the western slopes, or rather, plateau, we have had no wind at all, though our rainfall is 25 ins. less up to date than we gauged last year, when the fall, judging from Calicut and Cochin, was abnormal, and amounted with us to 150 ins. We may expect something between 90 and 110 ins. in an average year, as far as

I can judge. I may add that this monsoon has been perfection for planting, and that plants put out a fortnight ago have made roots at a great rate. We evidently get no wind at any time on properly selected ground.

E. G. WINDLE.

KOTAGIRI, *July 15th.*

ARTIFICIAL MANURING.

SIR,—In these days of short crops and talk of "coffee going out," it is difficult to understand why artificial manures are not more generally used. I am in a district where very few, in fact no planter uses more than the old fashioned bone and poonac, which he has applied to his exhausted trees forty years ago. Except in a few cases *lime* has never been tried, and from my experience I have found lime to be very necessary, especially in the growth of young vacancies. A few planters have tried nitrate of soda, but they forget that the nitrogen does not enter into fixed combination in the soil, but nitrate is dissolved in the soil water, and unless taken up by growth of some kind, it must pass into the drains, or into the subsoil beyond the reach of the roots.

Superphosphate has (I think I may say) *not* been tried in this district, but from my experience in other districts, it is a most wonderful manure, especially in a heavy soil.

Before using artificial manure, the local conditions must be thoroughly understood, the weather since the application of the manure must be looked to, and above all one must have a knowledge of the soil and its constituents.

A book which ought to be as important as a check roll should be kept, and fields marked to show what manure has been applied and when. Nowadays superintendents have to leave estates for many reasons, chiefly the impecuniosity, of proprietors (or as in my estate the change of proprietors), and unless they keep a record of manure applied, &c., the in-coming manager works in the dark and probably spoils a lot of good work done by the former man.

A certain proportion of manure of any kind always lies dormant for a time, and the coffee tree must be manured regularly if regular crops are wanted, and in this part of the world this important work of manuring is greatly neglected.

GREEN BUG.

Kadur District.

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U.P.A.S.I.]

THE Director of the Government Cinchona Plantations, Nilgiris, reports that the system of purchasing bark to supplement the yield of the plantations has so far been a success from the Government's point of view. As there is a considerable saving effected in freight and Home charges by the opening of a market at Nedivattam, it is presumed that the planters whose bark was accepted have benefited.

The Secretary of State has intimated that Her Majesty the Queen, Empress of India, has been pleased to accept the address and the casket presented by the United Planters' Association of Southern India on the occasion of the celebration of the completion of the sixtieth year of Her Majesty's reign, and has commanded that Her Majesty's special thanks be conveyed to the Association for this loyal offering.

An important suggestion regarding the employm an Agricultural Chemist in Southern India has ema from the Mysore Government, through the British Res It will be considered by the U.P.A.S.I. A short tim there were expectations that an Agricultural Ch would be engaged by the above Government for serv the Mysore State alone, but it has been decided that would not be work enough there to occupy the whole of such an expert.

THE CURRENCY QUESTION.

[VIEWS OF THE INDIAN TEA ASSOCIATION, ASSAM BRANCH

MR. J. BUCKINGHAM, C.I.E., of Amgoorie, Chairman, Assam I Indian Tea Association, has addressed to the Secretary, G ment of India, Finance and Commerce Department, Ca the following letter dated 20th June:—

SIR,—With reference to despatch No. 70, dated Calcutta, the March, 1898, from the Government of India to Her Majesty's tary of State for India, I have the honour to lay before you th of tea planters representing the Assam Valley.

We cannot help viewing with the greatest alarm the recom tion of the Government of India that, under the present cont state of our currency, a sum of 10 crores of rupees, or ever should be annually abstracted from active circulation and down as a reserve to be held against note issue. Clause 12 despatch states "that it will be seen that proposal is no new but one which has from the first been advocated by the Gover of India." We respectfully submit that the closing of the mi already accomplished its object, as far as the Government of is concerned, by placing its revenue on a satisfactory footi this has been done at the cost of commerce and export trade cannot, therefore, see any reason for now introducing a met still further increasing the present stringency of the money m however necessary it might have been considered in 1893.

It has been very rightly stated that injury to trade cannot be a as an argument in favour of any measure, until the facts upon it is based are produced. I trust, therefore, that the fol summary of facts, brief though it is, may be accepted as a p the existing depressed state of trade generally, and especially tea industry.

The Calcutta tea market is regulated entirely by the L market, *i.e.*, if prices fall in London, there is an equivalent Calcutta.

With exchange at 1*s.* 2*d.*, 1lb. of tea sold at 8 annas in Calc equivalent to 8·86 pence in London, that is taking freight, a and warehouse charges into account; but, with exchange at the equivalent of 8·86 pence in England is only 7 annas in Ca and so it is that, for every penny rise in exchange, we, the prod incur a dead loss of ½ anna per lb., or a little over 6 per ce there was a corresponding rise with exchange in the price of London, our position would be stronger, but unfortunate opposite is the case; there has been for years a gradual fall value of tea, and this, coupled with the high bank rate, causes little anxiety as to the future of tea.

Charges connected with the manufacture of tea have been re to the lowest limit, and the margin left for a profit with exc at 1*s.* 4*d.* is simply *nil*, except under particularly favourable c stances in the matter of locality and labour.

Taking, therefore, the yield of Indian tea at 150,000,000l loss to growers on every 2 pence rise in exchange would b 7 million rupees. The actual amount of loss, as shown by the exchange on 150,000,000lbs. of tea, would be a little over 9 rupees, but I have deducted 22½% for home charges in the tea sold in London (the balance of 77½% being remitted to I cover cost in production), and I have also deducted 22½% for charges from the realization of teas sold in Calcutta.

The market value of last year's crop of tea represented 8 crores of rupees, and for the last eight years the average increase in yield has been about 7 million lbs.; the additional

required to meet such increase may be safely estimated at 4 million rupees annually.

We fail to see that any successful attempt has yet been made to ascertain the amount of additional capital required to meet the increased demands for commercial industries in India and the increase of the population.

Anyone who takes a broad view of Indian trade as it is at present must admit that it is restricted by the insufficient supply of silver; everything points in this direction. The high rate of discount demanded by banks, brought on no doubt in a great measure by the enhanced value of the rupee, is a serious drawback to commercial progress. We in Assam, who in past years had no difficulty whatever in securing our monthly cash requirements from the Marwaries, at a discount of As.8 per cent., cannot now secure the amount required at even As.12 and Re.1 per cent., and we have to import rupees from Calcutta at great risk and heavy cost.

The number of spurious rupees in circulation in Assam will require the serious attention of Government, and we cannot help thinking that the recent discovery at Lahore of illicit coinage is only one instance of the enormous extent this profitable conversion of bullion into rupees is taken advantage of owing to the fictitious value of our coinage.

We would also point out, with exchange at 1*s.* 4*d.*, the great disadvantages we should have to deal with in competing with China and other countries where silver is taken at its intrinsic value.

Looking at trade generally, I may mention that in the report of the foreign trade of Calcutta for 1897 the total trade returns with the United Kingdom show a falling off of 8% imports and exports, being Rs.41,17,45,761 in 1897-98, against 45,02,57,267 for the previous year.

There being such a number of conflicting interests at stake, we are cautious in making any suggestion as to a method to be adopted to bring about a successful issue to the much-vexed question of Indian currency. We may justly claim that our share in promoting one of the greatest industries in India has been a prominent one, and we would protest in the strongest terms against any artificial means being countenanced by the Government of India to further bolster up exchange, as such a course merely results in the extinction of the margin of profit to the Indian producer.

We, the Assam Branch of the Indian Tea Association, cordially support the resolutions come to by the General Committee of the Indian Tea Association, viz.—

1. That a gold standard is not needed in India, even if it be practicable to establish it.

2. That the cost of establishing it (with or without a gold currency) is prohibitive, and that an undue proportion of such cost will fall upon tea-growers.

3. That, in the opinion of this Branch, the Indian Currency Commission should be directed to enquire into the question of how to reopen the mints to the free coinage of silver with the least inconvenience to the trade of this country.

COFFEE AND RUBBER IN MEXICO.

LAST mail brought us from America a very handsome volume on the above subject, accompanied by the following note from the author, says the *Ceylon Observer*, Mr. M. Romero:—"Washington, June 11.—I have the pleasure of sending to you by this mail, at the request of Mr. Hawthorne Hill, editor of the *India Rubber World*, of New York, a copy of the book I have just pulished in New York entitled *Coffee and India Rubber in Mexico*, which contains two papers that I wrote several years ago on the culture in Mexico of both staples, which may be of some interest to you. In my paper on 'Coffee Culture' I make frequent reference to its culture in Ceylon." The full title of the work is "Coffee and India Rubber Culture in Mexico preceded by geographical and statistical notes on Mexico, by Metras Remero—G. P. Putnam's Sons, New York and London, 1898." We cannot more tersely or exactly explain how Mr. Romero came to write this book, or how he gained the necessary experience, than by quoting the first portion of his introduction as follows:—

"When, after serving five years, from 1868 to 1871 as Secretary of the Treasury in Mexico under President Juarez's administration, I was obliged to resign, my health being so greatly broken down as to make it impossible for me to continue discharging the duties of that responsible, and at the time, very difficult office, feeling that if I remained in the City of Mexico, I could not regain my health as I would be subject to continual mental excitement, I made up my mind to live in the country and occupy my time in agricultural pursuits. Before deciding what branch of agriculture I should follow, I made a tour of inspection to the most favoured regions of Mexico and found that india-rubber and coffee raising seemed to be the most promising and profitable undertakings. The place which I thought best adapted to both of these products was the district of Soconusco, one of the counties of the State of Chiapas, in south-eastern Mexico, bordering on Guatemala, and I concluded to settle there and apply myself to coffee and india-rubber culture.

"In the meanwhile, coffee raising had attained considerable development in Guatemala, the Guatemalan coffee being very highly esteemed in foreign markets, and I determined to make a tour of inspection in Guatemala and examine the principal coffee plantations, in order to learn what was the best way to make a plantation and keep it productive. I, of course, tried, during this time, to collect all the information I possibly could about these two branches of agricultural industry.

"Finally, I undertook to make a coffee plantation in the high lands of Soconusco—located from four to five thousand feet above the level of the sea—as, in my opinion, a temperate zone is the proper one for that tree; and another for india-rubber in the lower lands of the district, which are warm, damp and marshy. I acquired some experience by these experiments and I made a study of the subject, not only in coffee plantations in Mexico and Guatemala, but in other countries where I understood coffee raising was also very prosperous like the Island of Ceylon, in the East Indies, and Brazil, which is now, and has been for many years, the largest producer of coffee in the world."

Mr. Romero eventually visited every coffee district of Mexico, so that he ought to write with a full knowledge of his subject. The first edition of his book—a small manual—came out 25 years ago, and it ran afterwards through several editions. When the price of coffee began to rise rapidly in 1890, great attention began to be given to Mexico with its grand advantage of proximity to the United States, the greatest coffee-consuming country in the world. Mr. Romero mentions that the maximum price obtained was 35 cents in silver; but that the price fell rapidly in 1897 until 12 cents was reached, and yet even that proved remunerative. Still we think the Ceylon planters who recently visited Mexico did quite right to hold off purchasing coffee property there until they saw what the course of the market was likely to be. The total production of coffee for Mexico on 1896 is given as follows:—

	LB.
Cordoba produces	10,000,000
Huatusco and Coatepec	10,000,000
Oaxaca	6,000,000
Tabasco	5,000,000
Chiapas	3,000,000
Other Districts	26,000,000
Total ...	60,000,000

Or nearly 536,000 cwt. The only chance of maintaining the remunerativeness of the industry, we should say, must lie in introducing the Ceylon system of careful pickings of ripe cherries only, pulping, drying, separating, &c., in fact that careful "preparation" which gave "plantation Ceylon" so high a reputation.

But the strange fact is that the recent Ceylon visitors to Mexico did not pay a little more attention to "rubber," the coming product

and one so much in demand at handsome prices. Here is what Mr. Romero has to say with a quotation from a Report by the British Minister:—

India Rubber.—The lowlands of Mexico, especially those adjoining the Pacific Ocean, which have a very warm and moist climate, are very well adapted for the india-rubber tree, which attains a large size and yields a considerable amount of india-rubber. We used to have whole forests of them, which fact shows that they were in their proper conditions of soil and climate, as they could outgrow the rank vegetation of the tropics, and prevent the growth of most of the other large trees in the forests; but india-rubber gatherers have destroyed most of them, and I imagine that there is a comparatively small number left.

I have always thought that the production of india-rubber would before long cease to be sufficient to supply the demand, and that, therefore, the value of that article would increase with the lapse of time. Now it is to be expected that the enormous expansion during the last few years of the cycle-tire, electrical motor-car, cab, and kindred industries will lead to the bestowal of increased attention on the world's rubber supply, which is so intimately associated with the existence of these industries.

Thinking that a plantation of india-rubber trees would be very remunerative, I devoted considerable attention to that subject, and in 1872 started one of 100,000 trees in a place admirably located for the purpose, bordering on the Pacific Ocean and between two large rivers, in the same district of Soconusco. In an article published in 1872, under the title "India-Rubber Culture in Mexico," I compiled all the information on the subject that I could obtain, supplementing it with the experience that I had acquired. Unfortunately, for reasons of a political nature, I had to abandon that plantation, and when the trees that I had planted grew large enough to yield rubber, they were tapped by the natives and entirely destroyed, but my work gave me an experience which I considered of great value.

The india-rubber trees that grow in Mexico are not the *Hævea guianensis* that grows in Brazil, but the *Castilloa elastica*, and if we have any of the *Hævea guianensis* I have not seen them.

Enough has been written lately on rubber cultivation to show that the profits, in Mexico at least, would be very great; indeed, 300 per cent. on the capital invested is a possible return, after five years, from cultivating *Castilloa elastica* in that Republic. This is a return which provides plenty of margin for contingencies. Rubber-growing is no longer in the experimental stage, as witness the plantation of La Esmeralda, in Oaxaca, to which further reference is made below. Cultivated india-rubber plantations are few, for the reason that, in some degree like the coffee plant, the india-rubber tree requires a long period of continuous cultivation before making any return to the cultivator. Mexico affords excellent opportunities for the development of this admittedly profitable industry. On this point the authority of Sir Henry Nevil Dering, the British Minister to Mexico, who, in a recent report to the Foreign Office on the cultivation of india-rubber, says:—"The regions most favourable for the growth of this important, yet rarely cultivated, india-rubber tree are the plains of Pochutla, Oaxaca, and also along the banks of the Copalita River, where the tree is found in astonishing numbers. Few are the plantations of india-rubber trees existing in the Republic of Mexico. The principal one is La Esmeralda, in Juquila, Oaxaca, which has over 200,000 trees eight years old." According to the same report the total expense for five years cultivation of a "rubber plantation of 100,000 trees will not exceed $25,000 in silver, and the yield of 100,000 trees at the first year's harvest will bring the planter $120,000, besides the product obtained from the corn, vanilla beans, cacao, and bananas raised from side planting. The net profit on the investment, after deducting the entire cost of the land and all expenses up to the first year of harvests, will be $95,000, and each of the succeeding harvests, for twenty-five or thirty years, will bring a steady income of over $100,000." This is 400 per cent. per annum net profit on the investment. These calculations are based upon the production of a five-year old tree, but the report adds that "this product will be gradually increased every year for the next four or five years."

Leaving aside the wonderful estimate of profits—and neither Sir Henry Dering nor Mr. Romero gives much practical information as to labour to back it up,—we would observe that the favourite rubber is that so well spoken of by Mr. Hart in Trinidad (as quoted by us the other day) and which for several years received a good deal of attention from Dr. Trimen in his annual reports, although the growth and yield of milk did not answer his expectations. the situation was not favourable to either. We should like if any trees of this kind (Panama rubber) have been trie Kalutara or Ratnapura districts and with what results. I must close for to-day.

DISTRICT ASSOCIATIONS.

SHEVAROY.

PROCEEDINGS of the monthly Committee Meeting of the S Planters' Association held in the Victoria Rooms, Yerc Monday, the 4th July, 1898, at 11 A.M.

PRESENT.—Mr. C. Rahm, Mr. Thurston Short, Rev. M. A Mr. C. G. Lechler (*Chairman*), Mr. R. Gompertz (*H Secretary*).

Read letter from Mr. Thurston Short *re* Chembana Resolved that it be brought before the General Meetin presently held.

Read part of the correspondence *re* lady-birds, when the H Secretary stated that as Mr. Newport was now at Yercaud, invited him to attend the General Meeting at 1 P.M. Resolv the matter be discussed at the General Meeting.

Read and *Recorded* the following letters:—

1. Letter from Postmaster-General, stating that Mail tra Madras stops at Kadiampatti and that the one to Madras stop there.

2. Letter from the Secretary, U.P.A.S.I., requesting to be i as to what progress has been made with reference to the su cashing *currency notes*, etc.

3. Circular from the Secretary, U.P.A.S.I., suggesti the Committee Meeting be at 10-30 A.M. and General Me 2 P.M. on Monday, 1st August, 1898.

4. Circular from the Secretary informing that the Meeting will open at Bangalore on Monday, 8th August, 1 the Committee Meeting at 10-30 A.M. on that day.

(Signed) C. G. LECHLER, *Chairman.*
(„) ROBERT GOMPERTZ, *Hony. Secretary,*

PROCEEDINGS of the Quarterly General Meeting of the S Planters' Association held in the Victoria Rooms, Yerc Monday, the 4th July, 1898, at 1 P.M.

PRESENT.—Mr. W. J. Lechler, Mr. Thurston Short, Mr. S bell, Mr. C. Dickins, Rev. M. Andersen, Mr. C. G. Lechler (*Ch* Mr. J. C. Large, Mr. F. Short, Mr. C. Rahm, Mr. E. Dick H. Newport, Mr. R. Gompertz (*Honorary Secretary*).

1. The notice calling the Meeting was taken as read.

2. It having been brought to the notice of the Meeting Accountant-General refused to issue supply bills except fo or multiples of Rs.500, it was resolved that the Honorary S be requested to address him on the subject and to enquire limitation had been fixed since it was not mentioned in th spondence.

3. *Read* letter from Mr. Thurston Short requesting the tion to ask the Collector for a grant of Rs.200 to put the N Chembanat Road in order and for a yearly grant for its main Resolved that Mr. Thurston Short be requested to write to H Secretary stating how much the Nagalore Planters are w subscribe to both items, and that the Honorary Secretary address the Collector on the subject.

4. *Resolved* that Mr. Lechler be elected as the Delegate t sent the Association, with Honorary Secretary, at the Mee the U.P.A.S.I. on the 8th proximo.

5. Mr. C. Dickins was elected Member of Committ Mr. Evans, who has proceeded to England.

(Signed) C. G. LECHLER, *Chairman.*
(„) ROBERT GOMPERTZ, *Hon. Secretary*

HELPLESS ON THE SHOALS.

A GREAT steamship, feeling her way in a fog, ran upon a l bank and stuck fast, about twenty miles from her port. She board a valuable cargo and nearly three hundred passenger of whom were almost within sight of their homes. The tug and tried vainly to pull her into deep water. The officers

e navigators as there had ever been. But she was helpless, and as dead low water. Only one thing could be done—to wait. A hours later the Captain said to his passengers, "*the tide is rising*; shall be off presently." Sixty minutes more and the ship floated. was now noon. At two o'clock sharp the impatient voyagers oped ashore. They might have been delayed longer save for the fact which the captain had announced in four words.

Perhaps this simple and not uncommon incident may contain a on for you and me. Suppose we draw a little comparison and The man who learns nothing from things at his elbow will waste his time going to college.

Mr. William Jordan is grocer and postmaster at Bright Waltham, ntage, Berks, where everybody knows him and believes in him. December 7th, 1893, he wrote a letter to a friend, and by consent both parties we print a part of it.

"In the autumn of 1890," he says, "I had an attack of influenza. e effects of it lingered with me. I had no heart for anything. I tired, languid, and weary. My appetite fell away, and what I eat gave me a sense of tightness and fulness at the chest; my vels were very costive, and I suffered much from sick headache. arp pains often caught me between the shoulders, and my breath- was very bad. I kept on with my work, but, on account of my kness, the task was doubly hard. For about four months I was e this, when one day the thought came to me to try a medicine t so many of my customers bought of me and spoke so highly of. arried out this idea, and after I had taken one bottle of it I iced this first of all—*My appetite was better.* I could eat; I ished my food; I got stronger. I took another bottle, and was well as ever. That is three years ago, and I haven't had a touch llness since. (Signed) William Jordan."

One more letter—short and right straight to the point. Mr. lliam R. Saunders writes it. He is a newsagent, and lives at Old wn, Wotton-under-Edge, Gloucestershire. His letter is dated vember 7th, 1893, just one month to a day earlier than Mr. rdan's. That merely happens so, the two gentlemen having no owledge of each other.

"In the spring of 1891," says Mr. Saunders, "I found myself out sorts all unexpectedly. I couldn't fancy what had come over me. was low, weak, and tired. I could eat hardly anything, and what id eat gave me so much pain and distress that I came to dread ting down to a meal. There were pains in my chest, sides, and ck, between the shoulder blades. Then I got so weak that my rk was a sort of drag on my hands; and even when walking I was short of breath I had to stop and rest here and there. I took dicines the doctor gave me, and pills, &c., that my friends recom- nded; but it was no use, they didn't help me. And all the time, nth after month, I was getting weaker and weaker. At last I t a bottle of medicine from Bristol that was right. That one ttle had this effect at first. *My appetite came back*, and when I t through with the second bottle I was completely cured. igned) William Saunders."

Now for the lesson. You see what it is, of course, but let's have in words. When the ship was fast on the shoal, only one thing lped her—*the rising tide.*

When these two men were fast on the shoal of illness only one ing helped them—*the rising appetite.* With eating and digestion me strength and health, for the trouble was that universal des- oyer and deceiver, indigestion and dyspepsia.

The *tide* rose to the pull of the moon. The languid *appetite* is used by medicine finally resorted to by both our correspondents—other Seigel's Curative Syrup.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (July 1, 1898) says:—

The supplies in Public sale have been on a much smaller scale this week d were mostly disposed of at about previous rates.

Only 280 bags East India were catalogued and these meeting no com- tition had to be bought in.

A slightly better tone prevailed for Central American kinds, and the oderate quantities offered realised rather better prices.

Futures have been a dull market with very little business passing and otations are practically unchanged on the week.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending June 29th, 1898, says:—Bank rate 3°/₀. Bombay Exchange closes at 1s. $3\frac{2}{32}$d. Brazil Exchange $7\frac{9}{16}$d. Rupee paper $3\frac{1}{2}$ °/₀ $62\frac{1}{2}$. Silver $27\frac{5}{16}$d. per oz.

The spot market has been steady at the recently established decline, but there is very little business doing, and only part of the very much smaller supplies have been sold. The few lots of colory continue to meet with good competition.

Brazil markets are very dull.

Daily receipts averaged 3,700 bags in Rio, and 7,000 bags in Santos.

Futures are dull and lifeless, closing values showing a decline of about 3d per cwt., viz.:—Good average Santos in Havre, September delivery, fcs. 36.25, in Hamburg pf. 30, and No. 7 low ordinary Rio in New York $5·65.

To-day's London official quotations are:—

	July	Sept.	Dec., '98.	Mar.	May, '99.

Please post your next reports to reach Madras on Friday, the 5th August, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Polli Betta, *26th July.—Weather.*—Complete change since 20th instant. Much more monsoonish. Completely overcast and rainy. Over an inch yesterday, and very wet to-day. *Crops.*—More sanguine now than ever before that estimates will be slightly exceeded. *Plant-diseases.*—Borer has been "mortial" bad, but otherwise coffee is looking very fine. *Labour.*—Estates are fairly off for labour, and all reasonable works are well in hand. Work on paddy-fields belated owing to deficiency of rain. *Health.*—Good.

Nellampatty (British).

27th July.—Weather.—As I said in my last, a change of weather in no mistake has set in, and we have had pucka monsoon at last. The wind has been something terrific, and in my experience have never seen it so bad. Rain for week 16 in., to date 63·36. *Plant-diseases.*—Leaf-disease in nursery very bad. No signs of it in clearings here yet. Throughout the district it is getting worse, I hear, and shortly it will be in full attack. *General Health.*—Still very bad. It is to be hoped this change of weather will improve things. *Interesting Items.*—One of our number has fallen a victim to this truly "delightful" climate. Mr. E. Jones died in Madras on 16th instant of pneumonia. Much sympathy is felt for his wife and family.

THE LADY-BIRD QUESTION.

The interesting report lately submitted by Mr. Howard Newport shows that his efforts to import lady-birds, as the natural exterminator of certain scale pests, were successful to a certain point. At that point they broke down most lamentably, and the next result was Failure—written with a

very large F. Still, the matter can hardly rest here, so it may be interesting to consider *why* the first scheme collapsed, and what precautions should be added in the next venture to the many taken by Mr. NEWPORT during the first attempt. In the first place, referring to the doubts expressed by the Kew Gardens authorities, we may remark that we believe Mr. NEWPORT'S plans were so laid that there was very little fear of his importing the wrong varieties of lady-birds. It is now generally admitted that these insects do prey on the scale pests that attack coffee, tea and fruit trees. There may be certain varieties that take a special delight in destroying the special pests that attack tea, others that prefer coffee pests, and so on. That the homœopathic system of fighting insects with insects is sound, has, however, been established beyond question. We republish on another page an interesting article from the *Sydney Mail* on this subject, and from it and from reports that have been previously submitted from other quarters, our readers may safely draw the conclusion that artificial methods, such as the use of sprays, are inferior to the natural method of destroying scale pests. The aim of the planter should be, therefore, to find the natural enemy or enemies of the pest that causes his crops to wither, and then to have it or them imported and placed in position for the attack. This raises the question as to the *practicability* of importing lady-birds, what have been proved to be destructive of red spider. Mr. NEWPORT considered this practicable, but at the first glance his failure may be taken to demonstrate his error. Looking at his report more closely, however, we satisfy ourselves that Mr. NEWPORT did import live lady-birds ; he conveyed them —perhaps not the whole of his collection, but still a good portion—to his estate *alive*. The state in which they were when the cases were opened proves that they were *alive at that time*. Where the whole scheme broke down most miserably was that no one was present who had had experience in thawing out torpid insects. No special preparations would appear to have been made, and when Father SOL declared his inability to carry the work out satisfactorily, the doom of the lady-birds was sealed. No doubt the difficulties Mr. NEWPORT met with in respect to the keeping of his charges at an even temperature may have had a good deal to do with his inability to thaw them out ; but insects that arrived in the condition he describes were not dead, and if there was life in them, there was always a chance of resuscitating in them.

If this conclusion is correct, it follows that another attempt to import lady-birds should certainly be made. But, first, information ought to be acquired as to the very best means of rendering them torpid by reduction of temperature, and next as to the proper method of restoring warmth and vigour to them on their arrival in this country. Mr. NEWPORT found a man in Brisbane who was competent to give him good advice on the former point. There were probably others who had had experience in respect to the second. In England, at any rate, there must be many scientific men who have studied the matter, and some who have had practical experience. An attempt should be made without delay to ascertain the names of such men, and to elicit from them any information that they can give that would guide importers of lady-birds into India when the time comes for thawing the next batch of insects out. It is evident from Mr. NEWPORT'S report that arrangements could easily be made at Brisbane for the despatch of another lot. All ship captains are not so disobligin Mr. NEWPORT'S experience might lead one to suppose. T should be no difficulty in making arrangements for shipment to receive careful attention on the voyage. T shipment at Colombo could be effected without any great risk, and at a small expense. The real difficulty commence on the arrival of the insects at their destina Unless by that time the right process is known and right appliances ready on the spot, there will probabl a repetition of the first collapse, and again we shall ha batch of dead lady-birds dumped down on a South In estate.

Might not the U.P.A.S.I. take action, in anticipatio a fresh attempt, to import these insects ? We refer a to the extract, "Fighting Pests with Parasites," give another page. It will be seen from this that "the cot cushion scale" gave immense trouble. Now mark what lows :—"All artificial methods of combating the pest w unavailing. At last it was suggested that, inasmuc the scale had been brought *from Australia*, where it w native and not a pest, there must be some natural para which kept it in check. Upon this suggestion action taken, and the now famous *Vedalia cardinalis* was in duced." Surely the words italicised justify the deduc that the *Vedalia cardinalis* was introduced *from Austra* And if so, why should not *coccinellidæ* be introduced India from Australia? It would obviously be of great inte to South Indian planters at the present juncture to k exactly how the above parasites were successfully impor The season at which they were collected, the metho packing and transport, and the whole procedure up to time of arrival on the field of action in California sh be ascertained. There should be no difficulty about this. is a mere question of time, for the State agricultural aut ities in California will have the whole thing at their fin ends and their willingness to impart information of kind is well known. In California, as in Madras, the S aided the enterprise. The two attempts would appea have been similar in character. The one failed, the o succeeded. We cannot but think that all this points in direction. It constitutes a finger-post, declaring that " California" is the road that should now be taken by those want information regarding methods of importing lady-b for the purpose of combating insect pests. But the se after knowledge need not take the road himself. He conduct his studies by correspondence—in the most appro modern fashion.

NOTES.

American Market Fund. The contributions to the Am can Tea Market Fund, India, reached over Rs.70,750 by the 6th ultimo.

To learn botany. A correspondent wishes to kn from one who has tried it, the way of teaching himself botany, that is to say, to l how to distinguish plants of the different genera species. We can only advise the querist to study plants in his compound with the help of a text-book, perhaps one of our readers may help him further in acquisition of this most technical of all sciences.

Vitality of rubber seed.

In the Annual Report of the Botanical Gardens, Singapore, for 1897, Mr. H. N. Ridley says that Para rubber seeds should be planted as soon as they are ripe, as they retain their vitality for only about a fortnight. This is important to those ordering Para rubber seeds. Oily seeds have a tendency to deteriorate early, but a fortnight is, indeed, a very short time, and may account for failures in the germinating of the seeds often reported to us.

The Journal of the R.A.S.E.

The second quarterly volume of the Royal Agricultural Society Journal for this year contains no articles of especial interest to our readers. The principal articles are by Professor Worthey Axes on the "Mare and Foal"; "The Marketing of Poultry" by Mr. Edward Brown; the first part of a series on Flower and Fruit-Farming in England by Professor J. McFadyean; and lastly, a long and technical paper on the growth of Sugar Beet and the manufacture of Sugar in the United Kingdom by Sir John Lawes and Sir Henry Gilbert.

The American War tax on tea.

The New York correspondent of the *Grocer* says: "The market advanced from 5 to 7 cents per pound. It is thought that the result will be to settle the market about 6 cents above its recent level. The growers will share part of the tax; the dealers will relinquish a part of their profits, and so will the retailers, while the consumers will scarcely realise that there is any tax on tea. I do not imagine that there will be a pound less imported and used on account of the duty. It ought to increase the demand for Ceylon and Indian tea, as these sorts yield a greater quantity of beverage than is obtained from a like quantity of China or Japan tea. The low grades are most affected by the duty. Political motives blocked every attempt to impose a duty on coffee, and yet coffee could stand a tax better than almost any other article imported, except sugar."

Ceylon Planters and the Emperor of Austria.

The Vienna correspondent of the *Times* says, *apropos* of the tea sent to the Austrian Emperor by Ceylon planters, "A British colonial present—namely, that of the Planters' Association of Ceylon, which has just reached Vienna, will certainly not be the least interesting of those made on the occasion of the Austrian Imperial Jubilee. It consists of an album of Ceylon views and twenty boxes constructed of ten different kinds of timber grown in Ceylon, containing a quantity of the finest varieties of native tea. The album, which is of English workmanship, is bound in crocodile leather with silver mountings. The Austrian arms appear in high relief on the cover. The whole forms a very creditable specimen of modern applied art. The bearer, Mr. G. Marinitch, himself an Austrian, has been received in audience by the Emperor, who graciously expressed his pleasure in accepting this present."

The re-opening of the Mints.

Writing in the *National Review*, Mr. Robert H. Elliott, of Mysore, expresses his views on the Currency question. He advocates a currency that will place India on an equal footing with the other silver-using countries whose productions compete with those of India. This end can, he thinks, only be reached by gradually re-opening the mints to the coinage of silver; and he suggests that Indian finances must be aided, and the condition of the country improved, by the grant of a British guarantee for all the existing and all the future liabilities of India, while the losses in exchange to the Government must be recouped by *import* duties and other forms of taxation. From this it will be seen that Mr. Elliott's views are widely different from those expressed in the U.P.A.S.I. Circular of 31st January last. What he advocates is neither more nor less than Protection in a very strong form: a low Exchange, which means a heavy tax on imports, and then import duties to add to this! What will the Manchester School say?

Nitrate of Potash.

With reference to the interest now taken in this valuable fertilizer, the following notes may be found useful. In its pure form, it consists of 53·41 parts of nitric acid and 46·59 of potash, which is equivalent to 13·8 of nitrogen. The commercial form, however, only contains from 12 to 13 per cent. "It is obtained, in large sheds built for that purpose, by the decomposition of animal matter mixed with a clayey or marley soil, which is then washed to extract the nitre. For a long time this salt was obtained from waste building materials. It is now made by decomposing potassi chloride by means of sodic nitrate, sodic chloride (sea-salt) and potassic chloride are obtained at the same time, but they are easily separated by crystallisation. Of all the products that contain potash, potassic nitrate is the most suitable for agricultural purposes."

"Potassic nitrate is one of the most efficacious agents in the growth of plants. It contains nitrogen and potash in a very assimilable form, and for certain plants, such as tobacco, it is the most suitable in many respects."

As its purity is frequently engendered both by careless preparation and by subsequent fraudulent adulteration with chlorides and alkaline sulphates, it is necessary that this product should be chemically analysed before purchase.

Hankow Teas.

The British Consul at Hankow does not take a cheerful view of the Chinese position, remarks the *H. & C. Mail.* He reports that in 1897 there was a very considerable falling off in the export of tea, amounting in all to 164,000 half-chests, equal to 10,168,000 lbs. from that port. The cause of this decrease in the export was mainly due to deterioration of quality in all grades except fine and finest. This deterioration is no new thing, but has now proceeded steadily for years, with the result that the demand for China teas grows steadily less, while that for Indian and Ceylon increases in the most marked manner. It is difficult, the report continues, to see how Hankow teas can ever again successfully compete with Indian and Ceylon, even under the most favourable circumstances. The Indian and Ceylon tea companies have a large capital at their command, and they are controlled and directed by business men who have a practical knowledge of tea planting. In consequence of late years there has been a concentration of management and an introduction of sundry economies in working; the trade has likewise benefited in no inconsiderable degree

from increased facilities of transport and reduced rates of freight. In the case of Indian teas the profit per lb. made on teas sold averages 2 2-10*d.* The average profit on Hankow tea is estimated at about ½*d.* per lb., and it is evident that in the event of any serious competition between Indian and Hankow teas the latter could be driven out of the market, while the former would still fetch a handsome profit. There is now no demand for Hankow teas in London, except for such chops as can be laid down at not over 5*d.* per lb., and at this price decent sound teas are expected. The shipment to London of medium and fine teas at from 8*d.* per lb. is a speculation depending entirely on the Continental demand.

London market.

Coffee.—The market has continued in the same dull condition, and importers have wisely refrained from pressing forward supplies at the same rate that they were doing during the early part of the month. The total brought to auction has consisted of less than usual at this time of year, and has been almost exclusively Guatemala and other Central American sorts. On Tuesday about 4,000 bags of Costa Rica were offered, but these were, with hardly an exception, of such common quality that the home trade paid little attention to them, and they were mostly sold for export at the recently established decline, or in some instances rather dearer. In the terminal market there has been no change. there being a general desire to wait for the new crop, The old crop, the receipts of which closed on Thursday, has produced nearly 10½ million bags, but as an indication of the enormous increase in consumption, it is pointed out that the stocks remaining in Rio and Santos are only about 100,000 bags more than last year.

Indian Teas.—With a poor selection on offer, and a moderate demand, the market has been irregular and in several cases easier. The new teas brought forward, with few exceptions, were not of very desirable character, consequently the demand was inactive and values mostly favoured buyers. The report of the crop so far continues disappointing, as not only is there likely to be a falling off in quantity, owing to the unfavourable weather, but the teas up to the present seem to be of very ordinary quality. This may be changed later on, but it appears almost certain that the crop will be considerably below the early estimate, as in some districts less than half the quantity has been manufactured up to date, as compared with last year, and it seems doubtful whether the deficiency will be made up. What the trade require is a good supply of medium and finer grades and less of the common kinds, and if growers would give more attention to trade requirements in this respect, it would be conducive to their interests. public sales 10,467 packages were brought forward of which were new season's, representing most of districts. Some of the Darjeelings were of fairl quality and readily sold, while the poor liquorin fetched about last week's rates. Other growth generally inferior and brought irregular and, in mos lower prices.

The Madras Agri-Horticultural Society.

The yearly report of this contains, as usual, some inte matter. Experimental cult does not seem to be in a very brisk state, only two being sent out, one to Mr. L. W. Grey, Pykara, N and the other to Mr. T. Thompson, Sanivarsante, C

As usual the most interesting correspondence furnished by that indefatigable horticulturist, Mr Ferguson, of Calicut. Writing on rubber, Mr. Fe on the 5th January, states :—

I am anxious to propagate plants of Castilloa elastica American rubber from cuttings, as my trees seldom or ever s I have never been able to save any seed from these trees w Heveas, Para rubber, seeds freely.

When these rubbers were first introduced here, I under experiment on the best plan of propagating the plants rapid cuttings, but I failed.

The late Mr. Lawson, at the request of Government, ca to look into this matter and to advise me on the subject, opinion being that we could not propagate by cuttings ex having a propagating house with bottom heat: but this Mr. stated was unnecessary: he spent several days with me h planted many hundreds of cuttings of the Castilloa in sm in much the same manner as I had previously done. I t greatest personal care of the cuttings, but all died, not one had formed a callus, and an expenditure of Rs.784 and muc able time were lost, as Government would not sanction my a small propagating house with hot-bed to start the cuttings

If you can give me any suggestion or information in this tion, I will be greatly obliged.

In the case of planting cuttings here, it appears to me th drawn up and no callus is formed. I find this with ro many other plants, but I think the use of bottom heat wou come this difficulty. If so, what would be the best form o ing bottom heat here or in Wynaad for propagating purp stove or a hot bed? And with a suitable propagating hous trained man to attend to it, could the work be carried o seasons of the year?

Mr. Ferguson has been asked to send some cutti Castilloa elastica. They will be tried in the garde and the results communicated to him.

On Durian, the Secretary of the M. A. H. Society s We sent six Durian plants to Mr. T. J. Ferguson of on the 5th December, 1889. In answer to our quer how they are getting on at the present time, he rep follows :—

I am sorry to say my Durian tree is not a success: alth has a certain amount of shade from large mango trees amon it is planted, the upper branches die back every hot weathe tree is now only eight feet high and many of the branches a I have come to the conclusion that the Durian and Mangost quite unsuitable for the West Coast. The Mangosteen gro at Courtallam and Burliar; possibly the Durian might grow the same localities, but neither are a success here.

Read letter from the Honorary Secretary, Tena Agri-Horticultural Society, Moulmein, dated 26th Ja 1898, in which he says: "In reply to yours of th instant." The Durian fruits well at Moulmein an quantities of the fruit are exported to Rangoon.

Read letter from the Superintendent, Agri-Horticultural rdens, Rangoon, dated 4th February, 1898 :—

Owing to the situation of the Society's gardens (being low), rian does not thrive, but on the high ground in the suburb of s town there are many trees bearing fruit regularly every year. rge quantities of this fruit are grown near Moulmein and Tavoy l brought into the market for sale.

From the same report we excerpt a para. on Sisal Hemp:—

Sisal Hemp.—As the Society have now large stock of the new re plant (Agave rigida var. Sisalana) from Yucatan, Mexico, I nk it desirable that these plants should be tried in different parts he Presidency, and therefore propose to place them at the disposal Government. A small stock will be reserved for trial locally.

Read letter from Mr. J. M. Gleeson, Superintendent of the Gardens, ed 17th March, 1898, thanking the Honorary Secretary and the ntlemen of the Committee for the cheque of Rs.100 presented to n for his efforts during the late Flower Shows.

---

a and the Currency. The following is the full text of the letter, dated 24th June, 1898, dressed by Mr. E. Tye, Secretary of the London Branch, dian Tea Association, to Sir Henry Fowler, President of e Indian Currency Commission :—

"SIR,—This Association, representing the producers of tea India, is deeply interested in the solution of the questions w under the consideration of the Committee over which u preside, and I am directed to submit the following atement with reference to the action taken by the Governent of India in closing the mints to the free coinage of ver and raising the exchange value of the rupee to about . 4*d.*, and the effect of the same on the industry.

"(1) The Indian tea industry first began to be of importnce about 35 years ago, when the crop of tea amounted to bout 3,000,000 lbs. The crop of the past season was 51,000,000 lbs.

"(2) The great industry, which has been built up by the nterprise of our countrymen and now represents a capital over £20,000,000, has been the means of reclaiming rge tracts of waste land in the valleys of the Brahmaputra nd Surma and other districts in India, and besides giving mployment to several hundred Europeans, who, as Voluners, form a valuable addition to the defensive resources of he country, it provides for over 1,000,000 natives of India, ost of whom come from congested districts and have reatly benefited by the extension of tea cultivation.

"(3) The capital invested in tea property in India is rgely held by persons in the United Kingdom who were ncouraged to take up an industry initiated by the Governent of India, and have since been attracted by the comarative safety of an investment in a staple article of consumption, which has hitherto given them fair returns on their money.

"(4) The consumption of British-grown tea (Indian and Ceylon) in this country last year amounted to 215,000,000 lbs., or nearly 6 lbs. per head of the population, and the United Kingdom derived the large revenue of more than £3,500,000 from the heavy import duty, representing over 40 per cent. of its value, levied on the article.

"(5) The action taken by the Government of India in its endeavour to give an artificial value to the rupee as compared with the present value of its weight in silver places the growers of tea (as well as other producers) in India at a disadvantage in their competition with their rivals in other silver-using countries to the extent, if exchange be maintained at 1*s.* 4*d.*, of the equivalent of an export duty of over 30 per cent.

"(6) Tea cultivation involves a large expenditure of capital, extending over several years before the plant arrives at maturity, and if it ceased to be remunerative, the land, being generally unsuited for any other crop, would relapse into jungle, and the money sunk in it would be lost.

"(7) The effect of the present currency policy on the tea industry in India is already seen in diminished profits, as shown by the published accounts of various tea companies, and every penny added artificially to the value of the rupee will reduce the profits of the industry this year by £250,000. The distrust which has been created is also putting a stop to the further extension of tea cultivation in India, and will, it is feared, divert capital from India to China for the purpose of developing the tea industry in the latter country under European supervision, and with modern methods of cultivation and manufacture. The future of Indian and Ceylon teas will depend largely on their increased consumption in countries outside the United Kingdom, and the burden placed on them by the artificial value given to the rupee will put them at a serious disadvantage in competition with China tea.

"Without entering upon a lengthened criticism of the currency policy of the Government of India, I am to point out that the closure of the mints to the free coinage of silver has not established that fixity of exchange which was the avowed main reason for the adoption of the measure, nor provided for the Government the supply of gold required to render the introduction of an effective gold standard practicable, and although the exchange value of the rupee has been raised to a higher level, thereby reducing the loss by exchange on the Secretary of State's drafts, this saving has been obtained at the cost of producers in India, while the stringency produced in the money market imposes a heavy burden on trade, and threatens, if prolonged, to have disastrous effects on the industries of the country. The further proposals of the Government of India, as set forth in their despatch, dated the 3rd March, 1898, are framed so as to increase the stringency referred to, with the object of compelling an exchange of gold for rupees at the rate of 1*s.* 4*d.* per rupee, or higher. This is an attempt on the part of the Government to obtain gold below its value in silver at the expense of producers in India with the certainty of heavy, and possibly ruinous, loss to industries upon which India has to depend for the maintenance of the favourable balance of trade required to enable it to meet its foreign indebtedness.

"I am desired to say that all, or any of the following

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per on :—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from he parent trees of above analysis at Rs.6 per pound containing bout 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save om the

MANAGER, ARIENKOW ESTATE,
Shencottah.

gentlemen, who are members of the Association and have had extensive experience in connection with the Indian tea trade, will be prepared to attend as witnesses before the Committee whenever their evidence can be taken :—Mr. D. Cruickshank, Mr. R. B. Magor, Mr. J. N. Stuart and Mr. W. H. Verner."

LETTERS TO THE EDITOR.

FORKING ON LAND AS STEEP AS A ROOF.

SIR,—Some weeks ago a correspondent had some very confident notes on how to fork steep land. He went so far, indeed, as to declare he could safely fork land "as steep as the roof of a house" without fear of wash. Query, was the roof he had in his mind a corrugated iron one, or a thatched one? It makes just a little difference, you know. Anyway he might let us, poor outsiders, into the secrets of his methods, unless it's a case of "patent." Till then his assertions must remain like my land—

A TRIFLE STEEP.

"SIT-FAST."

SIR,—What "Via Palghat" terms a "*sit-fast*" is nothing more or less than a troublesome saddle gall. Many country-breds, especially those bred in the interior, are maltreated as colts, by being broken to saddle by the native method which has nothing to recommend it. If the "Chana" (native saddle) galls the pony on the bone *between* two joints, the animal escapes with a scar or white spot, but if *on* the joint itself, the bones get affected and a discharge given off, which collects over the part and throws up the covering skin in the form of a soft lump. It is very difficult in purchasing newly-trained (by native method) country-breds to know how the mischief lies, and only time will show. The following treatment will do good. First lance up the lump and keep the part well open. Poultice twice a day with linseed meal, adding a few drops of carbolic acid to the meal, till all pus and inflammation has been removed. Then use a solution of 1 to 15 of Cyona tincture (not stronger, as it will heal too quick), keep the place moist with the medicine, and allow the wound to heal gradually from the bottom. A fortnight should see the animal fit for use. A small lump will still be visible, but as it is only a bony growth, it will not interfere with the working of the pony. A high-padded saddle, raised well off the spine, and a small piece of lint sown on to the padding just above the gall, in case of accidents, should be used. Sanitas oil is another good remedy, but the manipulation of it needs a little skill and experience.

PLANTER VET.

GENERAL ARTICLES.

A CO-OPERATIVE SALTPETRE REFINERY.

WE publish below a further communication from "Toda" on this interesting subject. It is held with some truth that a little judicious opposition often does more to ensure the success of a scheme or venture than unqualified approval. So, while wishing "Toda" and his supporters—for we have already forwarded letters to him on the subject—all success, we have just a word or two to say on the letter beneath. Most of the sting of our criticism, however, will be taken out by our concluding paragraph. But to the point. In the absence of more exact information as to cost of plant, we may allow "Toda's" estimate to pass. As to the cost of manufacture, we are vouchsafed no information, and indeed are told that "this calculation does not enter into the question now." In all new undertakings, a certain amount of confidence is necessary, but surely this is carr ing it to excess. On the cost of production of a goo article depends the whole success of the undertaking, a though "Toda" may be absolutely correct in his convi tions, it will be difficult, I fancy, to communicate his co fidence to strangers. Had we nothing but "Toda's letters before us, we shonld certainly only reiterate t advice we have already given, to which he takes exceptio of exercising caution to our readers before taking up t scheme. Good commercial nitrate of potash usually co tains from 12 to 13 per cent. of nitrogen, being abo 2 per cent. under nitrate of soda. Presumably the expe sive article quoted by the Coast firms is up to this stan ard, but what we want to know is the composition country-made saltpetre, and whether the cost of produ tion is above or below the market price. In not a fe co-operative ventures, the result to the shareholders producing an article at cost price has proved unsatisfactor to say the least of it, being higher than the cost of t same article in the open market. It is idle to talk of co-operative refinery as not partaking of a commerci nature; its very essence is commercial: to produce for t benefit of the shareholders a certain article at a lower co than if purchased in the open market. It enters into dire competition with the trade, and must be run on sound co mercial principles if it is to be ever a success. We fe "Toda" will never forgive us for writing like this, b in all frankness our remarks are based on nothing save sincere desire to ensure the success of a scheme which m mean such a lot to the planting community. For it is n only in a saltpetre refinery that co-operation can be benefit; there are a hundred other directions where co bined effort would be invaluable.

Now for our concluding paragraph. It is this: that few years ago a planter experimented 'on his own' in saltpetre refinery and found it a great success. The initi outlay was only Rs.500, and he managed to secure an exce lent article at a cost of only fifty rupees a ton. The site the refinery in question was at Dindigul, and was on abandoned by reason of the planter parting with his inte ests in certain plantations in the adjoining district. W shall put "Toda" into communication with the gentlem in question if he desires, and meanwhile end with a hear wish of "Waes hael!" to the Planter's Refinery.

"Toda" writes to us :—

Kindly afford me space for a short reply to your Editorial the last issue of *Planting Opinion*, criticizing my letter with refe ence to the institution of a Co-operative Saltpetre Refinery. I a very pleased to see that my suggestion has your sympathy, a that "you are anxious to render it all the support you can."

You write, "The three main points that require to be settled wi some approach to accuracy are (i) the cost of erecting the necessa plant, (ii) the cost of the manufactured article, (iii) its manurial pr perties as determined by chemical analysis."

(i) *Cost of Plant.*—In my original letter I estimated the init outlay at (25 estates @ Rs.50 each) Rs.1,250. Of this, Rs.250 wou be required for erection of a building, purchase of iron pans, scal and weights, &c., and the balance, Rs.1,000, as advances to Opilig or crude saltpetre manufacturers. I know from experience what "refinery" is; and Rs.250 would certainly cover its cost.

(ii) *Cost of manufactured article.*—This could very easily be arriv at. It would be necessary first to ascertain the price paid now refiners for crude saltpetre, and then to note the exact yield refined saltpetre from a given weight of crude stuff, and the weig of fuel used in the process. But, in my view, this calculation do not enter into the question *now*. The primary object of the Refine

ve sketched would be to reduce the price of refined saltpetre to cribers; and whatever the cost of the manufactured article may that article would always be available to the owners of the nery at present market price *minus* the refiner's and retailer's ts. That the Refinery would achieve its object is beyond tion. It would of course be necessary to go into a careful lation of cost of manufacture, in order to fix the issue (or cost) to subscribers. But the "cost of manufactured article" need form any obstacle to the establishment of the Refinery.

) *Chemical Analysis.*—This is the most important point, because, he value of the outturn as manure, the success of the Refinery d hinge. I will have a chemical analysis of ordinary native- e saltpetre carried out as quickly as possible; but many yses must have been made already (as saltpetre is usually sold oast agents and others with a guarantee), and I would ask any- in possession of such analyses to publish them, stating if ible where the saltpetre was made. I may here point out that Refinery could outturn saltpetre of almost any required degree rity, the only extra cost being price of fuel consumed. If the lish method of refining were adopted, which is both simple and pensive, absolutely pure nitrate of potash could be manufactured. ou go on to say, "It is a sensible proverb that says 'make haste ly.' Saltpetre refineries, whether co-operative or not, are com- ial ventures, and it would be the height of folly to rush an ertaking of this kind." That *festina lente* is a sound maxim ite agree, and I was careful in my first letter to say, "There are y minor details which will have to be gone into; but of course scheme need not be elaborated until and unless I find the ssary funds forthcoming." But, to the latter part of the state- t I have quoted, I cannot subscribe. A co-operative refinery ed with the object of entering into competition with other eries, and of paying a dividend to shareholders, would unques- ably be a "commercial venture," but the Refinery I contem- e run on totally different lines. It would in no sense be nmercial," in that it would not in any way depend on 'com- cium,' or trading; though possibly, when started, any stock over above the requirements of subscribers might with advantage old to non-subscribers at market rates. But the fundamental ct of the Refinery I have sketched would be to supply its owners all the saltpetre they require at cost price, and it cannot there- be characterised as a trading concern at all. And how can it be d a "venture," when all element of risk is absent? On the rary, it would necessarily be an assured success from the very nning, because—whatever the price of saltpetre in the open ket—subscribers would be able to procure their supplies at a h lower rate. In other words, the owners of the Refinery would the large profits now pocketed by the native refiner and the t. A refinery run on the lines I have laid down would be in a different category from a "commercial venture." Its expressed ct would be fulfilled from the start; and I would rather call it a tain success."

FIGHTING PESTS WITH PARASITES.

HE greatest single industry of California is fruit-growing, says *Sydney Mail*, and the importance of this industry has led to the y of every method which would increase its profits or lessen its nses. In this studies that of economic entomology has taken a most place, for the most obdurate and expensive enemy the ardist has to combat is the myriad insect pests that attack him very point and lessen his profits on all sides.

he result of years of careful study and continuous fighting with ys and washes and gases is what may be called the California hod—that of fighting insects with insects– a sort of homœopathic edy of like curing like. Wherever insect pests have become ructive, efforts to find and introduce their natural parasites been made, and usually with good results. Artificial methods resorted to as a temporary expedient until better means could ad.

roughout all Nature there exists a perfect system of checks counter checks, and otherwise redundant life is kept down and balance preserved. It is this fact that the Californians endea- to take advantage of. The worst pests that are known there all imported varieties. They were brought into her borders n California, ambitious to become the garden of the Union, orted all varieties of plants from every part of the world. In very many cases they were destructive varieties of insects without their natural parasites. Removed from their natural enemies these pests increased with wonderful rapidity and became a threatening danger.

One of the worst of these was the now well-known cottony cushion scale (Icerya purchasi), which at one time threatened the total destruction of the orange orchards of the State. All artificial methods of combating this pest were unavailing. At last it was suggested that, inasmuch as the scale had been brought from Australia, where it was a native and not a pest, there must be some natural parasite which kept it in check. Upon this suggestion action was taken, and the now famous Vedalia cardinalis was introduced. The result of the labours of this one little parasite is that California will this year ship 12,000 cartloads of oranges, whereas she would have had none had it not been for its labours, for the shipments at one time fell to 600 cars, and scores of orchards were being cut down and burned.

The wonderful success of this importation of parasitic friends led to the further study of parasitism in insects, which was aided by the State, and large importations of parasitic insects have been made with varying but usually good results. In some cases parasites have been introduced with the scales themselves, and in these cases the spread of the pest has not been rapid. In other cases natural parasites have adapted themselves to new conditions, and attacked the imported insects. There are now very few scale insects in California which do not have some parasites. There are sections, however, in which the parasites have not got a foothold, and the pests increase rapidly, while in some cases the scale increases beyond the power of the parasite to keep it in check. But, as a rule, the effort to introduce and propagate beneficial insects has met with marked success. While artificial methods of fighting pests have still to be resorted to for some varieties and in some sections, these have been and are still being lessened, much to the benefit of the fruit-grower, by taking advantage of Nature's methods of keeping them in check.

THE WORK OF LADY-BIRDS.

REPORT OF PROF. ALBERT KOEBELE, ENTOMOLOGIST OF THE HAWAIIAN GOVERNMENT.

(Continued.)

Lecanium hesperidum, Linnæus, is but rarely found on the higher altitudes; it comes from the temperate zones.

Lecanium longulum, Douglas, is one of our commonest species and attacks most any plant on the islands. It was this species that caused the smutty appearance of the iron-wood trees in the park before the introduction of the Rhizobius beetle. It is found in the tropics only out of doors.

Lecanium mori, Signoret, is found also upon many plants in the islands, on various ferns, guava, etc.

Lecanium nigrum, Nietner, the commonest of all scale insects in the islands, nearly always can be found upon the Hibiscus hedges, Groton, guava, fig trees, etc. It was met with everywhere in the tropics, Fiji, New Caledonia, Queensland, Ceylon, Singapore, Hong Kong and Formosa. In Japan it cannot live out of doors, and is found only in green houses.

Lecanium oleæ, Bernard, is not found numerous in tropical countries, it is rarely met with in Honolulu, only in one instance have I seen it numerous upon oleander, on Hawaii.

Lecanium tessellatum, Signoret, another species found here and there, but not numerous as yet, it is more often attacked by internal parasites.

Pulvinaria momeæ, Maskell, and an unnamed species in Kona, are perhaps the only well established species aside from P. psidii mentioned above. It had first been found upon Mamea Americana, Linni, during January, 1894, but since then it was found on many trees in Honolulu, especially mango and fig. No parasite has been observed on the same, yet without any doubt the Cryptolæmus larvæ and those of the numerous species of Hyperaspis introduced from California and Japan will destroy its eggs. A fourth species of Pulvinaria was found at Honolulu upon newly introduced Potocarpus from Japan, where the insect is rather rare upon many trees, especially the camellia and magnolia.

Planchonia sp., so far but one specimen was found in Honolulu upon Jacaranda mimosifolia, Prosopis dulcis, Oleander, fig trees, etc., snd it is preyed upon by an internal Chacid parasite to such an extent that in some instances the scale has disappeared entirely from eome trees. Found at Hong Kong, China, upon fig tree and badly parasiteized. Eryococeus araucariæ, Maskell, is found on all the islands upon the various species of Araucaria; it comes from Australasia.

Of Dactylopius we have a great many species in the islands, but yet they are, with a few exceptions, not worked up. It is one of the most easily species to introduce, since many of them when full grown will often leave the plant and secrete themselves most anywhere to deposit their eggs, often on the roots, in any crevice or behind leaves on stem, etc., the most minute examination of plants could not reveal them.

Icerya purchasi, Maskell, is so far the only species present in the islands, I. Aegyptiaca, Douglas, and I. Seychellarum, Westwood, are found on many plants around Hong Kong and may be brought in at any time. The two lady-birds preying on those species in China, *viz.*, Rodalia fumida, Muls. and R. pumila, Weise, were introduced and no doubt are breeding upon I. purchasi, which, once so numerous, can now only be found after careful search.

The above comprise the principal coccids found in the islands, very many of them are preyed upon by internal parasites that were brought in with their host. Some of these are doing very beneficial work, often destroyiug a large percentage of the scales. Only in few instances were scale insects with internal parasites introduced by me, since there is more or less risk in doing so, it was considered the safest way to follow, only to send the numerous predatious insects found preying on the scales, and here we have the numerous lady-birds, some two hundred species of which had been introduced with more or less success. It seems that those introduced from the tropical countries, or such that are found in similar latitudes to that of the islands with a few degrees, have succeeded best to establish themselves; especially when the same coccid upon which they fed in their home was at hand, the increase was marvellous.

Aside from the parasites and predacious insects introduced, we have established two species of fungoids destructive to all the Lecanidæ, and these have since spread over most parts of the islands. A repeated trial with a third, Microcera coccophylla, that lives upon the expense of the various Diaspidinæ. has as yet not been so successful. Still I am confident of also establishing this very valuable agent to eradicate the scales. It was met with in New South Wales northward to Cairns, Queensland. It is present in Ceylon, China Formosa and even as far north as southern Japan, chiefly upon the various Aspidiotus and Mitilaspis, coccids that are always abundant where they occur, owing to their hard protective covering, the enemies preying upon the same have not the equal chance as those preying upon other scales.

At the present time, the most pernicious coccids, at least, have practically become harmless and will become still more so with the increase of their various enemies. I anticipate no danger to the vastly increasing coffee culture by scale insects still present, some of these will yet cause a little trouble to the citrus trees, but I am confident to overcome the same in the near future, as has been done in the past, not with artificial means, but with natural enemies, which, when once established, are an everlasting benefit to the country where introduced.

Of the introduced Coccinellidæ I will give a short account of some of them. To my knowledge, and that of Rev. Blackburn, who studied the insects on the islands some twenty years since, only three species of lady-birds were present. Those were Coccinella abdominalis, say, an American insect, and no doubt introduced at a very early date, since it has been known to the oldest residents. It feeds upon Lecanidæ and Aphids, is not a fast breeder, and since the introduction of other forms has become much less in numbers. The other two are small Scymnus, S. ocellatus, Sharp, and S. vividus, Sharp, the last at least, has repeatedly been found breeding upon plant lice. Owing to the large quantities of Coccinella repanta on the islands, none of the California forms that live upon plant lice have been observed as yet, save that one visitor on the dinner table in the club on Nov. 10th, viz., Coccinella Californica, Man., introduced two years since, yet we are safe to say, several species will turn time, if properly searched for. Chilochorus bivulnerus, Muls brought to the islands, in 1891, on my trip to Australia and t over to Mr. A. Jaeger, who liberated the same.

Again large quantities were sent to you during Dec., 1894, w other California forms. The insect was found breeding, both i and during the last summer, yet never numerous. This is one most numerous native lady-birds in California that feed upon v scale insects, and a higher altitude may be suitable for their in Sendings of these as all other forms will be made again various parts on the other islands direct. Hyperaspis were s you in several species, all of these feeding upon the various bugs (Dactylopius), then so numerous in Honolulu. You forwarded one of the beetles to me at Sydney, some ten m later, as breeding in Honolulu. This has been H. undulate, and I personally have not met with it since, owing no doubt enormous increase of other forms, and in consequence the sc of its food.

Large numbers of Scymnus were also forwarded to you strange to say one of the very rarest California species, S. d Lec., that had not been found again ever since being describe forty years ago, was met with in quantities while collecting bius upon Casuarina. The little beetle in California breeds Dactylopius, and very likely on the same in the islands, D. c laria, Maskell, on the sugarcane would be similar to that on in California.

Of the Australian forms we certainly have the most benefi all the lady-birds introduced. Of the Aphis feeding species, nella repanta, thumb, has done wonders in destroying all the v forms of lice on trees, shrubs and plants. It appears usually upon the orange plant louse; it has practically cleaned out th louse, and with it has cured the formerly so prevalent disease these plants, which decayed to a large extent in consequence myriads of plant lice present; and recently it has shown its a upon the newly appeared louse in the cane fields at Kauai, Oah Maui. It has spread within one year, after being distributed b over all parts of the islands, and was met with both on Hawa Maui as high up as timber will grow. How unfortunate, that such beneficial friends we should find a parasite destroying the to a large extent, yet such is the fact. Everywhere the beetles be found, apparently at rest on the leaves, yet under it and be its legs a small yellowish silken cocoon is found, from which time hatches a small black hymenopterous parasite, Centistes A cana, Riley, an insect found all over the world preying on aphid fe lady-birds. How long the parasite has been present on the isla hard to say. Undoubtedly it had been breeding upon Coccinella minalis many years. It had been found upon the same by M Miller and Wait at Kona before the introduction of other Cocci by me. Leis conformis, Boisd, had been observed breeding up orange Aphis early in 1894. Another very valuable lady-bird tha upon the various Aphids, and one that had always been fou small numbers only in Australia is Platyomus lividigaster, Mu It was met with in that country from New South Wales up to C Queensland, and chiefly upon the orange Aphis. It was also n that a larger percentage of their larva were destroyed by a pa and owing to this fact the comparative scarcity may be acco for. On the other hand, there is no such parasite as yet kno the islands, the beetle was never yet found destroyed by the tistes fly and in consequence may even prove of more value i than the Coccinella rapanta. Its dusky larva is unlike those Coccinella proper; it is covered all over with long spines for p tion. The rather small black beetle is nearly round and h sides of thorax bright sulphur yellow. It is a most active cre

Of Orcus, O. Chalybeus, Boisd, has increased most upon th ous Diaspidinæ chiefly, yet it will feed upon most any scale a as Asphids. The Cryptolæmus mountrouzieri, Mulsant, is opinion the most valuable lady-bird introduced into the island is always found upon any plant infested with mealy bug relentlessly follows up that destructive Pulvinaria and devou eggs. It likewise devours Eriococcus araucariæ, Maskell, inf the various Araucarias. You distributed the same during 189 on my recent inspection it was met with everywhere on a islands upon its fast disappearing food; around the Volcano,

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

he various forest trees and shrubs it was very numerous; from here down Pahala over the lava flows it was numerous; upon the canty bushes growing. In Kona it was met with up to an altitude of 6,000 feet, and here was simply swarming upon Myoporum sandvicene, Gray, infested with Lecanium fillicum, Boisduval, its larva feeding upon the Dactylopius present. On Maui it was found upwards to the timber line and is very likely even higher. That famed Vedalia cardinalis, Mulsant, did good work in Honolulu upon the one scale, Icerya purchasii, Maskell. The Cryptolæmus beetle did equally well upon about a dozen species of coccids. Many other enemies were introduced for the Icerya scale, and one of them at least, Novius Koebelei, is at present abundant.

Of Rhizobius a large number of species were introduced, and R. lentralis, Erichson, that feeds upon the various Lecanidæ, has become the most abundant. It will feed upon Pulvinaria as well and can at any time be found upon Araucaria trees, preying upon Icrioccus; owing to its valuable work, the numerous species of black scales are disappearing. At the Kapiolani Park the Casurina, formerly a complete black mass, owing to the numerous Lecanium longulum, Douglas, have entirely recovered from the blighty appearance, and both the beetles and larvæ could be found in any numbers during summer. Of the smaller Australian beetles, Cyreme nigellum Black burn, has perhaps increased most, and it was met with every where in Honolulu.

With the Ceylon Coccinellids nothing could be done, the distance is too great and all arrived at Honolulu dead. One of these, and certainly the most valuable found there, Chilochorus circumdatus, Gyllh., was later sent over from China. This insect had been recorded from Ceylon, India, and Sumatra, and consequently its occurrence around Hong Kong could be expected. During three months, Oct. to Dec., 1895, a careful search had been made in the neighbourhood of Hong Kong, and of the insects introduced many were breeding in the island.

Synonyche grandis, Thumberg, is the largest known lady-bird that feeds upon Oregma bambusæ, Buckton, infesting the various bambus plants in the Malay Archipelago, Ceylon, China and the southern Japan. A fresh specimen of these was found upon orange aphids in Honolulu on May 6, 1896, and may have bred here. Verania discolor, Fabr., found near Hong Kong and Swatow was again met with in Honolulu eleven months later; it feeds upon aphids. Coelophora pupillata, Swartz, found common near Hong Kong upon Celtis sinensis, infested with Psylla, was met with all summer upon Aphis at Honolulu.

Coelophora biplagiata, Swartz, collected and sent from Hong Kong, has been noticed in Honolulu for several months after my return. Chilomenes quartriplagiata, Swartz, had been observed feeding upon plant lice and Dactylopius and will prove a valuable addition. Cryptogonus orbiculatus, Gyllh, is a very common little lady-bird. It was found numerous upon orange, etc., at Atami, Japan, it was breeding by the thousands upon Mimosa pudica, L., infested with Dactylopius adonidum, Linn,—the common mealy bug,—at Conloong, China, and in Formosa again, it was numerous upon the tea plants that were infested with Chionaspis there. This will be another valuable help in destroying the various mealy bugs. The beetle was found very numerous during November at Honolulu.

(*To be concluded.*)

MAINTAINING THE FERTILITY OF THE SOIL.

As agriculture will doubtless always remain the basis of human industry, and as a prosperous system of agriculture can only be built upon a fertile soil, it is evident that the maintenance of the fertility of our farms is one of the most important of all economic problems. This subject has been usefully treated by Professor E. Thorne, Director of the Agricultural Station at Ohio.

That a soil may be speedily reduced in fertility under an improvident system of husbandry, and that the original richness of the once fertile land may be restored, although sometimes slowly and laboriously, are matters of common observation. The author states that his recollection goes back to within half a century of the first settlement of the white man in that part of Ohio where he was born; and he can recall old districts which had been thrown out of cultivation as exhausted, and permitted to grow up in weeds and briars, while new fields were laboriously hewn from the forest; but as the pressure for land became more intense, these old worn-out lands were again brought under the plough, and, with a more enlightened system of farming have been made to produce crops equal to those yielded by virgin soils. The history of British agriculture furnishes a most valuable object-lesson on this point. We find that at the close of the thirteenth century the average yield of wheat in England was from ten to fifteen bushels per acre. At the end of the seventeenth century the average yield on the well-tilled and manured lands was twenty bushels per acre. In 1771 Arthur Young estimated the average yield of wheat at three-quarters or twenty-four bushels, while the following table shows the average yield of wheat per acre over each eight yearly periods from 1852, and over the forty years 1852—1891 reckoned in bushels of 60 lb. weight. Average yield of wheat per acre in the United Kingdom:

8 years,	1852–59	...	$28\frac{3}{8}$ bushels
8 „	1860–67	...	$28\frac{1}{8}$ „
8 „	1868–75	...	$27\frac{1}{8}$ „
8 „	1876–83	...	$25\frac{1}{4}$ „
8 „	1884–91	...	$29\frac{7}{8}$ „
40 „	1852–91	...	$27\frac{7}{8}$ „

The date shows that the range is from about twenty-five bushels to thirty bushels, with an average yield over the forty years of nearly twenty-eight bushels per acre.

The increase of wheat per acre in this country for the last five and-a-half centuries may therefore be ascribed altogether to better husbandry, including better tillage, better drainage, and a more extended use of the manure made on the farm, for it is only within a comparatively recent period that the use of commercial fertilisers has played any important part in British agriculture. Indeed, it was rare even twenty-five years ago to hear such fertilisers spoken of otherwise than unfavourably.

Wherever good cultivation has been adopted and the natural sources of fertility systematically provided for and made use of, there has been no decline in the productiveness of the soil; and lands which have been under culture for very many centuries are still yielding harvests equal to, or better, than those soils freshly brought under the plough. These facts abundantly prove that the maintenance of fertility in a soil is thoroughly practicable.

The real point of issue, therefore, is to learn to what extent we may call to our aid the discoveries of modern science in reducing the cost of, and making more effective the empirial methods of our forefathers, or whether we may substitute for those methods others yet more effective.

While the farmer may have been disappointed in the expectation raised by the discoveries of the earlier chemists, that chemical analysis was to be the X ray which should reveal clearly and definitely the plant producing capacity of a given soil, and the food requirements of a particular plant or crop, yet it must be conceded that chemistry has done much for the farmer and horticulturist in both these directions, and as we learn to read the revelations of chemistry by the assisting lights of geology and biology, we are slowly and laboriously, but surely, working out the problems of plant nutrition, and it now seems safe to formulate a few general principles as being sufficiently established to justify building upon them a scheme of farm or horticultural management.

(1) The carbon of green-leaved plants is absorbed directly and practically exclusively from the atmosphere, through the medium of the foliage. At least, the soil supply of carbon is a matter of minor importance.

(2) The oxygen of such plants is chiefly absorbed in like manner by the foliage, or taken up by the roots in combination with hydrogen, in the form of water, although a minor and comparatively unimportant source of oxygen and hydrogen may be found in the breaking up of nitrates and ammonia existing in the soil.

(3) The nitrogen of green-leaved plants is obtained invariably from the soil, either directly, or from compounds of nitrogen with oxygen, hydrogen, or mineral, or organic compounds such as nitric acid, ammonia, nitric and humes: or indirectly through symbiotic growth of micro-organism living in the soil which have the power of assimilating the free nitrogen of the atmosphere. This symbiotic growth being apparently confined almort exclusively to leguminous plants, such as the clovers, beans, peas, Lucerne, sainfoin, &c.

(4) The mineral constituents of plants are taken directly from the soil, being absorbed by the roots in the form of solution in water.

(5) The ten or more mineral elements found in the ash of plants when burnt will be furnished in abundance by practically all fertile soils, provided there be present a sufficient quantity of available potash and phosphoric acid, and sometime also of lime.

(6) The various elementary substances found in plants are combined with each other in certain definite proportions varying in different species, but held within very narrow limits for each species. The growth of plants is measured and limited by the least abundant of the various elements required for their nutrition.

Reducing these principles to a practical form, we may say that the plant will secure a full supply of carbon provided other nutrients are furnished; that the supply of oxygen and hydrogen is chiefly dependent upon the water supply, that the amount of nitrogen may be regulated by the use of mineral nitrates or ammonia salts, or the setting up in the soil of those conditions which favour the growth of nitrogen-working micro-organisms, and that having provided a full nitrogen supply, we may control the growth of the plant by giving or withholding phosphoric acid and potash.

The water-supply of plants is a matter of supreme importance, for not only does water comprise three-fourths or more of the actual weight of cultivated plants when growing, but it is the vehicle in which all the mineral and nitrogenous constituents of plant food are carried to their destination.

In performance of this function it is constantly passing through the plant, being absorbed by the roots and transpired by the foliage, it being estimated that more than 3000 lb. of water must pass through the plant for the deposition of a single pound of dry substance in the plant, and thus the question of the water-supply by irrigation in arid region and by tillage and drainage in all localities becomes one which cannot be neglected. The nitrogen supply takes rank next to that of water in importance, for it is this constituent which may be most quickly exhausted by an improvident course of cropping, and which is the most expensive to replace by artificial methods.

In our artificial manure markets the price demanded for a pound of nitrogen 8*d.* to 1*s.* or more—two to four times as much as is asked for a pound of phosphoric acid or potash and as nitrogen is found in larger quantity in most cultivated plants than is phosphoric acid and sometimes even larger than is the constituent potash, it will be seen that the cost of providing this element of plant food in artificial fertiliser must be a serious and expensive matter.

When it is considered that the plant food in the soil must be of very slow solubility in order that it may not at once be washed away by heavy rains, and when we reflect upon the observed fact that when certain forms of soluble plant food are applied, such as superphosphates, for instance a large part of it is immediately converted into an insoluble or very slowly soluble condition by reactions within the soil, it it can readily be understood that it is impossible to realise in the growth of a single season, or even in many seasous the entire quantity of plant food applied in manure.

But accepting the fact which seems to be demonstrated beyond question that the entire amount of plant food applied in a fertiliser will not be returned in the crop, the question arises, especially in view of the light which recent discoveries have thrown upon the methods by which the inert nitrogen of the soil is converted into assimilable form through the agency of nitrifying organisms, and upon the still more interesting problem of the assimilation of free nitrogen through the agency of symbiotic growth, may the farmer not hope to be able to dispense—to a large extent at all events—with purchased nitrogen, and accomplish the end in view by the growth of leguminous crops and the addition of phosphoric acid and potash only?

The experimental answer to this question involves the culture of crops in rotation, and of all the work, the world over, bearing upon this subject that in Agdell Field, at Rothamsted, under the management of Sir John Lawes and Sir Henry Gilbert, which has been under experimental investigation since the year 1848, is the most complete.—J. J. W. in the *Field*.

PRODUCTS AND RESOURCES OF THE PHILIPPINE ISLANDS.

THE great commercial products of the Philippine Archipelago are sugar, hemp, tobacco, copra and coffee, and their importance, as articles of export, are in the order given.

The production of sugar has increased rapidly. In 1871 it less than 100,000 tons; in 1881, 230,000 tons; in 1893, 261,686 t and it was then increasing at the rate of 15,000 tons per y About one-third of the total production is from the provinc Pampanga, in the central area of Luzon, and nearly north of Ma The provinces about Manila Bay and the one north of Pampang also large producers. This sugar is exported from Manila, and chiefly to Spain and Great Britain, says M. W. Harrington, i *Scientific American*.

A better quality of sugar, but in smaller quantities, is obta from the violet-coloured cane in the central islands of Panay Negros. The very best comes from the province of Capiz, o north coast of Panay. This sugar is imported from Ilo-ilo, a sent chiefly to the United States.

The processes of manufacture are yet crude and antiqu There are a few large plantations, and these are generally mona These plantations are usually leased to Chinese half-breeds, whom better results are obtained than from Europeans. The s cultivators perform their own work with hired labour, but s under the difficulty of not being able to manufacture economic There is a tendency toward their absorption into larger est under the charge of corporations.

The Manila hemp is so called because of the resemblance o fibre to that of hemp, at least in colour. It is derived from the stem of a banana plant (Musatextilis). The plant has an ine fruit, and grows in poor soil. The best plants grow in south-ea Luzon and the adjacent islands of Samar, Leyte, and Bohol. plant is rudely cultivated, cut down when three years' old, an fibres separated from the surrounding tissue by rude dom machines. It takes two natives to prepare twenty-five po a day.

The coarser outside fibres are exported in the crude state, ch to Great Britain, the United States, and the Australian colo where they are used for making a highly-prized cordage. The fibres are used at home for domestic manufactures of fabrics use dress and ornament. They are light, transparent and very dur The fabrics are varied by using some cotton, silk, or other fibre the Manila hemp.

The native name for the fibre is abacá, taken from the plant. abacá has been introduced into other parts of the world, but conditions of its native home of the Philippines are more favou and the labour is there so cheap that no successful competition been established.

Export of abacá began in 1831, and the amount exported is ste increasing. In 1893 it amounted to 97,787 tons, valued at million dollars.

Next in order of value, but first in popular estimation, is th called Manila tobacco. It is a highly-prized tobacco, classed by as the equal of Havana tobacco, and by a few as its superior. Ce it is that some Manila leaf is imported into Cuba, though it is known how it is used. The Cuban tobacco is classified with re to its excellence, the Manila with regard to its fine appear Manila tobacco is stronger than it looks, and it has a fine b flavour, to which those who use it become very much attached.

The tobacco was made a monopoly of the Government in That is, anyone could raise it, but the Government only could b and could set the price and pay for it when it pleased. It pleased to be two or three years behind in its payment. In this restriction was removed, and small growers now can produ more profitably.

It is grown over Luzon and the neighbouring islands, but very best comes from the two large provinces of Cagayan and Isa in the extreme north-eastern part of the island. Here the suitable for it is now all occupied. The cultivation of the requires little labour. The man of the household usually perf the tillage, and the women and children the rest of the work.

Rather less than half of the crop is sent out in the leaf, and goes largely to Spain and other European countries. The remai is made up into cigars and cigarettes, two-thirds of which are sumed at home and the remainder exported, chiefly to the neighb ing countries of continental Asia and Japan. In 1893 about 1 tons of leaf were exported and near 140,000,000 of cigars. The of this tobacco in the Oriental countries is low. Boxes of excellent cheroots (a cigar open at both ends) can be got for 18

The copra is a preparation of the cocoanut made in great quantities tropical islands all over the world. It seems to be a relatively w product for the Philippines; 11,500 tons were exported in 1893. he cocoa palm is very common and highly prized in the Philippines. ll parts of it are used.

Coffee was introduced in the Philippines, probably in the latter part the eighteenth century from Brazil. The first large plantation as established in 1826, and the production began to extend actively teen or twenty years ago. Latterly the export has decreased very eatly. It used to average 2,500 tons a year, but has recently sunk only 300. This is probably due to the revolution, for the coffee is good quality, some of it excellent.

Unlike Manila hemp and tobacco, the coffee requires some capital the part of those who undertake it. It takes the trees four or e years to begin to bear. Those who are able to make the necesry advances have prospered greatly, and, especially about Manila, ve become rich.

The exported coffees formerly went exclusively to France, but are w scattered well over Europe, usually through Singapore. They e of two sorts, the Manila and the Zamboanga. The first is grown out Manila, chiefly to the south and east of Manila Bay. It has a all berry and is more highly prized than the other. The Zamboga coffee is produced in the south, principally on Mindanao and e Sulu Islands. The berry of this variety is larger, but less care used in its preparation. It goes directly to Singapore.

Rice is the chief product of the Philippine Islands, but it is not ported. It is the staple food of the natives, and sometimes the pply is short. Both the mountain and lowland rice are produced, d more than ninety varieties are known. It is easy to cultivate em, and in favourable years the yield is very generous.

Maize is grown in considerable quantities. So are the sweet tato, yams, ground nuts, gourds, potatoes, peas. A little wheat raised at high elevations. Among the fruits are the mango, antain, banana, mangosteen, jack fruit, medlars, lanzon and durian, e last especially in the Sulu Islands. The islands are generally ountainous, and at proper elevations the fruits of southern Europe d of Florida flourish, as the orange, citron and sapotilla.

The cotton of this archipelago is excellent, and its production akes some progress. The cacao can be successfully grown and of od quality, but little attention is paid to it. The tea plant has en tried in botanic gardens and is found to thrive. The islands e rich in odorous flowers, and the manufacture of essences and rfumes is increasing. Cinnamon, the pepper tree, and many ner of the valuable plants of the Malay Peninsula and the East dies either grow here naturally or can be easily introduced.

The islands are very rich in forests, and they contain many valule woods, mostly unknown even by name in the rest of the world. here are said to be thirty-two tinctorial woods, giving the entire ries of colours and shades. Among the valuable ones is the ebony, th very black and fine-grained wood, of high value for fine rniture. The magkano of the forests of Mindanao is said to be solutely indestructible by rot. The forests generally remain intact the interior except for Luzon, where they have been extensively inned out or cleared off.

The chief domestic animal is that useful and tractable Oriental ast, the buffalo, not our bison, but the buffalo proper. He is pecially useful in the simple and rude tillage still used by the tives. The horse is small, active, hardy, but rustic. He is derived a mixture of Oriental and Occidental stocks. The ox, goat and g do well, but the sheep are inferior. The most of these animals ve in places escaped from domestication, and large numbers of wild es may be found, usually in herds.

The native manufactures of the Philippines are not few, and their xtile fabrics are especially fine and worthy of a larger market than ey have so far found. The natives make many other things, among em a coarse pottery of great utility.

Valuable minerals are generally diffused through the islands, but w are yet mined profitably. Gold exists generally over the entire ea, in placers and veins, but usually in quantities which do not y with the rude methods employed for its collection. It is mined the Camarines Norte province in south-eastern Luzon and in the isamis and Surigao placers of northern and north-eastern Mindao, but with small results. With the refined modern methods of collecting gold it could be profitably obtained in many places, and probably the prospecting has been incompletely done.

There are two known coal fields, one in southern Luzon, the other on the western slopes of Cebu and the eastern of Negros. The first probably extends over into Samar, and has furnished good steaming coal. One bed is known to be ten to twenty feet thick. In the other there are at least five beds of varying thickness and quality.

Iron ore of excellent quality is known in southern Luzon, especially in the Camachin Mountains, where there are now a few small foundries. Copper ore has long been known in the province of Lepanto. It was early worked by the natives, and in 1862 a company was formed to conduct copper mining in this region. It is also found on Masbati Island, on Panay, and in several other places. Traces of lead and mercury are known, and also of rock oil. Sulphur is obtained on Leyte for use in the powder factory at Manila. It comes from a solfatara at Mount Manacagan.—*Land & Water.*

DISTRICT ASSOCIATIONS.

WYNAAD.

PROCEEDINGS of a General Meeting held at Meppadi on 6th July, 1898.

PRESENT.—Messrs. R. K. Walker (*Chairman*), C. E. Abbott, H. Atzenwiler, Dr. Barboza, E. H. F. Day, A. C. Glenie, J. W. Hockin, R. Lamb, W. Mackinlay, B. Malcolm, J. S. Nicolls, E. H. Powell, S. Robinson, G. Romilly, S. Taylor, and E. deFonblanque (*Honorary Secretary*).

The Proceedings of the last meeting were taken as read.

Subscriptions to U.P.A.S.I.—Proposed by Mr. C. E. Abbott, *seconded* by Mr. H. Atzenwiler, that this Association subscribe the sum of Rs.400 to the U.P.A.S.I. for the year 1898-99. *Carried.*

Delegate at U.P.A.S.I. Annual Meeting.—Proposed by Mr. G. Romilly, *seconded* by Mr. H. Atzenwiler, that Mr. J. W. Hockin be W.P.A. delegate at the Annual Meeting of the U.P.A.S.I., and that the sum of Rs.175 be paid towards defraying his expenses. *Carried.*

Cattle Trespass.—Read letter from the District Magistrate, Calicut, with enclosure, stating that the maximum penalty for cattle respass in Wynaad Taluqhas been raised to Rs.50. *Recorded.*

Civil Hospital.—Read letter from the President, Wynaad Taluq Board, to the President, District Board, Malabar, and forwarded by the latter to the Honorary Secretary, Wynaad Planters' Association, on the subject of estate coolies presenting themselves for treatment at the Civil Hospital without letters from their employers. *Proposed* by Mr. G. Romilly, *seconded* by Mr. R. Lamb, "That a very strong protest be made by the W.P.A. to the Collector of Malabar against the statement made by the President of Wynaad Taluq Board to the effect that coolies are sent in destitute to the Vayitri Hospital without money or letters from the Superintendents of their estates; and to ask that, if any such cases should occur in future, notice should at once be given to the Superintendents who are accused of sending their sick coolies adrift." *Carried.*

Pudu Padi Hotel.—Read letter from Mr. T. J. Ferguson. *Proposed* by Mr. R. Lamb, *seconded* by Mr. E. deFonblanque, that Mr. Ferguson be asked to obtain the consent of the surviving subscribers to the Pudu Padi Hotel Fund to hand over the fund to a committee of three or five gentlemen to be appointed by the W. P. A. *Carried.*

Roads.—Proposed by Mr. G. Romilly, *seconded* by Mr. C. E. Abbott, that the Secretary, U.P.A.S.I., be asked for an answer to the letter from Wynaad P.A. of 21st January on the subject of roads: also that the Secretary to the Government of Mysore be asked for an answer to the letter of 21st August, 1897, on the subject of the condition of the Sultan's Battery Gundlepett road.

Sultan's Battery Post Office.—The Honorary Secretary was requested to write to the Postmaster-General asking for an answer to the petition of the Association that the Sultan's Battery Post Office be made into a "sub" instead of a "branch" office.

U.P.A.S.I.—Mr. G. Romilly stated:—

1. That the Annual Meeting would be held at Bangalore on Monday, 8th August.

2. *Lady-birds.*—That Mr. Newport had returned from Australia, but that unfortunately, when he came to thaw out the lady-birds on his estate, they were all found to be dead. He attributed this to the fact that the captain of the S.S. *Oroya* had insisted on putting them into the refrigerating room, and that he himself did not see them until arriving at Colombo, when he found that damp had got into the cases.

3. *Currency Committee.*—That Mr. Acworth and Mr. Robert Elliott would both be summoned to give evidence before the committee, but that Mr. Hodgson's evidence had been declined.

Papers on the Table.—Central Travancore Planters' Association, Lower Pulney's Planters' Association, Shevaroy Planters' Association, Coorg Planters' Association, Annual General Meeting North Mysore Planters' Association, Nilgiri Planters' Association.

A vote of thanks to the chair closed the proceedings.

E. DEFONBLANQUE, *Hon. Secy., W.P.A.*

NELLIAMPATHY.

PROCEEDINGS of a Meeting held at Victoria Bungalow, July 11, 1898.

PRESENT.—Messrs. Barnes, Everington, Fenton C. Hall, F. Jones, Welchman and J. C. Abbott (*Hon. Secy.*) Mr. C. Hall in the chair.

Read proceedings of last meeting.

Quit-rents.—*Read* letter to the Dewan and his reply thanking the Association for so readily agreeing with his suggestion. *Read* circular from the Dewan stating that cheques would be no longer accepted in payment of quit-rents, but that payments must be made in cash or currency notes.

Hospital.—*Read* letter from the Medical Officer stating that the Dewan approved of the proposed site near the bazaar, and that steps would be taken to acquire the land. The Honorary Secretary was requested to write and ascertain when the buildings were likely to be commenced.

Roads.—*Read* letter to the Chief Engineer calling his attention to the bad condition of the bridge and causeway in Poothoondoo Estate. As no reply has been received, the Honorary Secretary was requested to write again and point out that great inconvenience was being caused by this road being blocked.

Lady-birds.—Read extracts from Mr. Newport's letters. The Association notes with regret that Mr. Newport had not succeeded in bringing back any of the lady-birds alive.

Currency.—*Read* extracts from the correspondence on this subject.

Annual Meeting, U.P.A.S.I.—Read letter from the Secretary, U.P.A.S.I., stating that the meeting would commence on the 8th August. Messrs. C. Hall and J. C. Abbott were elected to represent this Association.

New Members.—Messrs. G. H. Foster and A. Jones were elected members of this Association. A vote of thanks to the Chairman terminated the proceedings.

(Signed) C. HALL, *Chairman.*
(„) J. C. ABBOTT, *Hon. Secy.*

CENTRAL TRAVANCORE.

A COMMITTEE MEETING of this Association was held at the Penshurst Bungalow, at 9 A.M., on Saturday, the 9th July, 1898.

PRESENT:—Messrs. F. M. Parker (*Chairman*), A. E Veale (*Honorary Secretary, Medical Fund*), H. M. Knight, B. Laurie, R. H. Goldie, and H. W. Baker (*Honorary Secretary*).

Medical Fund.—Mr. H. M. Knight (proxy for Mr. R. S. Imray), in introducing this subject, expressed his dissatisfaction with regard to the medical attendance at the Mount, Munji Mulla and Arnakal estates, and also respecting the insufficient supply of medicines during the last few weeks. In reply, the Medical Fund Secretary explained that the short supply of medicines was entirely owing to the unexpected increase in the number of cases of sickness on those estates during the last few weeks, and in consequence of which the usu supply was insufficient to meet the demand.

After a long discussion, it was resolved to refer all other matte relating to the fund to the General Meeting.

Read letter from District Magistrate and Superintendent of t Cardamom Hills, with reference to the proposed sale of the Pala buildings on Peermaad, and it was resolved that owing to the site and general plan of the buildings already erected that they were n of such a nature that they could be made available for esta purposes. Members interested in or wishing to offer for same we therefore requested to communicate direct with the Superintende and Magistrate of the Cardamom Hills.

Read correspondence from Secretary, U.P.A.S.I., and approve With a vote of thanks to Chairman, the meeting closed.

PEERMAAD, H. W. BAKER,
15*th July*, 1898. *Hony. Secy., C.T.P.*

A General Meeting of this Association was held at th Penshurst Bungalow, at 10 A.M., on Saturday, the 9th Jul when there were present:—

Messrs. F. Bissett, R. H. Cole, D. H. Deane, R. H. Goldi C. N. Grimshaw, H. Holder, H. M. Knight, L. G. Knigh B. Laurie, W. H. Leahy, F. M. Parker (*Chairman*), A. Veale, H. W. Baker (*Honorary Secretary*), R. S. Imray *proxy*, and E. Latte as *visitor*.

1. *Proposed* by Mr. A. E. Veale, and *seconded* Mr. H. M. Knigh that the Secretary be directed to communicate with the Chi Engineer, drawing his attention to the very dilapidated and unsa condition of the ferry "jungars" at the Periar river crossing ar the urgent need of repairs to same. *Carried.*

2. *Proposed* by Mr. D. Deane, *seconded* by Mr. B. Laurie, that th condition of the bridge at the 18th mile and the road between th 8th and 10th miles on the Kottayam-Peermaad road be broug to the urgent notice of the Exec. Engineer, Northern Division, they seriously interfere with the traffic on the road. *Carried.*

3. *Proposed* by Mr. Holder, and *seconded* by Mr. Bissett, that th Honorary Secretary do communicate with the Dewan regarding th construction of the bridge across the Pambanar river, and also of minor bridge at the foot of the Granby Hill, on the grant-in-a road from the 50th mile Peermaad road to the Granby Mount an Arnakal estates, and request the grant of the amounts necessary f the construction of the bridges (either thro' the D.P.W. or Associatio and pointing out the necessity for the construction of these bridge owing to the frequent and continued blocking of the traffic, on th grant-in-aid road, on every occasion that rainfall causes the slighte rise in the rivers, to the great inconvenience of all the estates serv by this road. *Carried.*

4. *Proposed* by Mr. H. M. Knight, and *seconded* by Mr. R. H. Co that the Secretary address the President, District Board, Madur calling attention to the state of the road, known as the Kumili gha which is overgrown with jungle in many places, and also to the sta of the bridges on the Kumili ghat. *Carried.*

5. *Proposed* by Mr. Holder, and *seconded* by Mr. Deane, that th present prospects of the tea industry do not justify the maintenan of the Medical Fund on its present financial basis, and that son arrangement should be come to whereby the work can be efficient carried on, but on a more economical expenditure. *Carried.*

6. *Proposed* by the Chairman, and *seconded* by Mr. Laurie, that sub-committee consisting of Messrs. Holder, Goldie, Leahy, Laur Deane, Knight, Medical Fund Secretary and Chairman and Secretar C. T. P. Association, be appointed to settle details as to future mea of carrying on the work, and that Mr. H. M. Knight be requested accept the position of delegate from this Association to wait on th Dewan and confer with him as to what State aid may be count on from H.H's Government for the future in the carrying on this very important and necessary work. *Carried.*

Mr. Knight most kindly undertook to carry out this arrangeme on receipt of all particulars regarding the work of the fund duri the time it has been in existence. A vote of thanks to Mr. Knig for his promised assistance in the matter was unanimously carried

7. *Proposed* by the Chairman, and *seconded* by Mr. Veale, th Mr. H. M. Knight be requested to undertake the duties of delega

this Association at the General Meeting of the U.P.A.S.I. in ngalore in August next. *Carried.*

The Chairman proposed a vote of thanks to the two Honorary retaries for their trouble in preparing for the press the informa- relating to the Association and other local affairs. *Carried.*

Read correspondence with the Secretary, U.P.A.S.I., and circular ices, which met with the general concurrence of the meeting.

Papers laid on the table :—

Proceedings, Nilgiri	Planters' Association,	13th	May,	1898.
Do. Coorg	do.	do.	25th Feb.,	,,
Do. do.	do.	do.	31st May,	,,

Circular letters of the Indian Tea Association.

With a vote of thanks to the Chairman, the meeting closed.

PEERMAAD, H. W. BAKER,
h July, 1898. *Hony. Secy., C.T.P.A.*

ROUND THE BUNGALOW.

NOTES BY "A PLANTER'S WIFE."

make plate powder.

Silver and electro-plated goods should be wet as little as possible. Spoons, forks, etc., must be washed with good soap only. Never soap powders; these are most destructive to the plating. Take pound of best whiting, and one eight-anna packet of rouge powder, th to be had at any chemist's. Put the whiting on a sheet of wn paper on the table, bruise every particle, then sprinkle rouge over. Rub together with a knife till the whole becomes ale pink powder, which in use and appearance cannot be told m the best plate powder. If the silver is tarnished, use a piece damp flannel to apply the powder, but under ordinary circum- nces use dry and polish with leather. Plate may also be kept ght and in good order by the use of plate rags, which are made follows.

ate rags.

Boil soft rags in one pint of milk and one ounce of hart's horn powder for five minutes; them as soon as they are taken out for a moment in cold water, d dry before the fire. They should be used daily to polish plate er washing it.

preserve oranges whole.

Make a syrup of three pounds of sugarcandy in one quart of water; put good and sound oranges into this, and then boil very slowly the liquid is reduced to one-half. Limes may be treated in the me way. When cold and put away in jars, stir in a wineglass- of rum for every pint made. *N.B.*—They will not "keep" long less under lock and key.

Fruit which is to be preserved in syrup must first be blanched or iled gently, until it becomes soft enough to absorb the sugar; d a thin syrup must be poured on it at first, or it will shrivel stead of remaining plump and becoming clear. Thus, if its weight sugar is to be allowed, and boiled to a syrup with a pint of water the pound, only half the weight must be taken at first, and this ust not be boiled with the water more than fifteen or twenty inutes at the commencement of the process; a part of the remain- g sugar must be added every time the syrup is reboiled, unless should be otherwise directed in the receipt.

o make barley sugar.

Boil clarified loaf sugar to crack or caramel, using a little acid to prevent graining; pour out on a garble slab which has been previously led or buttered. This is occasionally flavoured with lemons. hen required pour a few drops of essential oil of lemon in the ntre before the edges are folded over; then cut into narrow rips with a large pair of scissors or shears. When nearly cold vist, put into glasses or tin boxes, and keep closed to prevent e access of air. It is seldom boiled higher than crack, and saffron used to make it the colour of caramel.

arley sugar drops.

Boil sugar as for the preceding. Spread finely powdered and sifted loaf sugar on a table or tea-tray, with a piece of stick round the ends; make several holes, into which run the sugar from a oped pan; or drop on an oiled marble slab with a funnel, letting ly one drop fall at a time; or from the lip pan, separating each op with a small knife or a straight piece of small wire. Take off e stone with a knife, mix with powdered loaf sugar, sift from it, nd keep in glasses or tin boxes.

aking tea.

The best way to make tea is to take a clean earthenware pot, make it thoroughly hot, then place the tea therein, a teaspoonful for each person. The water to be used should boil, then be immediately poured on the tea. If allowed to boil over, the peculiar property of boiling water which acts upon tea evaporates and eventually disappears. The tea should be allowed to draw six minutes and then poured out, as in this way you gain the full flavour, quality, and strength without extracting the tannin, which is so injurious to the digestive organs.

Household Tit-Bits.

Stains of tea or coffee may be removed from linen by being soaked in warm water as soon after they have occurred as possible, and then soaped and rubbed. They will disappear at the next washing. When they have been left for some time, an application of pure glycerine is effective. Lemon and salt also removes stains from the fingers. Do not use soap afterwards.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (*July* 8, 1898) says :—

A dull tone prevailed at auctions this week and sellers again found it very difficult to dispose of their coffee and a large proportion had to be bought in.

About 1,000 bags East India were catalogued consisting chiefly of small lots of undesirable kinds which met little demand and only a small part sold.

Costa Rica formed the bulk of the Central American offered and sold slowly at 1/ to 2/ decline, but one or two home trade marks realised previous values.

Futures have been a very quiet market and quotations at the close show practically no change on the week.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending July 6th, 1898, says :—Bank rate 2½°/₀. Bombay Exchange closes at 1s. 3⅛d. Brazil Exchange 7$\frac{13}{32}$d. Rupee paper 3½ °/₀ 62½. Silver 27$\frac{5}{16}$d. per oz.

We have little change to report in this market during the past week, supplies, which have been on a small scale, have met with scarcely any demand, and prices show no material alteration. Fine growths, which are scarce, only meeting with good competition.

Brazil markets continue very quiet.

Daily receipts averaged 6,500 bags in Rio, and 11,200 bags in Santos.

Futures remain dull, and close without change, viz. :—Good average Santos in Havre, September delivery, fcs. 36.00, in Hamburg pf. 29¾, and No. 7 low ordinary Rio in New York $5.70.

To-day's London official quotations are :—

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," 11/12, Second Line Beach, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 11 and 12, Second Line Beach, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 12th August, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Pollibetta, *3rd August.—Weather.*—Heavy rain from 24th to 29th inclusive, ·90 in. on 24th; 1·25 next day; 1·50 the next; and 1·90 the next. Total for the week nearly 6 inches. Fair weather again since last date named; but some smartish showers on 1st, totalling about ½ an inch. *Plant-diseases.*—Removing bored trees the second time commenced. Leaf-disease not in evidence yet in old coffee, but has shown up in nurseries and supplies. *Labour.*—Canarese beginning to come in. *Health.*—Good.

COMMERCIAL FERTILIZERS.

The representations of the U.P.A.S.I. with respect to the imposition of an Import Duty on Chemical Fertilizers have borne fruit. The Duty is to be removed, and the Government of India is now considering what articles shall be included in the term "Chemical Fertilizers" and admitted into the country free of duty. If the expectations expressed at the last Annual Meeting of the U.P.A.S.I. are fulfilled, this will mean an increase in the employment of fertilizers, followed by an increase of crops. No doubt, there are still some planters of the old school who are averse to spending money in this direction. There are men who point to what was done in their day, *without* manures: how many hundredweights of coffee each acre yielded, and so on. But the majority of planters have come to consider that the question of soil fertility is of primary importance, and that soil which was almost exhausted by their predecessors

cannot be treated in the same manner as was the virgin soil first tickled by the latter's efforts to obtain crops from it. With the question of soil fertility,—that is to say, in regard to any but virgin soil—the question of manuring is closely allied. Experience has shown its necessity. Experience has dictated which classes of manure are most beneficial under certain circumstances. Careful study, as well as practical experiment, has placed definite and accurate knowledge concerning manures at the disposal of the agriculturist, and the functions of fertilizers in relation to soils and crops are now a matter of scientific knowledge. It has come to be understood that to maintain an evenness of fertility a soil must have put into it the ingredients that are taken out of it by the product cultivated. To quote an American writer on the subject :—"This is to a large extent accomplished by feeding the crops grown on the farm to animals, carefully saving the manure and returning it to the soil, and if it is practicable to pursue a system of stock-feeding in which those products of the farm which are comparatively poor in fertilizing constituents are exchanged in the market for feeding stuffs of high fertilizing value, the loss of soil fertility may be reduced to a minimum, or there may be an actual gain in fertility." This kind of manuring is not usually sufficient, however. It has been found that, as a rule, the manure produced on the farm is not sufficient to maintain its fertility. And if the need for artificial manures on farms has thus been proved, how much greater has it been found to be on places like coffee and tea estates, where the produce of the soil is not used as food for cattle, and eventually returned in part to the soil in the form of natural manure. It has been found that artificial fertilizers must be used either to make up the deficiencies of farm or estate manures or in specially intensive cultivation ; but it has also been proved that they give best results when used on soils well stocked with organic matter (humus), for the maintenance of which regular application of the bulky farm manures (including green manures) is essential.

Nitrogen, phosphoric acid, and potash are the constituents most likely to be deficient in soils or most quickly exhausted by the production and removal of crop. The chief aim of artificial manures is, therefore, to return one or more of these constituents to the soil, and the efficiency of a particular manure must largely depend on the proportion of different essentials in it as compared with what is necessary to the refertilization of a particular soil. It would be interesting if planters would make a more general effort than they do at present to discover for themselves what the constituents of local soils are, and how they might best be improved. Tons of valuable manures may be wasted, and thousands of rupees expended, through a misapplication of fertilizers. Planters should not purchase artificial fertilizers until they have recognized the truth that science and experience alike teach. To quote the same authority to which reference has been made already : in order to use these manures profitably, the planter should know : (1) that nitrogen, phosphoric acid and potash are the essential manurial constituents ; (2) that the agricultural value of these constituents depends largely upon their chemical form ; (3) that these forms are contained in specific products of a well-defined character a composition, and may be purchased as such from deal and manufacturers, and may be mixed successfully on estate. The last portion of the above remark is a ve important one. The agricultural value of a fertilizer distinct from its commercial value. Buying a ready-ma compound may sometimes involve payment of a large pr to the compounder. If the ingredients of a patent medic are known, it is usually possible to buy them and mix them a much smaller total cost than the price of the same quant of the medicine under the patentee's label. So it is w artificial manures. But the first, and a necessary, st towards success here is, that the planter should kn exactly what ingredients he requires.

We will not dilate further on the points indicated, b will conclude with the following valuable notes by t authority already cited, viz., Mr. EDWARD B. VOORHEES, M. Director of the New Jersey Agricultural Experime Stations. The variations in the composition and value manufactured fertilizers which contain the three essent constituents are due to variations in the character and the proportion of the materials used. The ton basis alone not a safe guide in the purchase of these commercial fer lizers. Low ton prices mean either low content of go forms of plant food, or the use of poorer forms. Fertilize high grade both in quality and quantity of plant foo cannot be purchased at a low price per ton. The b fertilizers cannot exert their full effect on soils that are dry or too wet, too compact or too porous. They c furnish but one of the conditions of fertility. The ki and amount to use should be determined by the value the crop grown and its power of acquiring food. A defin system or plan should be adopted in their use.

THE LADY-BIRD SCHEME.

(*Contributed.*)

GENERAL and keen regret is felt throughout the planti districts of South India at what some call the initial failu of what is now generally known as "The Lady-bi Scheme." Supported by the foremost planters of the day shrewd, far-sighted men, who discerned in the pest whi the lady-birds were to extirpate an evil to coffee, besi which even leaf-disease is insignificant,—it evoked a go deal of criticism from other quarters. The news of the s called failure of the scheme will doubtless be hailed wi satisfaction by the "I told you so" cult. As a matter fact, the scheme cannot be said to have failed, because t first consignment of lady-birds were from one reason another unable to survive the voyage. That they have be transported safely to even greater distances is a matter common knowledge to students of this new form of warfa upon blights. That initial efforts have failed likewise also notorious. Even Professor Koebele, the great expe in this department, had to confess to failure in his p liminary trials. It may be urged that the large amount money expended has been so far wasted. Not so. It w only have been wasted if planters are so destitute of fo sight, are so timid at this first check, that they give up t whole scheme in despair. This we do not believe for moment that they will do. But to reassure the "weak brethren," it may be well to point out that had Mr. Newpo

not been despatched on his mission, had nothing been done beyond correspondence to investigate the matter, we should not have acquired the valuable knowledge we now have.

Mr. Tryon, Entomologist to the Government of Queensland, has assured Mr. Newport that he would have no difficulty in having further batches of insects collected for him at a very small cost. It was estimated that a £10 note would cover all the expenses to India of a batch of three to four thousand of the desired species of lady-birds.

In conclusion, we would urge that it would be a graceful recognition of Mr. Newport's yeoman services in the matter that his salary for July should be paid him in full. For though his work in connection with the actual importation of the lady-birds ceased with their death at the end of June, the writing of the deeply interesting and valuable report occupied him the best part of the following month.

NOTES.

Oranges in Mexico. In another part of this issue, we publish an extract from the *Indian Agriculturist* on orange cultivation in Mexico, which should be of special interest to planters, now that it has been proved that oranges can be exported to London and meet with a ready and profitable market.

Pruning extraordinary. From a Ceylon contemporary, our planting brothers in the Spicy Island hardly believe in the startling pruning theories started by our old friend, "1874," and the wonderful outturn obtained thereby.

Whilst the method is considered thorough and practicable, an outturn of over 1,600lb. per acre is absurd, and should any garden adopting his method make, say, 500lb. per acre over a period of five years, Mr.—— I mean 1874, should be entitled to a premium of not less than 10% on nett profits.

But, seriously, a man who knows and thinks to launch such a theory—for it is a theory only on an educated body of men—means either he under-estimates the mental calibre of his readers, or the climate of Chota Nagpore generates a "*rot.*"

Adulteration of coffee. From the home papers to hand last mail, we find that the authorities are quite alive to the amount of adulterated coffee sold as the pure article. At Newcastle-upon-Tyne, a dealer was fined 5/- and costs for selling a mixture containing 59% of chicory, and at Bruff, Co. Limerick, a grocer was prosecuted for selling coffee with an admixture of 56·4% of the same matter. In the latter case the summons was dismissed, as the label contained the word "Chicory," but at the same time it is pleasant to know that a campaign is being carried on against the adulteration of our staple commodity, more especially when the consumer only receives less than 50% of the pure article.

A great deal of money has been spent in educating the taste of the B.P. for the appreciation of pure tea, and there is a wide field open to the adventurous and hard-up planter who will take a lecturing tour, and by precept and example show the middle classes that chicory is *not* a *sine quâ non* for the very best brew of the stimulating beverage.

Tea Market in London. A correspondent to a contemporary writes:—

"There does not seem to be much of a tea market nowadays. There are about five large buyers, and they seem to compete with each other as little as possible, so much so that I hear some of the large companies are about to sell in Colombo."

There can be no doubt that, notwithstanding the increase of consumption they have undoubtedly caused, Lipton and Co., Ld., and a few other large retailing houses, have practically closed the London market to general competition, and reduced prices. With their enormous capital they have, in many cases, outsidised the smaller buyers and dealers, and control the market to their own advantage. Whether selling in Calcutta or Colombo would benefit the producer we are very doubtful, for it goes without saying that the directors of these large concerns would very soon realize the position and send out their own buyers.

The only way is for individual planters to try and push sales through their own relations and friends, and create a knowledge of the advantages, both in price and quality, of dealing direct with the planter, or a recognised Indian agency.

Tea advertisements. We all know that Morton Mayer & Co. are endeavouring to force the sale of Indian tea in India, but there seems some vested interests to prevent the expansion of the idea.

A few advertisements on the lines of one culled from an American exchange would in a short time bring the fact that all Western Asiatic requirements in the tea line could be obtained from Hindustan, and a few million pounds very quickly be relieved from the London market:—

Make up your mind to pay more money for tea very soon; the new war tax is 10 cents per pound, and already the markets, both wholesale and retail, are advancing.

If you come or send here quickly you can still buy at old prices.

Vantine's teas are all put up in air-tight pound packages, which preserve the strength and flavour till wanted for use. So you are doubly safe in laying in a considerable supply ahead of the demand.

These are the old prices, and remember that each pound you buy is really worth 10 cents more:

English Breakfast, 40c, 60c, 75c, $1.00, $1.50.	Uncoloured Japan, 40c, 60c, 75c, $1.00.
Formosa Oolong, 40c, 60c, 75c, $1.00, $1.50.	Russian Caravan, $2.00.
Orange Pekoe, $1.00.	India, 40c, 75c.
Young Hyson, 75c, $1.00.	Ceylon, 60c, $1.00, $1.25.

A good way to buy tea, especially if you live in the country, is in our new decorated tea caddies. Each caddy holds twelve one-pound packages, and the prices are less than in single pounds. Caddy free:

12 lbs. 40c tea	$4.32	12lbs. $1.00 tea	$10.80
12 „ 60c tea	6.48	12 „ $1.25 tea	13.50
12 „ 75c tea	8.10	12 „ $1.50 tea	16.20

12 lbs. $2.00 tea for $21.60.

To introduce our Chinese crystallized ginger more extensively, we will, for a short time, sell the 25c-cans cans for 19c.

A. A. VANTINE & CO.,

Largest Chinese, Japanese and India House in the world,

877 and 879, Broadway, N.Y.,

Between 18th and 19th Sts.

A Prize! *The Planter* (Calcutta) offers a prize of two gold-mohurs for an article of one thousand words, proving conclusively, and authoritatively, which is the oldest tea garden actually opened

in India, excluding indigenous areas growing wild. The competition will close on the 31st August, and only *bonâ fide* subscribers to *The Planter* will be allowed to compete. On a cognate subject the Darjiling correspondent of our contemporary writes :—

A few days since there was a discussion at a planter's bungalow regarding the original home of the tea plant. Opinions were divided. A few maintained it was China; the majority that Assam was the original home of the plant. This led me to write my note for *The Planter*. Since then I find that the articles appearing in *The Planter* on "Tea: its Cultivation and Manufacture," bear out the opinions of the majority, where the writer says in the paper of the 16th of July: "The probabilities are that Dharma only became acquainted with the tea-plant and the use of its leaves as a beverage while travelling through Assam and Burma along the range of hills which connect these countries with China. In such case he carried the knowledge gained, and the seeds of the plant, or seedlings, along with him, and added to his saintly character by the diffusion among the Chinese of his knowledge, and of the seeds or plants." I suppose most men will be inclined to receive the above as a fact, but at the same time leave some room for doubt, since the whole matter is so shrouded in mystery—or rather, that there is nothing actually known as to where the plant *originally* came from. To show that, supposing the tea seed was taken from India to China, where the plant deteriorated, the fact of the seed being imported again into India, where it has grown into a large plant with large leaves, and does not appear to be a China plant, but approaches very near the hybrid, of which I can give an example. There is a tea garden in this district on which the bushes are growing now, and giving a good yield of leaf, from the first lot of seed sent up by the Government to the then Superintendent of Darjiling in 1858. Many of these bushes are over six feet in diameter, and would very probably have been twelve to fifteen feet high if they had not been regularly pruned in the winter. I fancy there are a very few tea gardens or plantations which can go so many years back; and not that only, but to be able to point out the plants growing from the tea seed first supplied by the Government. This, I think, goes to prove to a certain extent that the seed has come back to a climate or locality congenial to it, and from which it may have been originally removed.

Blue gum oil and Typhoid fever.

During the present, we hope, temporary epidemic of typhoid fever at Ootacamund, Coonoor and the surrounding neighbourhood, the following extract from a northern contemporary cannot fail to be of interest :—

Some time ago I sang the praises of the Salt Bush as a cure for "usar" or salt soils. I now desire to record the virtues of the Eucalyptus oil in typhoid fevers. The remedy is well-known in Australia; and Maiden, F. L. S., and Curator of the Technological Museum, New South Wales, in his works on the useful plants native to Australia and Tasmania in the chapter on oils, records that a Doctor Kesteven, in two hundred and twenty cases, treated in eighteen months for typhoid fever, had only four deaths: his success was due to the use of Eucalyptus oil. It is a pity that India cannot show the like results. For instance, they have had some fatal cases of typhoid fever in Ootacamund quite lately, and though the b gum abounds, and the oil is common, we do not hear of its use a cure; if given with olive oil it is said to produce astonishing resu more especially if the diet is confined to milk and plantains. So thirty years ago a lady treated her son suffering from typhoid fe to a milk and plantain diet, and he recovered, this was before virtues of blue gum oil were known. As an antiseptic in the tre ment of sores and wounds, it is unrivalled, being three times m powerful in the destruction of bacteria than carbolic acid. It mentioned that an Australian native suffering from a fearful wou over the intestines, and to which a person treated in the ordina manner would have succumbed, was cured by a poultice of Eucaly tus leaves applied by his *gin*. In influenza the inhalation of steam Eucalyptus leaves has cured many; the remedy is also very use in attacks of bronchitis.

In intermittent malarial fevers the oil has been found useful doses of five drops every three hours.

In fact, there are numerous uses to which the oil can be appli with advantage. It may be mentioned that the first plantation Eucalyptus globulus on the Nilgiris was made by General Morg in 1856 from seeds obtained from Australia, and some 150 thousa plants were raised. At the present time there are probably so thousands of acres planted on the Nilgiris with E. globulus. A t at Gaten Park is mentioned in General Morgan's work, "Forestry Southern India," which was planted by General Fred. Cotton, R in 1843. The tree at six feet from the ground in 1870 girth fourteen feet: this under thirty years of age; it is now nearly years' old, and is 20 feet 6 inches at 2 feet from the ground and 16 f at 5 feet. Sixty years is but a small period in the life of a gia gum tree!

The Duty Question.

The following is from the *H. &* which hits on a new line :—

The question whether the consumers of tea need relief from ta tion more than the consumers of tobacco was discussed for so hours in the House of Commons a few days ago. Mr. J. A. Pease to the question in hand, and other advocates of a "free breakfast tabl supported him, Sir William Harcourt showing in the course of t debate that he was inclined to support tea. The Chancellor of t Exchequer claimed to arrive at a vindication of his preference tobacco by calm and judicious reasoning. He had only £1,100,000 dispose of. Each penny in reduction on the tea duty meant a loss the revenue of £980,000. His available funds would, therefore, ha run only to the extent of a reduction of a penny farthing in t pound on tea. He was further influenced in his decision by t consideration that, whilst tea and tobacco stood on the same footin inasmuch as neither were necessaries of life, tobacco had the adva tage of being an industry which, as compared with tea, engaged far larger number of home workers. As regards this last argume presumably Sir Michael Hicks-Beach has studied figures on t subject, but in doing so has left out of calculation tea planters India and Ceylon, who, not possessing votes, are, from an offic point of view, of no account. The argument that, while the smok of tobacco will benefit sensibly by the reduction of duty, tea deale would have been the only class likely to benefit by the reduction tea is plausible, but not convincing. However, the House accept the Chancellor's defence of his own views. The debate has serv to show which way the wind blows, and that the "free breakfa table" programme will not be lost sight of. We are glad to noti that Mr. Rutherford, of the Ceylon Association, is amongst tho who are in favour of the abolition of the tea duty. He spoke plain on this subject at the meeting of the Association on Monday la In view of the fact that it is sometimes advanced as an argume against any further reduction, or the total abolition of the tea du that the leading members of the planting industry are lukewarm the subject, if not entirely opposed to any change, Mr. Rutherfor expression of his views is important.

In continuation of the above, Colonel Filgate spoke ve much to the point at a meeting of the Indian Tea Co., L when he said :—

While urging the necessity for new markets, he called attention the Indian market. He pointed out that it was hard to realise th India consumes on an average 7,000,000lb. of China and Ceylon te all of which has to pay an import duty of 5 per cent. off its valu *plus* cost of carriage to India. Colonel Filgate expressed the opinio

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton :—

61·50	lbs.	Nitrogen.
57·38	„	Potash.
14·92	„	Lime.
13·68	„	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

as others have done, that a large sale of tea in India is possible at a reasonable profit. He mentioned an instance which occurred this last season of tea dust bought in Calcutta at 1½ annas per lb. being sold at Patna at 7½ annas per lb. The directors of the Nedeem Company have strongly urged their managing agents to bring this important subject to the tea industry to the notice of the Tea Association.

LETTERS TO THE EDITOR.

SALTPETRE: A QUERY.

Sir,—In reply to "Chas. H. Oliver," the Kanarese for the above is *cude opoo ;* the Tamil *sora.*

Nilgiris, S. India, 25*th July*, 1898. L. W. Grey.

"SUCKER."

Sir,—Can you, or any of your readers, tell me if the sucker let up from the lower part of a "chick" stump will bear? A friend of mine says not. This is curious, because a sucker let up from the top does certainly give crop, and a good lot, too.

"D."

Balur Estate.

"HINTS ON USING LIME."

Sir,—I shall be obliged if you will be so good as to inform me from what book or paper you took Prof. Person's (U.S.A.) hints on lime, as per *P.O.*, dated 7th May current. I would like to see if there is more about the subject.

Karie Kollie, Mercara, 23*rd July*, 1898. Yours faithfully, A. J. Wright.

[We regret to say we have lost all trace of the source from which we took the extract. Perhaps, some reader who took an interest in the subject may be able to help our correspondent.—Ed.]

MANURING OF ESTATES.

Sir,—In an issue of *P.O.* in February last you had an article on the manuring of estates, and reference to the faith many planters *still* put in with respect to cattle manure. I will now state my experience.

An estate in which I am interested has for years given little over 190lb an acre, and sometimes less. Having the opportunity, I applied cattle manure both in trenches and pits, allowing about ¾ bushel to each plant 4′×4′. This season, the third from the commencement of the treatment, the yield will be about 1,100lb per acre, and no one would know the old wreck of the place it was. Where patches of nothingness were represented, worn-out stumps have rejuvenated, and these worn-out areas are covering the ground with paying growth. From former experience, the only danger I anticipate is, should prices fall, funds run short, and the three-year round system I have adopted be abandoned, the result may be disastrous, but even then the bushes in good heart and high cultivation may carry an estate through, even when *old* bushes have been once thoroughly established.

Planter.

SALTPETRE: A QUERY.

Sir,—With reference to Mr. Chas. H. Oliver's questions in *Planting Opinion* of 23rd instant, to which you ask me to reply, I would say the only native name I know for saltpetre, in either Kanarese or Tamil, is *pottl-uppu.* This, I think, is applied indiscriminately to any and every kind of saltpetre.

Mr. Oliver has seemingly misread my letter in *Planting Opinion* of 16th July. No "right sort of crude saltpetre" was mentioned. There is crude saltpetre pure and simple, that is saltpetre before the salt is educed (made by the A licensee), and refined saltpetre, that is saltpetre after the eduction of the contained salt (made by the B licensee). Mr. Oliver then asks, "How to tell crude saltpetre of the right sort from crude saltpetre of the wrong sort when one sees it?" Crude saltpetre is not unlike the coarse, dirty salt of the bazaars in appearance: refined saltpetre is, in translucent crystal, sometimes rhombohedrons, but usually hexahedral prisms, with di-hedral summits. But Mr. Oliver will never see crude saltpetre anywhere outside a refinery, because, as I have already pointed out, the A licensee is bound to take all the crude saltpetre he makes to a refiner, and its sale to anyone but a B licensee is a criminal offence. *All* saltpetre available to the public is *refined* saltpetre. This latter will vary in purity according to the care expended on the refining process. It may safely be said that no native-made saltpetre is pure. There is a simple test of purity; but as its employment would be illegal, I do not give it.

I trust Mr. Oliver, and other Mysore planters, will subscribe to the projected Co-operative Saltpetre Refinery. If it can be started, subscribers will be able to get saltpetre of far better quality than that ordinarily obtainable, and at a much lower price.

25*th July*, 1898. Toda.

GENERAL ARTICLES.

LADY-BIRDS AND COFFEE.

We call attention to the letter addressed by Mr. Philip to Mr. E. E. Green on this subject. Surely the decision of certain Uva planters to do nothing at this time towards getting the benefit of lady-bird beetles is not well-advised? Mr. Kirby spoke of a levy of 20 cents an acre on coffee; but say that it was only 10 cents, and the collection was confined to 12,000 acres (as it would be difficult to levy on small gardens and acreages), yet, in our opinion, the resulting R1,200 with a similar amount from Government, or R2,400 in all, should suffice to enable Ceylon coffee planters to share in the importation of the anti-bug beetles now expected for the benefit of Mysore, Coorg, &c. We trust neither Mr. Green nor Mr. Kirby will let the matter rest where it is now. With our old staple promising so well this year, it will be a great shame if nothing is done to try and get rid of its chief enemy when so good an opportunity offers.—*C. T.*

"THE PRESERVATION OF MANURE."

A Correspondent sends us the following extract from *Land and Water*:—

"An experiment in the preservation of farmyard manure, carried out by Mr. Shutt, Chemist to the Canadian Agricultural Department, is of interest. A lot of manure, composed of equal quantities of horse and cow manure, was kept in a partially closed shed for a year. In the first instance it weighed 8,000 lbs., and at the end of the year only 2,659 lbs. The reduced bulk was much richer in the elements of fertility than the fresh manure, as it well might be, considering that there was a loss of two-thirds of the original bulk. But, although the percentages of nitrogen, phosphoric acid and potash were greater in the rotten than in the fresh manure, the total quantities were much less. The 8,000 lbs. of fresh manure contained 41·6 lbs. of nitrogen, 24·8 lbs. of phosphoric acid, and 60·8 lbs. of potash, whereas the 2,659 lbs. of rotten manure a year later contained only 23·6 lbs. of nitrogen, 19·5 lbs. of phosphoric acid, and 39·8 lbs. of potash. This is what happens when manure is kept in dunghills for a long time. The loss from dunghills in the open is much more rapid than manure from a shed."

[We thank our correspondent for the extract he has so kindly sent us, but in a country like Southern India, where plantations exist, the improved percentage of fertilizers would make up fully for decrease in bulk. Of course,

if it was on the plains, the decrease in bulk both of "stuff" and fertilizing matter would be of importance, as the cattle shed and manure pit could be located as necessity required, but on the hills similar circumstances do not exist.—ED.]

ABOLITION OF TEA DUTIES.

ADVICES by last mail show that there has been a good deal of writing in the home cases regarding the probable action of the Chancellor of the Exchequer, Sir Michael Hicks-Beach, as to the disposal of his £1,000,000 surplus. Now that he has decided to make "'baccy" cheaper, and maintain the present duty on tea, any discussion on the subject now only relates to the future, when another surplus may be considered a fitting opportunity for making the poor man's breakfast table freer, if not entirely free, of all customs' imposition.

For ourselves we would look somewhat aghast at the abolition, or even abatement, of the present 4*d.* per lb. levied on all classes of tea in England. Our Ceylon contemporaries for the most part seem, if not actually to favour the abolition, at least half-hearted in their condemnation of such a policy, taking as their text that the poorer and middle classes know a good thing when they get it, and will not be imposed upon by a trashy article even if they obtain it cheap.

For ourselves we hardly think that argument holds water: not that we are afraid so much of China's competition—though, at present, with the bolstered rupee, they have a State bonus of nearly 30 per cent.—but that it would lead to an immense quantity of Indian rubbish being thrown on the market and retailed in England at 4*d.* and 5*d.* per lb., and destroying the educated taste for honest sound teas which it has cost many years to build up.

It must be remembered that at present the labouring classes—what with strikes and disputes—are not in the financial clover they were a few years ago, and, though absolutely disliking water, would jump at a dilution of tea.

We have the experience before us of Australian squatters, who, with their means of cooking, for years and years preferred the old "post and rails" tea at 1*s.* 6*d.* to 2*s.* per lb. to the good stuff we were able to supply them at a similar price, and which, for a similar price, would have lasted quantity for quantity double the time.

The same thing will happen with the British workman, whose palate is not of the keenest, and who will not for one moment care about the qualities of his brew if he can get it at between 4*d.* and 6*d.* instead of to 1*s.* 2*d.* as at present, and his needs will induce a lot of hard-up concerns to pander to his requirements, and though undoubtedly it would ruin eventually those who endeavoured to tide over temporary difficulties by cheap plucking and manufacture, a heavy blow would be struck at what has been the rise of Indian planters for the past two decades, viz., the educating of the British public to appreciate an honest tea at a reasonable price to the consumer and a profitable one to the producer.

Another point is not to be neglected, viz., that the Chinese Government is rapidly approaching dissolution, and that in a few years we will have to face the large areas of tea-producing China, not under present conditions, but with British energy, British machinery, without "likin," and on a par with the Indian product. How far it will effect the Indian article it is impossible at present to surmise; but that the present duties make it not only necessary, but impera to maintain a higher grade of produce is unassailable, the reduction of abolition of the duties would encou a lower class tea is manifest, and which would be not retrograde, but injurious, to the tea interest generally.

MANAGING AGENTS' SHORTER CATECHISI

WE make no excuse for extracting the following f the *I. P. G.*, which will be full of interest to those d South who have had a Northern experience and, perh to some of those at present slaving in Travancore :—

What are Managing Agents?
We are the middlemen between the Board of Directors in Lo and the Managers of the Tea Estate.
What is a Board of Directors?
A small body of kindly-disposed elderly gentlemen, who, kno nothing about the working of tea estates, and believin planters are unbusiness-like and unreliable, wisely leave control of the gardens to us.
What is a Tea Estate?
In the eyes of Government, Tea Estates are farms started wealthy philanthropists for the redistribution of population the comfort and happiness of the labouring classes; in the of the Directors they are tea plantations where planters persist, in spite of instructions to the contrary, in growing r Pekoe than Orange Pekoe bushes; but *we* look upon the forming a most reliable and lucrative source of income.
What is a Manager?
He is a planter appointed by the Board to work and look afte gardens, but whose whole time is much better employe supplying us with information and statistics.
What is the chief aim of Managing Agents?
Our chief aim, after taking care of Dowb, is to impress the B with the enormous amount of skilful supervising we brin bear on the Manager.
How is this best accomplished?
By constantly inventing new forms of elaborate statistics t supplied by the Manager, which, republished and sent hom neat typewritten columns, causes the Board to feel how fortu the company is to possess such able and zealous Agents.
What is the great secret of successful management by an Agent
It is to keep the Manager well under control.
Is this easily done?
Yes; it is very simple.
Can you give an example?
Yes; if a Manager in the middle of the season wires us, " Cacharees offering, can I employ?" we do not wire back, "Y or "No."
What do you reply in such a case?
We reply thus: "Estimated expenditure must not be excee but cultivation and efficiency of garden must be maintained

R. J. HARRIS,
6, WORMWOOD STREET,
LONDON, E.C.,
AGENT FOR THE SUPPLY
OF
CHEMICAL MANURES
AND
OTHER PLANTERS' REQUISITES
QUOTATIONS ON APPLICATION.
[Fy.—28-1-99.]

What is the result of this?

The result of this is, that if the Manager employs the Cacharees, we send him a set of statistics to show he is exceeding his estimate; while if he does not employ the Cacharees, we send him another set of statistics to show the cultivation is falling off.

Is it desirable that Managing Agents should understand the working of a Tea Estate?

No; it is most undesirable.

Why?

Because such knowledge would seriously hamper the freedom of our criticising.

Without such knowledge, can the Managing Agents, with confidence, instruct a Manager as to how he is to work his garden?

Yes, certainly; we do so with the greatest confidence.

Do such instructions given at the beginning of a season ever produce a disastrous failure at the end of it?

Yes, frequently.

What do Managing Agents then?

We express to the Board our great disappointment in the Manager; and recommend, reluctantly, that in the interest of the company he be dismissed.

What effect has this system on the Managers?

The effect is distinctly good, for we have every reason to believe that the Manager frequently rises up (from his statistics) and calls us Blessed!

What is a Shareholder?

He is a man of no importance.

THE NILGIRI PLANTERS' ASSOCIATION.

DESPITE a very attractive agenda of thirteen items, the meeting of this Association on Saturday last was very poorly attended, consisting of only Messrs. Edmiston, Windle (*Honorary Secretary*), Cockburn and Groves, the Collector being present as an honorary member, and Mr. Newport to explain the cause of failure of the late consignment of lady-birds.

Mr. Edmiston was called to the chair, and the proceedings of the last meeting were taken as read and confirmed.

The Honorary Secretary read a letter from Mr. Spring, dated 23rd June, requesting the views of the Association on a proposal for making a gauge conversion for the extension of railway communication in Southern India. This, it was said, would link up all the existing metre gauge lines with each other and with the broad gauge of the Madras Railway. The Madras Government supported the scheme, and forwarded it to the Government of India, who, however, desired to have the opinions of all interested in the project, Chambers of Commerce, Planters' Associations, &c., before giving sanction. The meeting resolved to give the proposal hearty support, as the linking up of the various lines would facilitate the transport of planters' produce with the least obstruction *en route*.

The failure of Mr. Newport's consignment of lady-birds was a matter that elicited the sympathy of the meeting for him. It was felt that the result was in no way attributable to any want of care and attention on his part, but to have been caused by the boxes of insects having been entrusted to the steamer's refrigerator on the way out, and, perhaps, to the length of the voyage. Mr. Newport was asked a few questions, and the meeting then resolved to leave the question of future experiments for decision to the U.P.A.S.I. and to such information as may hereafter be obtained on this subject.

The Honorary Secretary next referred to proposals received for obtaining the services of the Agricultural Chemist. That by the Mysore Durbar did not seem to meet with the approval of the Association, while the gentleman got out by Messrs. Stanes & Co. did not fulfil the requirements of a planters' report. The gentleman who has joined that firm is quite prepared to undertake soil analyses as soon as his apparatus comes to hand, but could not immediately state at what cost. It was felt that a planters' chemist is required, and this subject also, it was finally determined, to leave to the discretion of the U.P.A.S.I.

A letter from the Director of Nilgiri Cinchona Plantations was read that gave the results of the working of the bark tendered at Nedduvattum for manufacture of quinine. The 108,934 pounds received yielded from 3·29 to 6·40 units, and is considered satisfactory from a Government point of view. It would seem to be equally so from a planter's point of view and to show the better class of plant is now cultivated.

The N.P.A. sent a copy of their memorial to the Government of India respecting the free encashment of currency notes all over the planting districts of Southern India. The Association approved of the memorial. In the course of the discussion Mr. Newport, who was at the Shevaroys in the early part of the last month, mentioned the difficulties there experienced. He knew of a 100-rupee note that was hawked about the bazaars, and could not be cashed even at a discount.

The Honorary Secretary reported that the currency question was at present before the U.P.A., that he had received a copy of Mr. Ackworth's evidence given before the Commission sitting in London, but which, being marked confidential, he could not read to the meeting, and that the Hon'ble Mr. Hodgson's evidence, before the same body, was not accepted. Incidentally an allusion was made to what this latter gentleman had said on the same subject in Ceylon, but which he said need not be referred to in detail, as it has already appeared in the newspapers, and upon this the meeting resolved to allow the matter to be disposed of at Bangalore. He also stated that he had obtained no satisfaction whatever from the Postmaster-General regarding the disappearance of valuable enclosures posted at Kotagiri. He thought the registration of letters with enclosures insisted upon by the department was an intolerable nuisance and an unnecessary expense, as letters with enclosures, that were not notes or cheques, did not fail to reach their destination. The Postmaster-General was most anxious, he said, to do something, but, so far, he had not traced a single reported case, and had not explained the disappearance of cheques missing.

He next informed the meeting that as the Nilgiri Planters' Association had contributed Rs.672 to the funds of the N.P.A. they were entitled to 67 votes, and this was duly recorded.

The agenda had now reached item XII., and the Honorary Secretary's proposal for an alteration of Sec. 56 of the Forest Act. He urged that this section imposed a hardship on a respectable European in possession of forest produce in requiring him to prove the *bonâ fides* of such possession, failing which a criminal charge could be framed against him. The members present seemed not prepared to discuss the subject, and hence it was relegated to the N.P.A., where the mover promised to urge it.

Mr. Edmiston, at the conclusion of the regular business, asked permission to bring forward a matter that so far was only personal, but which might be within the experience of others besides himself. This was the refusal of the P. and O. Company at Bombay to accept a consignment of tea from him because another estate had put on board a broken chest which showed the contents to be mildewed. He denounced this action of the Company as highhanded and unreasonable, and proposed bringing the matter forward at Bangalore before the U.P.A., but mentioned it on this occasion to secure the goodwill of the Association for his action.—*N. N.*

JAMAICA GINGER.

MR. F. B. KILNER, a resident of Jamaica, has contributed to an American pharmaceutical paper an interesting account of the ginger industry as practised in that island. He tells us that between 25,000 and 50,000 of the Jamaica population depend for their living upon the ginger-crop. The ginger is of two kinds—"blue" and "yellow"—but the plants are botanically indistinguishable; the "yellow" is the better root, being brittle, and more pungent than the "blue", which is tough and fibrous. These, again, are subdivided into "plant" and "ratoon" ginger—the former is ginger planted each season, and the latter is a return crop secured by leaving a part of the rhizome in the ground at the harvest time. Ginger is planted in March and April. Pieces of the rhizome, each with an "eye", are planted. Few planters have settled farms; they clear a piece of the forest, burn the weeds, and plough the soil a little, then do the planting. When once in the ground the plant appears to require little attention, except that it must be well watered, and as there is an abundant rainfall in Jamaica, no labour in this direction is required. Attempts are rarely made to fertilise the plant, manure being scarce in Jamaica, as there are no stables. The most that is done is to plough in the weeds and cover the ground with banana waste. As an experiment, watering the beds with sea-water and sea-weeds has yielded good results; but the average planter is quite indifferent to scientific cultivation, and this is bad for him, because the soil is impoverished by a few ginger-crops, and "dried-up streams, general barrenness—in fact, a

wilderness—marks the progress of ginger-culture." The deep-black soil of the virgin forest is where the best quality is produced, and to grow ginger under this condition involves the destruction of large areas of woodlands by fire. This burning is considered of great importance, as potash and other mineral matters contained in the ashes are deposited to sweeten the ground, while the fire also destroys insect pests. In consequence of the many thousands of acres of land destroyed and abandoned in this manner in Jamaica, the local Agricultural Society has been at work since 1895 on worn-out land, and with the aid of suitable artificial manures have had very encouraging results in reclaiming the land. The Society is extending its operations by securing larger plots and giving aid to planters by furnishing manures, &c. The "ginger season," or harvest, is from March to January. When the stalk withers and the bloom has departed, the rhizomes are twisted out of the ground with a fork, an operation which takes long practice to become expert in. After the soil and fibrous roots have been removed, the rootstalk is thrown into water, when it is ready for the peeling operation. "Peeling-matches," in which the planter gets all his friends to join, are a time of much merry-making in the sable community. The peeling is mostly done by experts with the aid of a simple knife. So far peeling-machinery has been a complete failure. The operation is an all-important one, as may be seen from examination of a transverse section of ginger. First there is an outer striated skin, under which are numerous layers of thin-walled cork cells. The oil contained in these cells in fresh specimens is very pungent, exceedingly aromatic, and almost colourless. As this corky layer contains the greatest amount of oil and resin cells, the deeper the peeling is made so much more of these substances are carried away with the epidermis. When peeled, the roots are thrown into water and washed; the purer the water the whiter is the product. Sometimes lime-juice is used in the wash-water, which gives a whiter root, but as the lime-juice contains saccharine matter and pectose, it prevents drying, and mildew follows. After washing, the rhizomes are dried in the sun, and in from six to eight days they become thoroughly dry. At sunrise the ginger is put out upon a barbecue (platform of stone or concrete) turned over at mid-day and take in at sunset. The average loss of weight by drying is nearly 70 per cent. Experiments have been made with calcium chloride as a drying agent, but the result was not equal to the native method, and the same may also be said of American fruit evaporators in which wood is used as the source of heat. It has been asserted that it is a common practice to bleach ginger with the fumes of chlorine of sulphurous acid, but Mr. Kilner states that no instance of it is known in Jamaica as the planters are unintelligent, and are opposed through prejudice to innovations. Mr. Kilner tried chlorine gas as a bleaching-agent, but the product was of a dirty yellow colour. When the crop is fully dried it is carried mostly by women to the place of sale, which may be from five to forty miles distant. Here it is sold by the "heap," not by measure or weight. A "heap" of ginger varies considerably, according to the law of supply and demand. If the "hands" are finely shaped and large, there are fewer in the heap; if small, dark, and snarly, the pile is made larger. Should the price of ginger in London or New York advance it is because the heaps in Jamaica have been diminished, and should the price go down the heaps have become larger. The exporter of ginger assort the produce into four or five grades, the highest being the large-sized hands of light and uniform colour, the lowest being the ratoon finger sorts, which are small, soft, and lacking flavour. Some of the hands weigh as much as 8 oz. The amount of ginger exported from the island during the last ten years was as follows:—

	lbs.
1887	1,121,827
1888	1,141,877
1889	1,002,653
1890 (half-year)	554,193
1891	1,219,197
1892	1,822,531
1893	1,526,884
1894	1,673,384
1895	1,736,460
1896	1,960,609

Half of this goes to the United States. An average crop ma estimated at from 1,000 to 1,500 lb., dried ginger per acre, a some cases 2,000 lb. As already mentioned, the Jamaica Ag tural Society is improving the methods of cultivation by fert tion, and from information recently to hand it is predicted tha crop now about to be gathered will probably be a record one, p due to an abundant rainfall. This will mean lower prices fo ginger-planter.—*The Planter.*

ORANGE CULTIVATION IN MEXICO.

It is generally supposed that the Spaniards introduced several v ties of fruit trees into Mexico, among them perhaps the sweet ora but the traveller in that country, after seeing the numerous fo of wild oranges, inclines to the theory that the ancients knew of fruit, and that perhaps it was cultivated before the time of Co However, works treating on the history of old or ancient Mexic not describe oranges; yet it is to be presumed that the existing stock, found generally in obscure and inaccessible regions o tropics, was placed there originally by the hand of man, and Na spread it widely, but gradually changed it from a sweet to a sou bitter orange. The United States Consul-General in the ci Mexico says that the Mexican orange comes under the fa Aurantiacea, genus citrus. Although fifty varieties are know exist, there are but three kinds of oranges found in the market o country, classified as follows:—The sweet orange, "naranja dul the Chinese orange "naranja de China;" and the sour ora "naranja de agria." The "naranja de China" is a small fru little over two inches in diameter, spherical, slightly depresse the apex, deep yellow in colour, thin, with minute oil cells, and delicious; its tree is somewhat dwarfish, having small leaves, one to one inch and-a-half long, and resembling those of the my The sour orange has a roughish, rind, rather thick, acrid, b pulp, and is generally large in size; its tree is large, ha a hard wood, and in many places develops a trunk of g dimension; the leaves are of a brilliant, agreeable green co aromatic, lanceolated, and with a broadly-winged petiole. sweet orange could be greatly improved and much could be complished with it by careful selection in its propagation- instance, selecting shoots, cuttings, or seeds from trees, or budd or grafting with sound stock from California and Florida. T are few countries that possess the natural advantages which tropical and tropical Mexico enjoys, and hardly any are gifted v the immense proportion of territory comprising two-thirds of Republic, suitable for orange culture. The greatest producing most important districts, having easy means of transportation La Barca, Ocotlan, and Guadalajara, in the state of Jalisco; Yaut Morelos, Linares and Montemorelos, Nurvo Leon; Rio Verde San Antonio, San Luis Potosi, Guaymas and Hermosello, San Jula, Tamaulipas, and Coatepec and Cordoba, Veracruz. In Mo morelos and Linares, during the last three years, more than 50 trees have been planted with several hundred grafted and bud with California and Florida stock. The Mexican people relish fruit, and especially on the occasion of the holydays—All Saints' and the Posasdas—vast quantities of it are brought into the princ cities for home consumption. Mexico city alone consumes annu more than 300 cart-loads of sweet, Chinese, and sour oranges, w Puebla consumes 70 and Guadalajara 30 cart-loads. As regards by-products of the Mexican orange, the leaves (*hojar*) are used for tea of the Indians and of the poor, and in large cities, where they sold in the streets and in the markets in small bunches for one h penny each, are consumed in large quantities. They are conside the best remedy for insomnia and restlessness, and are hig commended for children. A wine is manufactured from the re oranges, purchased at about one shilling a hundred in Cuan Morelas, and Guadalajara, which retails at two shilligns a bot There are other valuable products which could be obtained, such distilled water of the blossoms, used for toilet purposes, worth ab 19*s.* a gallon; citric acid from the pulp of the sour oranges; oil fr the leaves and rind; and the essential oils from the blossoms, lea and unripe fruit. Mexican growers propagate the orange from s but it can be reproduced more advantageously by budding, grafti

MANURES.

Fish Guano. Steamed Bone Meal. Poonacs:—Castor, Mowra, Hoongay. **Saltpetre, Crude and Refined** (Nitrate of Potash.) **Nitrate of Soda. Sulphate of Ammonia. Sulphate of Potash. Muriate of Potash. Superphosphates. Phosphate Powder. Kainits Salts.**

Mixtures can be made in any proportion without extra charge. **Packing** can be done to suit transport by bullocks, etc.

Prices will be furnished on application for delivery either at our Karaparumba Works, Calicut, the Calicut Railway Station, Palghat, Mettapollium, Salem, or at our godowns in Cochin, Tellicherry, Mangalore and other places.

Quotations will be obtained and orders booked for any **Manures** not kept in stock.

F.r.m.

layering, and from cuttings. The fruit appears in the latter case in from four to five years. Budding and grafting have to be practised on grown trees. Propagation by cuttings can be effected from both immature and mature growth. In propagating by seed, a well-ventilated place, yet free from cold winds, is selected; the soil must be deep and susceptible of being irrigated. For this process, good vigorous large seeds must be chosen from healthy fruits and best plants. In May the seed beds are made, and in June the seeds, which have previously been kept in earth, are sown 4 inches apart by 8 inches between the rows. The rows can be run with the length of each seed-bed, thereby producing 427 seedlings to the seed-bed. Having soaked the seeds from 12 to 20 hours in lukewarm water, previous to sowing them, the plants should come up in fifteen to twenty days. If the rainy season has not set in, and on dry days during that season, the seed beds are sprinkled every two days, but when the plant has made its appearance, a generous application of water is necessary every day, the amount being decreased as the plant grows. In May the ground is ploughed, cleared of all weeds, and fertilised with cheap manure, having plenty of nitrogenous matter. After the land has been well worked, ditches are run at a distance of about 13 feet apart, and then cross ditches of the same distance. At the intersection of these ditches hole 2 feet deep are made for the reception of the young trees; this will give 245 trees to the acre, which can be decreased on a very rich soil, making the distance 16 feet apart. Great care is taken in transferring the young plants that they are not in any way injured either in leaf or root. A ring (*cajete*) is hoed round each tree, wide enough to admit manure, and in connection with the ditches referred to above, for irrigation purposes. If it does not rain all day following the transplanting, the plants are irrigated, and afterwards so often as they require it Two or three days after, if the earth around the plant has settled, loose soil mixed with leaf mould or manure is issued to make up the loss. When the trees are mature, dead and ill-shaped branches are removed with pruning saw, the round being trimmed with a knife and then tarred over. Wax can be substituted for the tar if the former is not obtainable, and this is done to prevent decay entering into the heart of the tree. Maturity of crop varies very much in Mexico. In Campeachy, Chiapas Oaxca, Guerrero, Atlixo (Puebla) and Yautepec (Moreles) the fruit ripens as early as July and the season lasts until December 1, while in Cordoba and Coa (Veracruz), in Michoacan and Jalisco until September, Rio and Montemorelos following and the Sonora crop comes in about November 10. The yield in Mexico varies very much- climate, proper irrigation, pruning, and cultivation being impo factors in determining the extent of the crops. In Atlixo, Yau and Tacambaro the trees average 860 oranges each, but in Atolc Montemorelos, and Hermosillo, the average yield is from 1,' 2,200 oranges a year. With the advantages of climate and so tree in Mexico should yield from 5,000 to 8,000 oranges. The t not generally subject to any pest, nor is it affected by disease.—*Indian Agriculturist.*

TEA IN CHINA IN 1897-98.

THE latest Consular Report on the China and Japan tea trade that the export of tea in 1897 was nearly 16,000,000 lbs. below t 1896, but the earthquakes in Assam, the appreciation of the r the small output of Foochow teas, and a local combination flood the home markets precipitately, tended to make the seaso unprofitable. Some of the old faults of Foochow teas appear to been eradicated; such as mixing the leaf of the old season with of the new, or introducing an excessive proportion of dust; an native firing of teas is very highly spoken of. But none of the methods of preparing teas appear to have proved a complete su Hand-rolled teas are said to have been a failure, and shade-drie are not well-spoken of except in a few small parcels when quality was excellent and would command very high prices.

DECLINING CULTIVATION.

At present the cultivation of tea is scarcely remunerative. Kien Ning and Yen Ping prefectures rice is said to be taking its In this neighbourhood the sweet potato receives more attentio in remote tea districts curing-houses are being offered for s missionaries. But Oolong Seu-moo, Souchong, and Pan-yon retain, and in some cases improve, their position. The compe for Oolongs, some Souchongs, and Flowery Pekoes is still very nothing like them being produced in India, but the smallness supply is said to be one great cause for the demand, and the de

might decrease if the supply were largely increased. It is difficult to see how China can regain her position in the tea trade, but more attention to the picking of the leaf and to the cultivation of the shrub are essential. Their position as shareholders in the Tea Improvement Company may, perhaps, excite Cantonese compradores to take a more lively interest in the gardens. When after Canton had held the monopoly of this trade since 1820, part of the tea trade drifted back to Foochow in 1854, in consequence of the Taiping Rebellion, it was through their Cantonese compradores that mercantile houses opened up the trade, and it is through them that the trade is now carried on. By advances of money at high interest to local tea dealers, and by commissions on purchases of teas for their employers, the compradores' profits still continue to exist, though grievously cut down, but they are foreigners in the country, and have not the same interest as natives in its welfare.

Importance of Foreign Trade.

The importance to China of the maintenance of its foreign tea trade is far greater than might be imagined. The consumption of tea in China is restricted even in the provinces which produce it to a small class. Even in Fuhkien, outside of the literary class and merchants, the majority of the people use tea dust of different grades, and in provinces where tea is not grown other leaves take its place. In England, 6 lbs. per head of the entire population is the average consumption. In this province it is probably nearly 3 lbs. per head even among the small fraction of the population who are tea-drinkers. If the foreign export is lost to the country, the result to be looked for is not that those teas which were formerly shipped abroad will be prepared for home consumption, but that much of the land will go out of cultivation, or be devoted to some other crop than tea, and that the condition of the cultivators will be still more impoverished than it is at present. The export now is only one-third of what it was in 1880-81, and it is believed by some of the most experienced foreign residents that the acreage which has already gone out of cultivation for tea is enormous. The outlook for the coming season is not so unfavourable as it has been for years past, as the home markets are not glutted, but large consignments of tea placed rapidly upon the market would soon reproduce the disadvantages under which the Foochow tea trade has long laboured and the need of combination to restrict shipments is manifest.

Review of Business in 1897.

The tea market for season 1897-98 opened on May 24, which was about the usual date for the commencement of business. In exceptional years the opening has been delayed by the wide differences of ideas as to prices between buyer and seller, but this season there was nothing to stand in the way of an early agreement being come to. The tea-men had bought their teas at very low prices in the country, and the foreign buyer had a lower sterling exchange of nearly 10 per cent. as compared with the previous year, wherewith to reckon the laying-down cost of his purchases, so that a scale of prices, satisfactory to both, was arranged without difficulty. A fortnight later the steamer *Glengyle* left with 2,338,000 lbs. It was thought that this was rather a large quantity to forward in one bottom in the face of the diminished deliveries of China tea in London, and merchants, by way of giving some protection to their first shipments, addressed a memorandum to the agents of the Conference line of steamers, asking that after the departure of the *Glengyle* there might be an interval of a week between the departure of each subsequent steamer calling to load, and that no steamer should carry away over 1,000 tons of tea from this port. This was agreed to. The weekly purchases from that time were smaller, and comparatively light shipments were made at intervals until the season came to a close in January. A similar agreement was entered into between shippers to Australia (where also the deliveries of China teas were falling off apace) and the Australian steamship companies; departures at stated intervals were arranged, and a limit of quantity to be taken by each steamer was fixed at 1,000 tons for the first two, and afterwards 700 tons for each.

Quality of Crop.

The quality of the crop was no better than last season's yield, except in the case of Congous from the Panyong district, which were superior in the cup if not in make of leaf. A feature of the season was the absence of teas of "finest" quality, and the very limited supply of "common." The Souchong crop was poor in quality as compared with last season. The Oolongs were, on the whole, superior, especially in the "choice" lines. Practically, there were no "common Oolongs" brought down, owing to the restrictions placed upon quality in the United States, of which the tea-men had been given early notice. The few thousand packages that found their way to this market remain in stock, and are likely to remain so: not that the teas are very low in quality, but the line is drawn at rather a high standard in the States. The prices paid at the opening of the market—that is tael prices—were rather lower by half a tael per picul on the average than at the opening of last season, but the sterling exchange was 2*s.* 0¼*d.* per dollar against 2*s.* 2¾*d.* for four months' sight credits. In July, when the reported shortness of the crop began to become apparent, and the exchange began to fall, the tea-men stood out for an advance in price and obtained it. From this date prices continued to harden as exchange continued to fall until the early days of September, by which time exchange had dropped to 1*s.* 9¾*d.*, when the accumulated advance in tael prices was shown to be 2 taels per picul from the lowest point.

Supplies.

The falling off of supplies is shown as follows:—In Congou, 30 per cent.; in Souchong, 18½ per cent.; in scented tea, 14 per cent. An increase is shown in Oolong of 25 per cent., and in flavour Pekoe of 6 per cent.; the total decrease in the aggregate of all kinds was 22 per cent. As regards the future of supplies, there is every reason to anticipate that they will be smaller each year, for what with the heavy export duty and likin, amounting to 30 per cent., and the profit taken by the tea-men or middlemen, through foreigners being excluded from the interior, there is little or nothing left for the unfortunate grower.—*The Planter.*

ROUND THE BUNGALOW.

In no position in life is the art of domestic economy of greater importance than in the household arrangements of the average planter, whether married or bachelor. In our community it is certainly not exceptional to find members brought up in the comforts of life, not to speak of its luxuries, who have to cut their coat according to their cloth, and realize that necessity of using judiciously whatever material they have in hand, whether it is food, clothing or money.

That there is a great deal of waste in many planters' bungalows must be often noticed. Economy is not necessarily stinginess, but instead of allowing odds and ends to accumulate or go to waste; it behoves planters, and their wives especially, to see that these small items are utilized for the best. In my own experience I have often seen a couple or two of nice beef-steaks thrown to the dogs, which, if economy had been studied, would have added not a little to the change of ménu so often desired by the tired planter, and would have helped to turn out some dainty dish which would whet the appetite for stronger nourishment.

Bouillon. The common soup of France, is a dish peculiarly adapted to a planter's bill of fare, and to manage this successfully a stock-pot is required. But a close-fitting saucepan can be used. Place three pounds of beef with two quarts of water in the stock-pot and put on to a *slow* fire till it gradually becomes hot. By this means the fibre of the meat is enlarged, the gelatinous substance dissolved, and the most savoury part of the meat is diffused in the broth, thus forming a nutritious soup and a dish of tender meat. Add half an ounce of salt to every quart of water, three or four turnips and carrots, a head of celery, onions stuck with cloves, a teaspoonful of pepper corns, and a bunch of savoury herbs. It will require about five hours to boil.

The two following receipts are very useful in using up cold meat, and will be found economical as well as tasty :—

Forced cabbage. Take a fresh cabbage, wash well in cold water and drain. Take out the heart or centre of it, leaving a circle of leaves standing. Cut off the stalk, but not so close as to cause the cabbage to fall apart. Have ready plenty of force meat made of minced cold meat, a little potted ham, greated bread crumbs, sufficient butter to soften the whole, powdered spice, grated lemon peel, and two hard-boiled yolks of egg crumbled fine. Fill the cabbage full with this, and, to keep it in shape, tie firmly round in several places with twine in the form of a round ball. Put into a stew pot with enough water to cover it well, and boil till thoroughly done. Serve with brown sauce.

Fritters. Take some thin slices of cold roast meat and trim them in a circular form. Beat with a rolling pin to make them tender and season with a little salt, pepper, powdered nutmeg, and some fresh-grated lemon peel. Beat four eggs, and gradually stir in one pint of milk in turn with half pint of flour. Have ready a frying pan nearly full of boiling ghee

or lard. Drop into it two large spoons of butter, then put in a slice of the meat, and cover it with two more spoonfuls of the butter. As the fritters are fried, take them off with perforated skimmer and drain them.

To remedy sour wine. The souring of wine is produced by various circumstances,—sometimes from its having been kept in a warm cellar, where it has been exposed to draughts of air, often by the vibration caused by the rolling of heavy bodies over the cellar; but most frequently it originates from the wine having been imperfectly fermented. The only safe remedy for the souring of wine is the cautious addition of a little tartrate of potash; it may also be mixed with a larger quantity of rich wine of its kind, at the same time adding a little good brandy. Wine treated in this way should be fined after having stood two or three weeks, and then immediately bottled and consumed as soon as possible, for it will never prove a good-keeping wine.—*Dicks.*

WHEN YOU CANNOT SLEEP.

So far as outside matters go, a man can sleep almost anywhere. Habit settles it. A sailor sleeps in the forecastle of a tumbling ship, and a soldier alongside of a big gun in a bombardment. One of the best night's sleep I ever had was in the open air on a prairie in Western America, the grass for a bed, a blanket for a pillow, and my horse for company—the only living thing within fifty miles of me. But, pshaw! that was luxury compared with some situations in which men sleep sound as bricks in a wall. Habit does it as we said.

Hence, Mr. Fred Downs' loss of sleep had nothing to do with his being a commercial traveller. Commonly, these useful gentlemen can sleep wherever night overtakes them—in hotels or in trains, in quiet country towns, or in the midst of a racket fit to drive anybody else fairly wild.

No, it was not outside, but inside matters that kept Mr. Downs awake. He tells it this way: "In August, 1890, I found myself a way below par, like many stocks and securities. I had no appetite, my stomach was cold and sour, and there was a nasty taste in my mouth that nearly made me sick. I tried eating light and simple food, but I had intense pain after it at the chest and sides, and between the shoulder-blades.

"Instead of sleeping I rolled about the bed all night long. I felt really more tired and weary than a man does after a hard day's work."

[At this point in Mr. Downs' story we beg to insert the remark that the sense of fatigue or exhaustion is the result of a loss of strength; and that it makes no odds at all whether the strength has been used up in labour, or has dwindled away through lack of nourishment. Pump the water out of a cistern, or let it leak out, it's gone just the same.]

"I got very weak," says Mr. Downs, "and had great difficulty in following my business as commercial traveller. I tried medicines right and left, as anybody would, but none of them seemed to hit my case. In this way a year went by. At last I made up my mind to see if your remedy would help me. I had often heard it well spoken of, but never before had occasion to use it. I took it a few weeks and it did me a lot of good. My appetite improved, and my food agreed with me. For this good reason I kept on with it, and was soon as well as ever. It also cured my wife of indigestion from which she had suffered for years. (Signed) Fred Downs, The Rookeries, Bradford Road, Brighouse, Yorks, Dec. 28th, 1893."

Mr. Samuel Dunn had the same trouble. We needn't repeat the general symptoms, as they were identical with those described by Mr. Downs. Alluding to the effect on his nerves, Mr. Dunn says that for eighteen months, dating from the spring of 1885, he did not know what it was to have sound natural sleep. On that, as we might expect, he grew so weak he often had to leave his work for a day or two at a time. He took the usual assortments of drugs and medicines without getting any more good from them than Mr. Downs had done. It was always that way. Medicines don't cure because they *are* medicines; *they must be adapted to an understood disease;* that's the common sense of it.

"Finally," says Mr. Dunn, "I got so low that I felt I must have relief if I was to live much longer. In October, 1886, I began using Mother Seigel's Curative Syrup, and in a few weeks I was well, and have been so ever since. But for the good luck that let me know of the Syrup I might have been dead before this. (Signed) Samuel Dunn, 2, Well-field Street, Mill Lane, Warrington, December 29th, 1893."

We mustn't forget to say that Mr. Downs was cured by the same remedy of the same complaint—indigestion and dyspepsia—and if there is anything on earth that murders sleep as that does, we hav heard of it. If Mother Seigel's Curative Syrup had no other r it would deserve the gratitude of mankind on account of its p (being no narcotic) to seal up aching eyelids and lock weary se in forgetfulness.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (July 15, 1898) say A slow market still continues at Public Sales and a large proporti the coffee brought forward had to be bought in, the rest selling at e values.

About 1,100 bags East India were catalogued, but prices were deci lower for the small quantity sold; one or two parcels of cherry however realised very full rates.

Central American kinds also met a very dull demand and the mod supplies of common grades sold cheaply, although here and there a c parcel brought steady prices.

Futures are 6*d.* lower on the week in consequence of the increa Brazilian receipts and rather cheaper cost and freight offers.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Market the Week ending July 13th, 1898, says :—Bank rate 2½%. Bombay Exch closes at 1s. 3 2/32d. Brazil Exchange 7⅛d. Rupee paper 3½ % 63. S 27¼d. per oz.

This market continues quiet, and little demand is apparent, excep fine desirable growths, which have brought extreme rates. East I and medium kinds are very slow of sale at irregular prices. Plant Ceylon sold well with spirited competition.

Brazil markets steady but quiet.

Daily receipts averaged 7,100 bags in Rio, and 11,100 bags in Santo

Futures have shown a little more firmness, and close 3d to 6d per dearer, viz.:—Good average Santos in Havre, September delivery, 36.25, in Hamburg pf. 29¾, and No. 7 low ordinary Rio in New $5.65.

To-day's London official quotations are :—

	July	Sept.	Dec., '98.	Mar.	May,

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," 11/12, Second Line Beach, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 11 and 12, Second Line Beach, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 19th August, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Polli Betta, 10*th August.*—*Weather.*—The week ending 6th instant was *pucka* monsoonish,—gloomy and rainy, though less rain was gauged than one fancied had fallen. Break since Sunday 7th. No rain yesterday and day before. Total for week not 2 inches. *Plant-diseases.*—Leaf-disease showing up in water-logged patches. Removing and burning borer trees still going on. *Labour.*—Sufficient. *Health.*—Good.

Kotagiri, 11*th August.*—*Rainfall.*—Inches 4·23 in July, bringing rainfall to end of that month up to inches 19·74 against average due inches 22·15. No rain so far in August. It is very dry and windy and out farther east. Kil Kotagiri and Kodanaad way, where rainfall is very short, the drought is telling by reduced tea yield. Coffee trees on the droop, and dropping crop every day and without early rain, it must run light. Basket planting out withstanding dry weather and high wind remarkably well.

THE U.P.A.S.I.

Beginning at 2 p.m. on the 8th instant the planters brought their Annual Meeting at Bangalore to a close soon after noon on the 11th idem. A fairly comprehensive summary of their proceedings appears in our present issue,

but the most interesting part is yet to follow. There was a discussion in Committee on leaf-disease and experimental planting, and we are informed that this will be placed at the disposal of the Press as soon as possible. The work of reporting such a discussion, much of which must necessarily have been of a conversational character, is very great, and no doubt the report will need careful revision at the hands of the Chairman or Committee of the Association before it is laid before the public. We are, however, warranted in saying that Mr. CAMERON, Superintendent of the Mysore Government Gardens, who was present by invitation as a visitor, made some very interesting statements, and that several planters gave more or less detailed accounts of experiments they had made with respect to the hybridisation of Coffee. As regards scale pests and lady-birds, Mr. NEWPORT confirmed his report, lately published. His remarks on what was recently said in these columns with respect to the condition in which his *protegés* reached India were modest. We should like it clearly understood that we impute no shadow of blame to Mr. NEWPORT in regard to his inability to thaw the insects out alive. All we wish to comment on is the fact that failure at any single point of a chain of experimental importation may involve failure of the whole scheme. The Association has acted wisely in deciding to seek further information before trying to import further supplies, and we anticipate that a good deal of information will be forthcoming when inquiries are made in the right quarters. In this connection, we might also suggest that the Association should try to obtain from abroad help and information on other points. New Coffee seed from the West Coast of Africa, or Jamaica, or Abyssinia, or Arabia might be obtained through official channels, and a fillip given to the system of experimental hybridisation to which reference has already been made.

In deciding to seek incorporation under the Indian Companies Act of 1882, the Association aims at the acquisition of a strength and importance that is impossible to an unregistered Association. We wish it success. In discussing "Crop Estimates," the Reduction of Tea Duty in London, "Shipments of Tea per s.s. *Nurani*," Classification of Coffee, the Madras Forest Act (Section 56), and sundry other points, planters showed that they desired to keep well in line with the times. They also gave some indication of the varied character of matters that affect planting interests. Roads and Communications produced some interesting remarks on roads and railroads; and on the subject of finance there was an interesting discussion, practically ending in a very cordial vote of thanks to Mr. G. L. ACWORTH, who has been working like a Trojan at Home to get the views of planters properly represented to the Currency Committee. These are all points of importance, though, naturally, their importance differs considerably. What we would mostly impress upon our readers is this, that the Association is not only trying to do good work, but has done a good deal. A notable illustration of the effect of representations made, and made again, and yet again, to Government, was seen in the announcement made at the meeting that the Goverment of India had admitted that the planters had "made out a case" with respect to the matters investigated by the South of India Planters' Enquiry Committee. It remains to be seen what action will be taken by the Government of India, but we may express the hope that the acclamation with which the above announcement was received may not prove to have been premature. If Governm follows the suggestions of the Committee of Enquiry, c the Labour Law hinted at in the *Madras Mail's* Simla n on the subject is based mainly on the draft submitte Government some time ago on behalf of the U.P.A.S Madras, Mysore, Travancore, Cochin and Coorg Plan will have much to be thankful for.

There remains one important subject to be noticed. discussion as to the need of an Agriculturist Chemis Southern India led to a decision that one was required the Madras Presidency and one for Mysore and Co This was, in the opinion of the Association, the very l that would suffice; and members had evidently come the conclusion that the matter was eminently one in wh Governments should take the lead. How could a n serve but the Madras or the Mysore Government the United Planters Association? What chance wo such a man have of giving satisfaction? Either he wo not know to whom to look for orders, or there would b constant clashing of interests, and he would be require two or more places at one time. We cannot but think there is urgent necessity for the provision of at least Agricultural Chemists in this part of the world, and t while the Mysore and Coorg Administrations might sh the expenses of another, the Madras Government ou certainly to have one entirely under its own cont Planters are willing to assist by paying fees, and U.P.A.S.I. is ready to make an allotment of cash towa the expenses. But the Government should accept the only, and retain absolute control on the movements operations of any scientist it may decide to employ. feel sure that all planters will agree to this. They can afford an expert of their own, and indeed *one* would hav suffice; but they would be only too glad to avail th selves of the services of a local man on any reasona terms. The U.P.A.S.I. has followed this line of thoug and we are certain that under the able guidance of GEORGE ROMILLY, who, we are glad to say, has been elected as Chairman, it will always adopt a policy of c monsense combined with progress and foresight.

RHEA.

IN another column we give an extract from *Ind Gardening* concerning "Rhea," and it now seems reas able to suppose that this easily-grown, profitable, hitherto unmarketable product will take its proper pl amongst the exports from India.

The very fact that a responsible firm should offer £ per ton for 100, and £12 per ton for 1,000 tons open vista of probabilities and profits that makes the mo water, and on the Nilgiris and Wynaad and other porti of the Presidency there will be a more sure prop for plant to depend on than any of the side products propo from time to time to help in times of bad seasons and l prices.

Up till now the process of cleaning the fibre a preparing it for use in European markets has been only obstacle to the spread of the industry. In Wynaad in the early "eighties," Mr. J. W. Minchin, "Glenrock," sufficiently proved that the soil and clim were admirably adapted to the growth of the plant, and

was only that the Death & Ellwood machinery, the most recent and improved at that date, was not able to sufficiently clean the fibre for the London market that interfered with the absolute success of the undertaking. From the financial point of view, Rhea should be a greater success than either tea or coffee, for we learn that in the Straits Settlements 300 sticks will give 12lb. of white degummed filasse, which is the daily produce per acre, and taking 300 working days to the year, this would give, say, 1½ tons per acre per annum, or, say, £18 per acre.

Another point is, the plant is perennial, and after planting out, and having attained a 3-ft. growth, it requires no weeding or cultivation, thinning out being the only field work.

The root is said to survive thirty to forty years.

Another great point is that the leaves of the Rhea plant are very nutritious, and are greedily eaten by cattle—a great boon to planters.

And still another point is, that, after a first area has been put out from seed or bought plants, the plantation can be extended from root cuttings, which is the best method of propagation.

In our issue of November 7th, 1896, in discussing this subject, we had the following extract from the Calcutta *Planter*, which is equally true to-day: "The value of ribbons stripped and dried in the rough is from £16 to £18 per ton in London, and this, even paying for all the extra freight referred to above, pays, and if raised in large quantities would pay handsomely; but £7 to £10, which is sometimes named, will never pay; in fact, would barely cover expenditure." But if, as we understand, the offer of the firm referred to above is likely to be followed by other firms at a similar figure, the objection is obviously overcome.

The absence of preparation and consequent non-necessity for the erection of buildings and machinery will be in favour of the planters, and the cost of which interfered with the success of previous efforts to make the cultivation and preparation of Rhea profitable dispensed with; and with the multitude of uses to which the fibre can be put, we look forward to a long and profitable career for this product, now that the market will accept the fibre, without any skilled preparation, the bark only having to be separated from the stalk.

Great stress is laid on the fact that the fibre must be perfectly dry before packing, so that no injury should be incurred during transit.

The *I.P.G.*, in an article on this subject, sounds a warning note, however, "that the untutored ryot must not be entrusted with Rhea cultivation in the beginning at any rate, as it requires almost as much skilful gardening as tea, and will need the intelligence of the European Planter to place its cultivation on a sound and successful basis."

We trust the warning will be listened to, and that in the rush to be first in the field, an inferior and unmarketable article will not be dispatched to the detriment of the market in its inception, and failure of a source of income, which seems just now open to planters, and at a time when they most need it.

NOTES.

The future of tea. Elsewhere will be found an extract from *Capital* on this subject, which will amply repay perusal. Whilst not entirely agreeing with the hypothesis that a gold standard will cure all our evils, there are arguments which decidedly give food for reflection.

Fruit culture. We extract the following from *Indian Gardening*:—

Kulu Apples at One Anna per Seer!—Under the head of "Fruit Culture in Simla and Kulu" will be found a statement by the Rev. H. F. Beutel (A. C. M. S. Missionary of Kotgar) that he sells Kashmiri apples to the natives at one anna a seer! English, American and Australian fruit-growers should note that one anna is equal to about one penny, and one seer is about two pounds in weight. From six to eight apples go to the seer, or about 16 apples for a penny!

Vanilla. Recently the vanilla bean culture has been introduced into the Seychelles—a group of islands in the Indian Ocean, owned by Great Britain—and from a small beginning it has increased until now it is the principal industry of the colony. There is, says the *Planters' Monthly* (Honolulu), no reason why it should not succeed here as well and become an industry in which Hawaiian women and children may find an agreeable, pleasant occupation and a profitable support.

Para rubber. *Hevea brasiliensis*, the most valuable of the rubber trees. This bids fair to become an important cultivation in Ceylon and other tropical countries (see the last circular of this series). It succeeds best on flat, wet, alluvial soil at very low elevations, but in sheltered positions will thrive at elevations of over 3,000 ft., though the growth is of course much slower; this fact must be borne in mind by any one thinking of opening plantations in Uva, for it means a longer period of waiting for the return.—*Mr. Willis' Circular on the Badulla Gardens.*

A new side product. "Jateorhiza Calumba (*Jateorhiza Palmata*).—This very useful and interesting plant is now flowering freely on the roof of one of the plant-houses in the garden, and forms a very striking object. It is from *Jateorhiza Calumba* that we get the well-known Calumba root of medicinal repute. This drug is greatly esteemed as a bitter tonic, where a stimulant or astringent effect is not required, and is also used in cases of indigestion, and for alleviating vomiting. At one time the plant was supposed to be a native of Ceylon, and the root exported thence to Europe, and so the name Calumba root originated, but the plant has been definitely proved to be a native of Mozambique, where it grows abundantly."

Tea prospects. The *Pioneer* on the 19th ultimo writes as follows:—

In tea shares there has been a strong demand for Central Cachars at 59 and 60, Dehing at 44, and Singell at 80 and 81. The prices obtained at Friday's tea auction were again very satisfactory, and high prices were paid for quality. Prices in most cases were over last year's rates in spite of the adverse exchange, which makes fully 1¼ annas difference. The falling-off in outturn of Cachar and Sylhet gardens is becoming serious, as the gardens do not seem to be making up leeway. The reduction in outturn in this direction helps the other districts considerably, and there ought to be a stronger market for tea when London fully realises the extent of the deficiency in crops. A very encouraging feature is the active demand for Bombay and the Persian Gulf—two markets which have just opened to Indian teas,

but which promise to take off a very large part of what London calls the surplus outturn.

American fruit in Germany.

English and Indian producers and English capital do not receive the same protection as is meted out by the only "William" when competition grows too keen, as will be seen from the following extract from a Calcutta contemporary :—

The German Emperor has done what he considers a good work for the fruit-growers of the Fatherland—he has actually ruined the trade in American apples in Germany. There had been an increasing demand and sale of American apples in Germany. The fruit-growers there became alarmed. They appealed to the Agricultural Department and the Press, and finally to the Emperor himself, who at once determined to give effect to their wishes. The existence of the San Jose scale upon the specimens afforded the desired excuse, and as the result American apples were prohibited from entering German ports.

Rhea again.

Indian Gardening writes :—

It would seem as though a market had at length been found for rhea fibre. This will be good news to those who have long and earnestly advocated the claims of rhea. Mr. D. Hooper, Officiating Reporter on Economic Products, has sent a circular to the Bengal Chamber of Commerce in connection with this subject. He says that he has received a letter from Mr. J. R. Boyle, of the Imperial Institute, London, asking what is the probable amount of rhea produced in India. A new and apparently permanent demand for rhea fibre, he continues, has sprung up in England. One firm has orders in hand to buy up to one hundred tons at £15 per ton, or up to one thousand tons should the price be £12 per ton. Though the consumption at first will be the modest one of from two to three hundred tons per year, it is anticipated that, when the firm is fully at work, upwards of a thousand tons per year will be required. Referring to the conditions in which the fibre must be prepared for shipment, Mr. Hooper states that it need not be prepared by any skilled operation. It will be sufficient to separate the bark from the stalk by the simplest methods, the important point being that the fibre must be perfectly dry before packing, so as to ensure its being pressed light and travelling uninjured. The beginning is a modest one, but if it is followed up there may be great possibilities of a flourishing industry for this country in the cultivation of rhea. We have already written a good deal on the subject of rhea cultivation in this country, and we are among those who believe that the plant is admirably suited to India, and its fibre has a great future before it.

War tax in America.

The *American Grocer* last to hand has another article on the "political puzzle," as it terms it, as to why tea has been taxed and coffee left free. The action of Congress in placing a duty of 10 cents a pound on tea seems to have been a surprise, as the tax was not favoured by either the Committee of the Senate or the Ways and Means Committee of the House. After quoting some figures as to the consumption per head during the Civil War,—which rose from 0·66lb. in 1861 to 1·14lb. in 1871,—the rise in consumption as soon as tea was free of duty to 1·46 and 1·53lb. per head is noted, indicating that the high cost caused by duty cut down consumption. During the Civil War period tea sold for four or five times—in some cases ten times—more than present prices. Tea that brought 75 cents per pound in 1861-65 has sold since as low as 8 cents. "Dollar" tea was the great card with grocers as late as 1885. The addition of a 10-cent duty will not add that sum to the line cost, as part of the tax will be paid by the producers and part taken from the profits of the jobbers. For low-grade tea the consumer may have to pay fully 10 cents more, due quite as much to the standards governing importations as to the tax; but high grades will scarcely feel the duty. However, the *Grocer* concludes that habit is so strong with m people that a 10-cent duty on a favourite article of dr will not prove a barrier to its use.

Importance of Foreign Trade.

"The importance to China of maintenance of its foreign tea tr is far greater than might be imagi The consumption of tea in China is restricted even in provinces which produce it to a small class. Even Fuhkien, outside of the literary class and merchants, majority of the people use tea dust of different grades, a in provinces where tea is not grown other leaves take place. In England, 6lb. per head of the entire populat is the average consumption. In this province it is proba nearly 3lb. per head even among the small fraction of population who are tea-drinkers. If the foreign expor lost to the country, the result to be looked for is not t those teas which were formerly shipped abroad will prepared for home consumption, but that much of the la will go out of cultivation or be devoted to some other c than tea, and that the condition of the cultivators will still more impoverished than it is at present. The exp now is only one-third of what it was in 1880-81, and i believed by some of the most experienced foreign reside that the acreage which has already gone out of cultivat for tea is enormous. The outlook for the coming seaso not so unfavourable as it has been for years past, as home markets are not glutted, but large consignments tea placed rapidly upon the market would soon reprodu the disadvantages under which the Foochow tea trade l long laboured and the need of combination to restrict sh ments is manifest."

Tea and coffee market.

Public auctions have been sing larly unattractive is the dictum the *P. M. Review* during the week ending 9th July, go kinds only meeting with fair competition, the redeemi feature being that deliveries were satisfactory, bei 1,354,000lb. above those in the preceding year. W append a table giving the London Tea Returns :—

The Wagtail-Human Species.

Though we do not know to whom the "Chirria" alludes, for it is he and he only, for we recognise his method, the following is too good to be missed, being so thoroughly adapted to many inanities who reside within the limits of the Madras Presidency :—

1.
Why does the wagtail leave
His happy home
And risk his precious life
On ocean foam?
2.
Why does the wagtail look
As if he knew
All secrets of the earth,
And Heaven too?
3.
Why does the wagtail think
That only he
Knows how to prune a bush,
Or make good tea?
4.
Why does the wagtail make
In fatuous way
Remarks about the time
He made tea pay?
5.
Why does the wagtail raise
In every mind
A feeling of despair
With rage combined?
6.
Why does the wagtail live?
I think that we
Should ease him from the earth.
So let it be!

We only correct the last line, which should run :

"So ought it be!"

The "Rhea" boom.

Considering the interest just now being taken in Rhea, in all planting centres, we reprint the following Consular Report on Ramie cultivation in Mexico, which previously appeared in our issue of December 19th, 1896 :—

			Amount. dols.	c.
Preparation of lands, plantation of roots, and cleaning work during development of plant	...	...	29,537	40
Cutting and cleaning of stalks	...	...	67,989	81
Carriage of stalks to the machine	...	...	30,250	0
Extraction of fibre—				
		dols.		
Salaries	...	7,548		
Fuel	...	2,000		
			9,548	0
Packing	...	...	10,164	0
Carriage to railroad (1,936 tons)	...	...	5,782	0
Railroad to Vera Cruz	...	...	13,126	0
Shipping expenses	...	...	1,936	0
Freight, Vera Cruz to New York	...	...	32,254	0
Assurance against sea risks	...	...	2,420	0
Total cost of crop transported to New York		...	203,007	21

Results.

	Amount. dols.
Product of sale of 1,936 tons of ramie, at 250 dollars per ton.	484,000
Premium of gold on New York in bills at 60 days, 15 per cent.	72,600
	556,600
To deduct commission and guarantees of sale, &c. ...	27,830
Cost of production, &c.	202,078
Net profit	326,692

According to the official documents we will now see which is the necessary capital to obtain these profits :—

	Amount. dols.	c.
Preparation, plantation, cultivation, extraction, carriage, &c.	203,007	21
Machines for extracting and cleaning the fibre, two small steam motors, pumps, presses, &c.	30,000	0
Total capital	233,007	21

The profits amount, therefore, to 145 per cent. on the working capital. Assuming that the square league of land has cost 100,000 dollars, a very exorbitant sum even for the State of Vera Cruz, and passing half the net profits to amortisation, *i.e.*, 47,307 dollars, the capital would be paid back in $2\frac{1}{2}$ years, and during that time a net revenue of 11 per cent. would be obtainable on the total capital. At the expiration of three years a plantation is possessed, which gives a revenue of 94,000 dol., or 22 per cent. of the capital employed, which capitalised at 6 per cent. is worth 1,500,000 dollars.

Coffee.

Only a very limited business has been done this week, the supplies brought to auction have been unusually small, and even these have not all found buyers, a large proportion being withdrawn for better prices. Quotations have, however, been maintained, excepting for the lowest grades of Guatemala, and for these at the reduction there has been rather more inquiry. The few lots of fine qualities have sold freely at full prices, and the opinion gains ground that with a very short Java crop, and with unsatisfactory news from Columbia, there should be a good demand in the autumn for the balance of the East India crop, and what is left of the Costa Rica crop. In the terminal market little has been done and quotations are unchanged; an estimate of the current crop of $8\frac{3}{4}$ million bags has been received, and is looked upon as likely to produce an advance rather than a further reduction.

LETTERS TO THE EDITOR.

MANURING OF ESTATES.

SIR,—Referring to my letter published in your last issue on the above subject, *for* 1,100 lb. please *read* 400 lb.

PLANTER.

GENERAL ARTICLES.

GARDENS IN MYSORE.

THE following extract from the report of Mr. John Cameron, Director of the Gardens and Parks in Mysore, may prove of interest to our subscribers, Mrs. Batchelor, who with her father General Morgan have done so much to encourage the cultivation of exotic and other plants on these hills, being singled out for special mention :—

The year was a particularly trying one, owing to the long drought and the complete failure of the garden water-supply, owing to which a large number of plants perished. Those who are in charge of large gardens on the plains of India know how disastrous to garden plants is a deficiency of water—especially in the hot and dry months of the year. Mr. Cameron, however, is a man of resource, and managed to save his valuable plants. Some of the garden crops, however,—especially fruit crops—were almost total failures. The mango crop was a total failure in all the gardens under Mr. Cameron's charge; the jack and other indigenous fruit crops were much below the average. It is somewhat surprising that the Durbar has so far neglected to provide a proper and efficient water-supply for the several public gardens which the State maintains. There were two flower shows held,—one in August, 1896, and the other in February, 1897. The exhibits, however, at both were below exhibition form, owing to the unfavourable season.

Part II. of the report, dealing with "Cultivation and Experiment," is very interesting. Some very valuable and ornamental shrubs and trees, as well as those of economic value, have been introduced, many of which have been taken very kindly to Bangalore. The most important introduction among fruits, Mr. Cameron says, was the importation of some new varieties of strawberries from England, which are doing very well. We hope to refer in detail to this section of the report in our next issue.

The system of training apprentice gardeners is apparently working satisfactorily in Bangalore. Mr. Cameron has six lads now in training. Their period of apprenticeship extends to three years; but it would seem as if this period was not sufficient, as two who had completed their full term being "young and rather under the average in gardening knowledge" have been retained for another year.

The energetic Superintendent has established a very extensive foreign connection, and distributes plants and seeds to, and receives donations and exchanges from, such distant countries as Australia, Canada, South Africa, the United States, California, China and the West Indies. Among Indian contributors we notice that Mrs. R. Batchelor, of Ootacamund, presented the gardens with seeds of some rare plants, among them the African "Lady's finger," Arabian pomegranate, and African brinjal. There is an artist on the garden establishment who did some good work during the by making coloured drawings of a large number of plants. Cameron has recently directed his attention to coffee, and the vation by him of seedlings obtained by Mr. H. G. Parsons, of E lands Estate, Coorg, by crossing the Arabian coffee wit Liberian, will be watched with interest.

THE FUTURE OF TEA.

THERE is no doubt, says a contemporary, that this is engagin attention of a good many who are interested in the industry bo planters and investors, and so much has been written on the su that we are afraid that anything we may contribute will be what stale. Our view is that the Government of India is mined to establish a gold standard of some kind or anothe that we think it is waste of time to discuss the question opening the mints. Government almost plainly says : "We put our hand to the plough, shut the mints, and intend h no other standard than the monetary one of silver." Now, w real gold standard to be introduced, we should do well to con the future, and what it would bring forth with regard to tea. purposely say a real gold standard or currency, for we ar believers in any of the various nostrums for establishi fictitious gold currency. The comparison is somewhat like of a quack doctor to a real M.D. of any of our universities, one will stand examination, the other won't. We are a that a large number of people think that if a gold currency introduced, it would be most injurious to tea, and we are not pared to go so far as to say it would not affect the industry i ously at first, but after things had shaken down, we very doubt if any real harm would be the result. Wages as well as things would adjust themselves, but doubtless the process of ad ment would be a painful one to many. Among other advan which a gold currency would give would be the elimination o gamble which goes on under our present system of exchange; broker would be able to state definitely the value of your instead of, as at present, very often being accused of ignoran his business, &c., owing to the discrepancy between actual received and valuation due entirely to fluctuation in exchange, not to the quality of the tea sold nor the broker's judgm Another benefit that would accrue to the industry in the mean would be the stoppage of all extensions until it was seen things would turn out. There is no doubt this would be a benefit, as it would give breathing time to conquer new mar and these will be sadly wanted for the next few years. amount of time required for the purpose can best be estimated b amount of tea now sent to Australia, the conquest of which ma was begun some fifteen years ago; the result up to date has the introduction of some seven or eight million lbs. out of a tot consumption of some thirty million lbs. At this rate it will take a time to get twenty million lbs. into America, even if the campai carried on in the same vigorous manner as it has been in the p but there are signs that some of the "go" is being taken out o Commissioners in the way of funds at a time when even more v ous action is called for.

THE LANTANA BUG.

NILGIRI and Wynaad Planters will be interested in following from a Ceylon contemporary. If only the would confine its ravages to Lantana, we opine very would mourn its presence, but when, as from Mr. Wil letter, there is a probability of it attacking coffee becomes serious :—

I.

Mr. E. E. Green writes :—"The enclosed may be of interes showing that we are not the only sufferers from the Lantana (*Orthezia insignis*). The insect has recently attracted consider attention at the Cape as a garden pest. It seems to be particu fond of the ornamental foliage plant (*Coleus*)—a trait which is eq noticeable with the pest here. I have had many *Coleus* plants k out in my own garden." Mr. Green encloses a brief paper b Government Entomologist, Cape Colony, showing that the bu prevalent in Natal and has been known there for the past fifteen y

Some think it is a native of Natal, and altogether there is less fear of its proving a destructive pest from the experience gained in that Colony. This leads us again to mention that a full report on this bug, by the same Entolomogist, Mr. Lounsbury, is produced in the local *Agricultural Magazine* (included in July *T.A.*), from which a good deal of information can be gained. Since writing this, Mr. Willis's latest letter on the subject has come to hand and will be read with interest in another column. Clearly *Orthezia insignis* flourishes in Ceylon as it never did in Natal, and it ought to be fought, in our opinion, by Government as well as by private individuals.

II.

Royal Botanic Gardens, Peradeniya,
15*th July*, 1896.

The Hon. the Colonial Secretary,
Colombo.

Sir,—With reference to your letter of No. 36 of 27th June, 1898, I have the honour to report as follows upon the insect pest that is now so largely attacking Lantana.

2. The insect is a scale insect of Coccid, known as *Orthezia insignis*, and appears to have been introduced in a wardian case sent from abroad to the Peradeniya Gardens. An account of it with figures was published some years ago by Mr. E. E. Green (*Ceylon Observer Press*).

3. During the last five years it has spread to a very large extent, and is now abundant in all the country within 20 miles radius of Kandy, and occurs in other places beyond this radius.

4. It feeds chiefly on the Lantana and other weeds, especially those belonging to the family Acanthaceæ; but at times will feed upon almost any kind of vegetation. It does not, however, seem to find tea a congenial food plant, and has rarely been observed upon it.

5. At present no particular damage is being done by the *Orthezia* to cultivated plants, except in gardens; but the Lantana is being killed out by its ravages, and afterwards there will be grave danger to other plants, though it is quite likely that the insect may never seriously attack tea. Coffee will be in great danger, as the pest already feeds on weeds belonging to the same family.

6. The pest is very difficult to eradicate, and I think that there is no longer any possibility of completely exterminating it; it can only be kept from becoming worse and spreading to important cultivated plants.

7. Planters and other cultivators should be advised to keep a sharp watch on all Lantana and other weeds on the bonndaries of their estates and to cut and burn them, to prevent the insect from getting upon the plants cultivated.

8. In view of the mischief that is done by ignorance in dealing with such matters and the risk that *Orthezia* may become a terrible pest, I propose to publish a circular giving full details as to the nature of the pest and the steps to be taken to prevent its further spread.

I am, etc.,
(Signed) JOHN C. WILLIS,
Director, Royal Botanical Gardens.

FERMENTATION AND OXIDATION.

The following, culled from the *Planter,* should open an interesting correspondence amongst the more advanced of our tea planters. Our own view is certainly "oxidation," though amongst some of our older planting friends we have seen a process which certainly was fermentation, if not actual decomposition :—

"What is the difference between 'Oxidation and Fermentation'? Oxidation (by the way, it is spelt with a 'y' in my dictionary) is a term applied to the union of anybody with oxygen, the body being then said to be *oxidised.* I do not think that this is a correct term to apply to the rolled leaf, which some say undergoes 'oxidation.' The more correct term to apply would and ought to be 'fermentation,' because the change which occurs in one organic substance when influenced by another in a state of decay or putrefaction is called fermentation. Every substance which is liable to putrify becomes while putrifying a 'ferment.' Colonel Money in his 'Essay' on the Cultivation and Manufacture of Tea says: '*Fermenting.*—The balls accumulated are allowed to stand until *fermented.* I look on this being done to the right extent, and no more, as perhaps the most important point in the whole manufacture.' . . . . 'When the tea is ready for firing off over the charcoal, it should be worked off as rapidly as possible, as it is more likely to turn *sour* at this stage than at any other time in the process. Delay in firing off is, in my opinion, much more the cause of sourness than any over-fermentation previous to panning.'

"Since Colonel Money wrote his essay, manufacture of tea has made immense strides, through the introduction of machinery, but the process is much the same; he mentions the term fermentation only. Whereas Mr. Kelway Bamber says on pp. 225 *et seq.* in his essay 'Chemistry and Agriculture of Tea.'"

The tern 'fermentation' has been usually applied to this process, but 'oxidation' more correctly describes the changes in the leaf that take place in the comparatively short time allowed. If, however, the leaf was allowed to lie in heaps for many hours, the temperature would rapidly rise to between 9° and 100° F., and a kind of fermentation would set in, accompanied by decomposition, &c. Most planters will admit that after an hour or at the most two hours after the bolled leaf (if not put into the drying machines) has been taken out of the rolling machine, and—let us say—allowed to ferment, if a rand is passed into the leaf, even if only lying 3″ thick, a perceptible *heat* is felt, certainly sufficient to admit of the process being called hermenting. Mr. Kelway-Bamber is a chemist, and ought to know the difference between the two terms, for he speaks with no uncerfain voice—or rather writes with no unsteady pen, but—and a very dig but—terms which planters have been in the habit of using will tie very hard.

TEA SWEEPINGS.

A Decision has been given by the General Appraisers at New York as to the proper designation of tea sweepings mixed with lime and asafœtida, and which are dutiable at one-fourth of one cent per pound and 10 per cent. *ad valorem,* under paragraph 20, Act of 1897. The decision was rendered in the matter of the protest of Hensel, Bruckman and Lorbacher, against the decision of the Collector of Customs at New York, as to the rate and amount of duties chargeable on certain merchandise, imported per steamer *Manitoba,* and entered October 16, 1897.

General Appraiser Wilkinson's opinion is as follows :—

The merchandise is a novel and peculiar mixture, imported into this country for the first time, and there is no president to assist in determining its proper classification.

The law of May, 1896, prohibiting the importation of unwholesome tea, excluded inferior teas that had been used in the manufacture of caffeine. Under somewhat similar conditions in England, the authorities admitted the tea free of duty after its use as a beverage had been rendered impossible by its being mixed with a small amount of lime and asafœtida.

In reply to a caffeine manufacturer of this country, the Department wrote under date of August 17, 1897 :

The Department is in receipt of your letter of the 11th instant in regard to the proposed importation into the United States of low-grade tea and tea dust for the purpose of making caffeine, and you ask for a ruling of the Department allowing such importation, provided the article is mixed with slack lime and asafœtida—100 parts of slacked lime and one part of powdered asafœtida to 1,000 parts of tea—and that the mixture is imported in bags distinctly marked as a drug.

In reply, I have to say that upon an actual importation of such material, instructions will be issued to the Collector of Customs at the port of arrival to admit the same to entry, provided the merchandise is not imported as "tea," and that its character as tea has been changed by the mixture of slacked lime and asafœtida as proposed.

An importation of tea thus treated was assessed for duty as a non-enumerated manufactured article at 20 per cent., under Sec. 6, Act of July, 1897, and is claimed to be exempt from duty as a crude drug under paragraph 548, or as a crude vegetable substance under paragraph 617, or to be dutiable at 10 per cent. under Sec. 6, or at one-fourth of one cent per pound and 10 per cent. *ad valorem* under paragraph 20. Its character as a beverage having been destroyed, we are of the opinion that the article is no longer tea commercially, but that it has been isolated as a drug. It would seem hardly to be a crude drug, which, as a rule, is a definite thing of an elementary character. But in this case there is a mechanical mixture of a mineral substance with two vegetable substances.

While this combination does not amount to a manufacture, it would appear to be a process of advancement covered by the phraseology of paragraph 20. The advance may be regarded as one of value, for the merchandise would have no value when imported without having been subjected to this or some similar process.

The case is by no means clear, but in accordance with the views expressed, we find that the goods are non-edible drug leaves advanced in value by the addition of a small portion of lime and a minute quantity of asafœtida.

We sustain the claim that the said merchandise is dutiable at one-fourth of one cent per pound and 10 per cent. under para. 20 of the Act of 1897.

General Appraiser Tichenor gave a dissenting opinion as follows:

I must dissent from the reasoning and conclusions of my colleagues in this case. They state, and properly, I think, that the article in question "would seem hardly to be a crude drug, which, as a rule, is a definite thing of an elementary character," and yet they find that the article is a drug advanced in value, etc., and hold that it is dutiable as a drug under paragraph 20 of the new Tariff Act. This impresses me as being illogical and inconsistent. To be dutiable under paragraph 20 the article must be a drug, and, therefore, must have been advanced from the condition of a crude drug.

The essential and characteristic element of this article is tea. Tea in the form of sweepings or otherwise is not a drug, and the mixing of 10 per cent. lime and 1 per cent. asafœtida certainly does not make it a drug. Never having been a drug, I am unable to see how it has become a drug within the meaning of paragraph 20. This paragraph provides for vegetable drugs only, and does not include articles composed in whole or in part of mineral substances.

According to the testimony of Dr. Schaefer, the real importer and owner of the article, it is prepared especially for making caffeine; is mixed in a mill in certain definite proportions of tea sweepings, lime, and asafœtida, and thus prepared, according to his statement, it is entirely impossible to use it for any other purpose. It is, therefore, an article manufactured in whole or in part, being intended as available for a single use only, viz., of being converted into a pharmaceutical preparation known as caffeine.

I am of the opinion that the protest should be over-ruled.—*American Grocer.*

THE UNITED PLANTERS' ASSOCIATION OF SOUTHERN INDIA.

FIRST DAY.

(*From the "Madras Mail."*)

BANGALORE, *8th August*, 1898.—The Planters of Southern India met at the Cubbon Hall to-day at 2 P.M., the forenoon being devoted to a Committee Meeting. The following were present:—

Central Travancore	...	H. M. Knight.
Coorg	...	A. Lambert, H. G. Parsons, C. G. Murray-Aynsley, W. H. Sprott.
Kanan Devan	...	H. M. Knight.
Lower Pulneys	...	H. O. Newport.
Nelliampathis	...	J. C. Abbott.
Nilgiris	...	W. L. Edmiston, E. G. Windle.
N. Mysore	...	E. C. Bolton, Fred. J. Parton.
S. Mysore	...	Graham Anderson, C.I.E. J. A. Harris. Jno. G. Hamilton.
Shevaroys	...	C. G. Lechler, Robert Gompertz.
Travancore	...	H. M. Knight.
Wynaad	...	J. W. Hockin.

The agenda for consideration comprise the following:—

1. Secretary's Report and Accounts.
2. Confirmation of 1897 Proceedings.
3. Election of Office-bearers.
4. Committee of Enquiry 1896.
5. Currency.
6. Agricultural Matters:—
   - (*a*) Coffee Scale and Lady-birds.
   - (*b*) Leaf Disease.
   - (*c*) Agricultural Chemist.
   - (*d*) Cinchona.
   - (*e*) Import Duty on Chemical Manures.
   - (*f*) Adulteration of Manures.
7. Finances (including Subscriptions for 1897-98).
8. Export Duty on Bones.
9. Encashment of Currency Notes at Treasuries.
10. Classification of Coffee.
11. Registration of the Association.
12. Roads and Communications.
13. Crop Estimates.
14. The Madras Forest Act.

THE ACCOUNTS AND REPORTS.

The Secretary read the following report and afterwards pl the accounts on the table, which were confirmed and adopted:—

One year's records merge into another's without much chan subject, for the matters dealt with by the U.P.A.S.I. are seldo a sort of which "Finis" can be written at any time. The however, the sad tale of death to be told in the Association's as in so many others. The

Obituary for this year contains the honoured name of Mr. D T. Brett, first Chairman of the U.P.A.S.I., and formerly Chai of the Planters' Conference of 1893.

At last year's Meeting several subjects were discussed, and so to speak, carried forward for treatment during the year that now closed. The report of the

Planters' Enquiry Committee was considered, and remarks the were submitted to Government. The Madras authorities have k done their best to get matters settled, but, unfortunately, Government of India has not yet arrived at a decision.

Finances.—Last year a new system of assessing subscriptions introduced. The balance-sheet that is submitted to-day shows result. A portion of the Reserve Fund was placed on fixed de for one year, in accordance with the Resolution of the Associ and the decision of the Committee. The term will expire sh and the question of further investment will be settled by Committee after the present Meeting.

Registration.—Your Secretary had engaged to go to Englan September, and though his departure was put off until Dece he handed over charge to Mr. Allan Ronaldson in the earlier m This caused the matter of Registration to be deferred unti return, and it is not yet settled. However, a draft scheme has circulated for criticism, and there should now be no difficul revising it and deciding upon a definite plan of action.

Malaria.—No authoritative information has been received, bu understood that Surgeon-Major Ronald Ross has made de progress with the investigation referred to last year.

Roads and Communications.—In accordance with the Resol passed last year, the U.P.A.S.I. has done what it could to assis Wynaad Planters' Association by backing up its memorial o subject of local roads. So far, Government has not respo The Honourable the Planting Member also laid the matter of before the Government in his speech in Council on the Budget, he pressed on the attention of Government the fact that Government of India had saved in their sterling payments a expense of the producer, and it was only just that some sort equivalent should be returned to him in the form of incr expenditure on public works.

Government Cinchona Bark.—Representations made to Go ment have been so far successful that tenders for the supply of were called for during the year by the Director of the Govern Cinchona Plantations. In reply to your Secretary's enquiry as t results, the Director wrote:—"It was estimated that about 100 of crown bark would be required, and the enquiry for tenders res in 246,018lb being offered to Government, as the unit rate ruli the London market. The total amount purchased during the o year 1897-98 was 108,934lb and payment was made at the uni ruling in the London market at the time of purchase, based o actual outturn of sulphate of quinine after the bark had been w up in the Nedivattam factory. The percentage of sulphate of qu in the barks ranged from 3·29 to 6·40, the average for the quantity purchased being 3·95, and the amount paid for the 108 of bark being Rs.23,999-6-5, or an average of annas 3-6·29 pe He observed that the system of purchasing bark to supplemen yield of the plantations had so far been a success from the Go ment's point of view, and as there was a considerable saving eff in freight and Home charges, by the opening of a market at vattam, it was presumed that the planters whose bark was acc had benefited.

Closing the Mints.—A Circular was issued on the 31st Jan 1898, and on the 14th February, 1898, the Chairman addres

special letter to the Government of India. Subsequently it became known that the Secretary of State had determined to appoint a Departmental Committee to enquire into the Currency Question. Prompt measures were taken to secure proper representation of the interests of South Indian Planters, and though it was not found possible to get a planter appointed a member of the Committee, it was arranged that two from South India and one from Ceylon should be heard as witnesses. Co-operation with Ceylon was also arranged for, and as far as possible co-operation with representatives of the Indian Tea Association has been effected. Mr. G. L. Acworth, ex-Chairman of the U.P.A.S.I., happened to be in England, and was asked to move in the matter. Mr. Robert H. Elliot, of Mysore, also undertook to give evidence; while on behalf of Ceylon Mr. Thos. N. Christie, who was a member of the Ceylon Currency Committee of 1893, was chosen. The statements of Messrs. Acworth and Christie have been circulated among District Associations, and a few copies are laid on the table. It may be mentioned that Mr. Acworth was specially asked to consult with Messrs. Sanderson and Mangles, the Association's representatives on the London Chamber of Commerce, and any South India and other planters who might be in London, especially with the Hon. Mr. H. P. Hodgson, who was willing, but was not permitted, to give evidence before the Committee. The points urged upon Mr. Acworth were, combined action and full representation of the interests of producers in India and Ceylon.

Export Duty on Bones.—This subject appears to have hung fire.

Currency Notes on the Shevaroys.—The U.P.A.S.I. supported the Shevaroy Planters' Association, but the latter is not content with the partial success it has achieved, and the subject is again on the Agenda paper.

Scientific Investigation.—There was no strong feeling in favour of the employment of an Agricultural Chemist, and a month ago the proposition put forward last year appeared to have fallen through. The Government of Mysore then submitted a suggestion that gave fresh life to that proposal. A circular issued on the 23rd July gave details, and the matter was also brought to the notice of the Governments of India, Madras, Travancore, and Cochin, whose replies are awaited. The Mysore suggestion comes up for consideration at the present Meeting.

Scale Pests.—Mr. Newport proceeded to Australia in quest of lady-birds for the extermination of certain scale pests on coffee. His report giving full details is laid on the table, and the accounts are also before you.

Chemical Manures.—Owing to the active personal interest the Madras Government took in this matter, it has been decided that the Import Duties levied on certain chemical manures be abolished. The Government of India has now under consideration what manures, in addition to nitrate of soda, shall be allowed to enter the country duty free.

Coffee Stealing.—The Resolution passed last year has been a dead letter up to the present time. Mr. Hamilton's proposals, which were to be elaborated by the Committee of the South Mysore Planters' Association, were to be considered by your Committee. It lately appeared, however, that the South Mysore P. A. decided to leave the matter entirely to the U.P.A.S.I. Committee. The matter will be brought up for discussion at the present Meeting.

Office Furniture.— A "Remington" typewriter has been purchased under the authority of the Committee. A record box was bought earlier in the year.

Library.—Sanction was taken for the expenditure of Rupees fifty on books of reference, &c., but the transaction has not yet been carried through. It is, however, very desirable that a few books of reference should be available, and the Secretary submits further that it would be well if one or more of the Colombo papers were filed in the office, so that close touch might be kept with the movements and opinions of the planting community of Ceylon.

Audited Accounts for the year are laid before you. They comprise besides the annual statement of income and expenditure (1) a small statement regarding the Famine Fund, toward which contributions to the extent of Rs.20 were received during the year; (2) cash accounts of the Reserve Fund, showing a balance of Rs.7,424-12-0 in hand; (3) cash account of the Lady-bird Fund, showing Rs.1,619-5-4 in hand; and (4) a copy of Mr. Newport's account, giving details of expenditure of the money paid to him out of the Lady-bird Fund. As regards the General Fund, it may be remarked that printing expenses during the year were exceptionally heavy, but these statistics will only appear once in five years. The Book of Proceedings, 1897, contained a mass of statistics, the printing of which was very expensive, but these will only appear once in five years. Then, too, numerous copies of the Report of the Committee of Enquiry were printed, in addition to ordinary circulars and pamphlets. Legal expenses and Incorporation expenses are new items: the former relating to counsel's opinion on an Order of the Government of India under Act XIII. of 1859, the latter representing cost of the Memorandum of Association drawn up with a view to registration of the Association under the Indian Companies' Act. Collections were satisfactory and a balance of Rs.623-15-11 is carried forward. Actual income during the year was Rs.4,461-2-11, actual expenditure Rs.4,245-11-7.

The Chairman (Mr. G. Romilly) then addressed the meeting, commenting on the year's work.

The Secretary's Report.

The Secretary's report and accounts were, on the motion of Mr. H. G. Parsons (Coorg), seconded by Mr. F. J. Parton (N. Mysore), taken as read. Mr. W. L. Edmiston (Nilgiris) then proposed and Mr. J. A. Harris (S. Mysore) seconded that the report and accounts be adopted. The Resolution was carried unanimously.

Confirmation of 1897 Proceedings.

The next item on the Agenda was the confirmation of the published Book of Proceedings of 1897. This was formally done.

The Chairman's Opening Speech.

Mr. George Romilly (Chairman) then delivered his opening speech. He said:—

Gentlemen,—I have very little to add to the Secretary's report, especially as I am to continue in the Chair during this meeting and shall have a good deal to say on several of these subjects when they come up for discussion. I can tell you that I have enjoyed my year of office very much, although it has been a fairly busy one; but I may say I certainly would not have enjoyed it if I had not been so ably assisted by Mr. Ormerod and Mr. Ronaldson. Owing to Mr. Ormerod's untiring energy and grasp of detail there was very little left for me to do but to sanction his suggestions, and I dreaded his departure, as you may imagine. However, the dread was unnecessary, as Mr. Ronaldson picked up the thread of business in an incredibly short time, and proved himself a most efficient ally. The good the Association can do to the community and the prominence it has already gained before the public has been illustrated this year by our action with regard to the Currency proposals. In 1892, before this disastrous policy was initiated, which was of course the time to act, the Darjeeling Planters' Association in the North and our own Association in the South were the only ones that took objection to the measures of Government. Though after a lapse of time all the Associations here present joined with us in the matter, there was no prompt action. This year matters have been different, and we were able to act with promptitude and decision with the result that our remonstrance has been set before the Committee of Enquiry, and we were invited to represent our views by tendering evidence before the Committee in London. Luckily we have two good men at Home in Messrs. Acworth and Hodgson to look after our interests. Though Mr. Hodgson's evidence has been refused, he has given us his assistance in consultation with Mr. Acworth, and though I regret very much their absence from this meeting, still I feel they are rendering great assistance to our cause at Home. I should like here to express publicly to Mr. Newport what I have already expressed to him in private by letter—my great sympathy with him in his disappointment. I cannot imagine a greater disappointment to a man than to identify himself with a scheme of this sort, to get his scheme sanctioned, and be entrusted with the work, and then at the last moment, through no fault of his own, to fail. However, I trust the failure will be but a stepping-stone to success. (Hear, hear.) Gentlemen, I will end by moving a Resolution in which I know you will all join with me. The Secretary has alluded in his report to the death of our first President, Mr. Digby T. Brett. I feel that, putting aside his services to our cause, all of you who knew him must have liked him. He was a very great friend to me, and it is with real grief that I move the following Resolution:—"That this Association wishes to record its sense of the deep loss it has sustained in the death during the past year of Mr. Digby T. Brett, its first Chairman, and one to whom, to a great extent, it owed its origin, and that the Secretary be instructed to forward a copy of this Resolution to Mrs. Brett with an assurance of the respectful sympathy of this Association with her in her grief."

Mr. Graham Anderson, C.I.E. (S. Mysore), said:—Gentlemen,—I have the honour most sincerely to support the Resolution. I feel

that I am only voicing the sentiments of all brother planters, both of Mysore and South India, when I say that we all deeply feel the loss we have sustained in the death of our first President. His name will ever remain associated with many of the improvements which have been necessary in the planting districts of Mysore, and we will always remember him with affection and respect as the first President of the Conference which was the stepping-stone to this United Planters' Association of Southern India.

The Resolution was carried in silence.

ELECTION OF OFFICE BEARERS.

Before proceeding to vote for the office-bearers for the ensuing year, Mr. H. G. Parsons said that he did not think it would be out of place to propose a hearty vote of thanks to the Chairman for the work done during the past twelve months. Though he remained in the chair to conduct the proceedings of the present meeting, he thought the present was a suitable opportunity to express their warm appreciation of the efforts and the trouble and interest he had taken in all their affairs. The more so as to his duties as Chairman he had to add, after the Hon'ble Mr. Hodgson's departure, many of the duties which would in the ordinary course have fallen to the Planting Member of Council. They had all received confidential circulars and information which plainly showed that the Chairman had exerted himself in every way even in directions where the Planting Member of Council would have had to take steps. He therefore proposed that the Chairman be accorded a hearty vote of thanks for his services during the past twelve months.

Mr. J. G. HAMILTON seconded the Resolution, which was carried with acclamation.

The CHAIRMAN acknowledged the compliment in a few appropriate words.

The result of the balloting for office bearers for the ensuing year showed that Mr. Romilly was re-elected Chairman, Mr. J. C. Abbott (Nelliampathis), Vice-Chairman, and Mr. H. Ormerod, Secretary.

Mr. ROMILLY, in acknowledging the further compliment paid him, said that he really could not thank the meeting too much for this expression of their opinion of his work. He could not quite understand the motive of their action, but he felt sure it was due more to his work on their behalf outside that room than to his feeble attempts at oratory in the room.

ADDITIONAL SUBJECTS.

Messrs. KNIGHT (Travancore) and EDMISTON (Nilgiris) asked permission to have the following additional subjects put on the Agenda paper:—Tea Duty in London. The shipments of Tea by the s.s. *Nurani*. Permission was unanimously accorded, and the subjects will accordingly come up for discussion.

THE COMMITTEE OF ENQUIRY, 1896.

This was the next subject on the Agenda paper. The Chairman, in opening the discussion, said :—

GENTLEMEN,—I thought at our last annual meeting that the discussion of the proposals of the Government of India for legislation on the lines laid down by this Committee's report would form the most important piece of work before us during the past year. As you may remember, our Member of Council, Mr. Hodgson, was told to inform us that our decision and suggestions on the report must be with the Government of Madras by the 17th August, and our letter embodying all our suggestions was signed by me and despatched before that date. But since then we have heard nothing more on the subject. H.E. Sir Arthur Havelock very kindly exerted himself on our behalf and tried to get the views of the Government of India placed before us in time for this meeting, but I received a letter from the Revenue Secretary some weeks ago saying that this would be impossible. In the meantime our labour difficulties are in our districts as great as ever. Lord George Hamilton in his financial statement lays great stress on the fact that the Indian population is rapidly increasing and that India promises in another 50 years to become one huge congested district. In the leading articles and criticisms of his speech which I have read, this statement is always prominent, and various methods of combating the evil for the time being are put forward in the shape of wider emigration and a greater extension of the facilities for allowing labour from the congested districts to migrate to where labourers are required. Surely it is a strange commentary on this statement and on these criticisms of it, and one that I have never ceased to emphasise, and that we should continue to din into the ear, that we planters, although we offer higher wages than those ruling in any other agricultural districts, cannot get a sufficiency of labour. capacity for employing labour no doubt is but a drop in the with regard to the huge increase of the population, but still th is. There is an unsatisfied demand for labour in planting dis not far remote from the congested areas. We have seen withi year thousands of coolies fed and sustained by a charity, to we ourselves, I am glad to think, contributed no small sum, we were anxiously in need of labour ourselves and willing to pa it in wages that would enable the labourers not only to live we also to lay by a considerable sum after a year's work. It is a cu anomaly and one that should give the Government of India for reflection. In my own district land is being largely opene tea and there is an increasing demand for labour. Some Sup tendents, sinking the idea of profits for the sake of turning out clearings, and unmindful of the future, have raised the rates. with what result? No new coolies from fresh districts have to them, but the old labour supply remains as it was, and testif its knowledge of our wants by lowering its standard of wor should be glad to hear from members present how they are affe in their own districts. With us, I can assure you, it is a very se matter. Our tea clearings are thriving; there is no disease s to affect our prospects of returns, and a good interest on ca would be practically assured if there was not this awful da looming ahead, that when our fields are yielding leaf in quantit shall not have the labour to pluck it. Any practical tea-pl knows what this means. It is a different matter with coffee, w work can be allowed to get into arrears if only the labour is f coming eventually; but with tea the labour must be to hand a hour required, or the whole yield for the whole year is ru There is no question of apathy amongst us; we are doing our to help ourselves, but I fear that unless Government will hel and thereby help themselves, and the country, we are powe The Committee of Enquiry, as you may remember, stated th their opinion this difficulty of procuring labour was likely to inc and not to diminish. Surely, then, it is the duty of Governm instead of deploring the possible dangers of the future, to act fo present and to try and relieve the congested districts that exist, to this small extent, by helping them to migrate to where labo required, and to help the employer by giving him some so protection in his endeavours to attract labour, and not let him as he does now, that he is merely throwing money away in irrec able advances. I should like to hear the views of other membe this question of labour as it affects their own districts, and, if scarcity is increasing with them as it is with us, then I shall that we embody them in a letter to the Government of India, urge on them once again that there should be no further dela giving us some assistance and relief. (Cheers.)

At this stage the meeting resolved into Committee to conside Chairman's request.

Resuming open meeting, the following resolution proposed by H. M. Knight (Travancore) and seconded by Mr. Parton (N Mysore) was put to the vote and carried :—"That a very st representation be made to the Government pointing out that delay in issuing orders on the Committee of Enquiry's repo most prejudicial to planters, especially those domiciled in N States and recruiting their labour in British India, and that alth the Government has frequently complained that in the conge districts insufficient, employment exists, it will do nothing to vide employment for coolies in the planting districts, althou has been proved that they are well-paid and well-treated."

CURRENCY.

The Chairman opened the discussion on this much-vexed que in the following speech :—

GENTLEMEN,—This question has been so completely thrashed in the Press during the last year that there is absolutely not new to be said in the matter of argument. When we have champions as Sir Robert Giffen in London and Mr. Yule in Calc we know that our interests, involved as they are with the prosp of India as a whole, are being advocated with (what we must cons to be) an irresistible logic. It is a misfortune that the native India themselves are so apathetic on the subject. If only t voice was raised in their own defence, a considerable deal attention might have been paid to the injustice done to them; e report of the Tea Companies during last year alludes to t diminished profit owing to the high exchange, and in the same every small cultivator, whether of coffee or other exportable prod

whether he knows it or not, is mulcted by this policy of the Government. A neighbour of mine, whose opinion I constantly ask on all subjects and who is now largely opening for tea, said to me the other day that he wouldn't mind if exchange was fixed at 1*s.* 4*d.*, as it still left him an ample margin of profit, and that it would check the extension of tea in Ceylon and in the North. I repeat this remark because I have several times heard the same class of argument; but the reply is obvious; though tea extensions will be checked here, the capital will go to China instead, especially now that the country is being developed and the waterways thrown open, and where with European management, and improved methods of manufacture, China tea may easily retrieve its former position in the trade. This is no vague prophecy, for the same thing has already actually occurred in the opium trade, and with respect to other countries in the matter of coffee. At this time last year, we producers stood practically alone in our avowed opposition to Government, but since then a great change has come over the whole aspect of affairs. The scarcity of money and the consequent high rates of interest bringing financial disaster in their train caused all the Chambers of Commerce to protest against the policy of Government, though they advocated different remedies; then came the appointment of the Committee of Enquiry and Sir James Westland's new proposals, a scheme which has this to be said for it, that it is the only scheme so far that I know of that has met with unanimous condemnation and this itself ought to engender distrust of the Government of India's financial capabilities. Great opposition has been shown at Home to the constitution of the Committee as being picked and unrepresentative, but personally I cannot help thinking that with Sir Henry Fowler in the chair we are sure to have a fair and impartial hearing. I am glad to think that though the North of India was slow to move, the European producing interests throughout India and Ceylon show one solid front, and, as I said before, it is only a pity that the native producers of India have not joined hands as their neighbours in Ceylon have done. Mr. Acworth was to give his evidence on the 12th, and before that he was to have a meeting in London with Mr. Christie, Mr. Robert Elliot, Mr. Hodgson and others. Mr. Christie had already given his evidence, which lasted for a day and half. I hope we shall hear the result by this Mail, but if Mr. Acworth has written direct to me instead of to the Secretary, I shall not get his letter in time for this meeting. At any rate, we owe him a debt of gratitude for taking up the matter with his accustomed energy and giving up a deal of time during his well-earned holiday towards advocating our interests. Of course nothing more can now be done by us, but to await the finding of the Committee. But I venture here to express my own humble opinion that Mr. Yule in his speech the other day at Calcutta was right that in time the policy of open mints will again win the day. "Naturam expelles furcâ tamen usque recurret." Government may again try to keep up the fictitious value they have put on their own silver by some new device, but it will no more stand the test of experience, as shown by the prosperous trade of the country, in the future than it has done in the past. Our hope must be that in the interim our crippled industries will not be crushed out of existence.

Mr. GRAHAM ANDERSON, C.I.E., then spoke as follows:—

GENTLEMEN,—The Association whose interests I have the honour to assist in representing has studiously refrained from doing more than cordially endorse the Resolution passed in 1895, which while expressing contained approval of the Memorandum on Currency drawn up by the Wynaad Planters' Association and incorporated, as an appendix, with the Proceedings of the Planters' Conference held in 1894, emphatically disapproved of the attempt to give an artificial value to the rupee by the closing of the Mints and reserved further action until such time as an appreciable effect should follow the measures adopted. The silence which our Association has considered itself bound to maintain has been all the more irksome, as during the last three years in succession coffee crops have been most disastrously affected by faulty distribution of rainfall at the blossoming season; the trade on the Western Coast has gradually become utterly disorganised by the continuance of the plague in Bombay, and during this last year the prices of coffee in the London market have fallen fully 25 per cent. In addition to all these troubles, the critical state of financial pressure throughout the country has depreciated all classes of securities; discouraged the retention of loanable capital in the country; raised the rate of interest to an unprecedented extent; rendered competition with other silver-using countries ruinously disadvantageous, and made the finance and general conduct of all agricultural enterprises matters of the gravest concern to those engaged in them. The subject of Indian Currency is such an appallingly difficult one, that I shall have to keep at a great distance from the vortex of discussion, but there are so many important interests, one intertwined with the other, that in bestowing even a superficial glance at them, each must claim a fair share of respectful attention. I sincerely trust, therefore, that I may not be charged with presumption for the humble remarks which I am about to make and which I venture to think are necessary to afford evidence that I am not unduly prompted by selfish motives. The Press of India has nobly and unswervingly done its duty as a trusty counsellor, advocate and guide during a time of unparalleled difficulty, with the result that the sympathy of all the most influential organs of public opinion at Home has been enlisted in the cause of Currency reform in India. Even the drastic remedies proposed by the Government have undoubtedly had a beneficial effect, as they have been the means of concentrating the attention of all the leading experts in India and England on the vital necessity of providing a suitable remedy for existing Currency difficulties which are now clearly realised as grievously injurious alike to the interests of Government and the commerce and industries of the country. The various Chambers of Commerce with their vast experience have given emphatic expression to their matured views and conclusions, and the Government has submitted the consideration of the whole subject to a tribunal which can derive every possible assistance in its deliberations from the most eminent experts in financial, commercial and industrial affairs that are available in London. It has been truly stated that there is nothing which is less clearly understood than the enormous difficulties experienced by the Government of India, or the incalculable benefits which have resulted to hundreds of millions of its subjects in the form of peace, progress and prosperity from the purity and general excellence of its administration. It may be stated with equal truth that there are many both in India and in England who do not rightly appreciate the fact that India, so far as the masses of its population are concerned, is essentially a poor country, and that the great show of wealth which formerly existed in temples and places was simply the centralised results of "ceaseless wars, rapine and extortion," which ceased when a strong civilised power took upon itself the duty of establishing a settled and benign form of government. The London *Times* has most clearly indicated one of the principal difficulties of the Government of India by stating that it has to arrange for the maintenance of perfection in its administration, and to discharge large gold obligations in England out of a revenue which is purely Asiatic in character. These obligations, it is well known, are principally for interest on the debt incurred for the construction of railways and other reproductive works, which in addition to stimulating industrial progress in the country have proved so invaluable in times of war, scarcity and famine.

Although the economy of the Government may have been often impugned, still the fact remains that with a revenue which per head of population is less than one-third of the water-rates in London, it has provided its subjects with land to cultivate, roads, railways, irrigational works of colossal magnitude, schools and hospitals, besides everything else which is necessary for the promotion of happiness and security. It is not, therefore, its fault if fiscal arrangements have been made consistent with such administrative requirements, or coincident with the immense development of commercial and industrial activity, but it is certainly its misfortune to have to discharge duties and obligations of great magnitude and variety with its Currency depreciated to two-thirds of its original value owing to the over-production of silver. These facts are well known to all who have attentively studied the changes which have been gradually taking place in the country, but they are of the utmost importance when glancing at the subject of Indian Currency. In a recent article in the London *Times* this subject was described most accurately as one in which the interests of Government, the British manufacturer, the Indian merchant and the Indian producer are in constant conflict, and which, as a problem, is not only complex in itself, but involves far-reaching and most important consequences to the Government and the commerce of the country. It is specially in regard to this conflict of interests that I desire to say a few words which I could not have ventured to do if the situation had not been desired by the greatest journal in the world. Although the fact mentioned seems, at first sight, an appalling one, the conflict is simply the natural result of circumstances which the parties concerned are powerless to deal with individually, each being dependent on the other. The Government cannot fulfil its obligations

with an attenuated revenue, and having large good payments to make in England "desires to do so with as small a number of rupees as possible." "The British manufacturer and the Indian merchant in British goods naturally desire to keep up or raise the sterling equivalent of the rupee." Agriculture, which supports the principal industries of India and contributes the principal item to its revenue, is itself dependent on the proper amount and distribution of rainfall, and those who are engaged in it keenly feel the disadvantages under which they labour when competing with other silver-using countries which have not an artificially enhanced Currency to handicap their operations.

On the 7th June the Secretary of State for India graphically sketched the difference between the Indian and Home revenues as follows:—"Those who take an interest in the difference between our fiscal system and the fiscal systems prevailing in India will know that a much larger proportion of taxation in this country is raised by indirect means than in India, and that here, owing to the greater wealth of the community, they consume a much larger proportion of those taxable articles which, if not included under the head of luxuries, lie in the scale between luxuries and the necessaries of life." This authoritative pronouncement is of the utmost value, as it clearly indicates the lines upon which future action must be taken. There is really such a very small margin of difference between the amount upon which an Indian ryot can subsist in comfort and that which constitutes abject poverty that it is almost impossible for those who have not lived for many years among the peasantry to realise or appreciate how easily their interests may be injuriously affected.

In continuing his masterly address the Secretary of State said:—"The higher the exchange value of the rupee, the less is this 'Loss by Exchange,' and the lower the rate, the greater the loss." These are the consequences experienced by Government, but every local industry and every cultivating peasant experiences consequences precisely the reverse. And continuing, he said:—"Does not India offer a wonderful field for private enterprise and the investment of private capital? In India there is a very great population, frugal, industrious and orderly, a prolific soil and a large amount of mineral wealth practically untouched. I will not take part in any controversy, but if, however it is done, people could be assured that they would get back from India the value of the money they had invested there, I believe it would effect an economic and industrial revolution in India."

Referring to a Memorial from the Bombay Chamber of Commerce, asking that measures should be taken "to amend the critical state of financial pressure throughout the country," which was attributed mainly to the contraction of the Currency, the India Government in a letter to the Secretary of State writes:—"We take occasion to note what while we fully realise the great disadvantage to commercial operations in the existence of a discount rate ranging as high as 10 or 12 per cent., we are not inclined to agree with the Chamber that such stringency is the direct outcome of actual scarcity of the Rupee Currency. We think that one prominent cause which contributes to the stringency is the transfer of capital from India and the impediment to its flow to India from England, due to the distrust of the future of the rupee."—*Economist.*

"It is held by many experts, we believe, that as regards the scarcity of rupees *versus* scarcity of loanable capital, the truth is that India has suffered from both, though Lord George Hamilton and Sir James Westland contend that the scarcity is only apparent in the case of the latter."—*Madras Mail.*

The above extracts more than clearly manifest the difficulties of the situation and the causes to which they are attributable. Agriculture, of all other industries, is the most sensitive to depression, stringency, or disturbance of the money market, which are embarrassing to everybody engaged in trade or commerce and discourage the retention of loanable capital in the country. The free use of capital is indispensable to the development of India's resources, and any thing which restrains or restricts its use is calculated inevitably to prove disastrous to its economic prosperity. The enormous increase in the population of India and the almost entire dependence of its people on the soil are rapidly becoming matters of supreme concern to the Government. The whole subject of the Currency arrangements is fraught with difficulties of the gravest description, and the proposals of the Government to melt down rupees annually so as to still further artificially enhance the value of the remainder have been emphatically represented by the Bombay and Calcutta Chambers of Commerce in Memorials dated 13th and 18th June, respectively, as calculated to increase rather than to mitigate the critical tion of affairs now existing. For these most cogent reason Association whose interests I have the honour to assist in repr ing joins in most earnestly deprecating the proposals referr and further regrets that it cannot endorse the suggestion President of the United Planters' Association of Southern Indi tive to the introduction of an Export duty. Its members de absolutely refrain from attempting to suggest any remed difficulties which are of such magnitude and complexity, affe as they do the interests of the Government, its people an commerce of the country. The whole subject is now engagin attentive study of the members of the Currency Committee will have to decide what measures are best calculated to su interests of all concerned, and I am enjoined to express a fe hope that the welfare of agriculture, which is the mainstay of will receive every possible consideration, seeing that it contri the largest item to the revenue of the country, affords the pri support to its railways, provides congenial employment to the of its inhabitants, and creates nearly the whole of its exports

Mr. W. H. SPROTT said:—I do not know if the members o U.P.A.S.I. have seen the Government Blue Book of the Corres ence respecting the proposals on Currency made by the Go ment of India. It seems to me we have taken a very bold and u course in the letter of the 14th February, 1898, from the Chai of the U.P.A.S.I. to the Secretary to the Government of Finance and Commerce Department. We there state that i opinion the true solution of the present difficulty lies in the re- ing of the mints. Surely this is rather a bold statemeut on the of a body of Planters to make to Government, and one wh directly opposed to the opinion of experts and the Govern policy. At present the result of having an unstable curr in the country is that there is no money in the country Bank rate has gone up, and no money can be got for adva very great inconvenience is caused to everybody and tra practically brought to a standstill. Surely it would have better for us to have followed the policy of the Bombay and Cal Chambers of Commerce and advocated the establishment of a s currency in the country with as little delay as possible, instea committing ourselves to advocate a policy which is directly opp to Government, and can only tend to weaken our influence. I address he points out how trade has been hampered by the vi fluctuations of the currency, and that the trade of India would tinue to be hampered with them unless a gold standard was i duced. What we want is that our interests should be prop considered and weighed, and the best course adopted for the fu of India generally, and I think it is a great pity that we sh advocate any specific policy which, for the moment, looks to b our advantage, but which will, no doubt, bring ruin on the cou and cause an enormous increase of taxation, and probably in the be disastrous to us.

Mr. H. G. PARSONS said:—I presume the resolution before meeting has reference to a vote of thanks to Mr. Acworth for time, trouble, &c., he has taken in carrying out, to the best o ability, our views with regard to the Currency question. I am prepared to second the Chairman's proposal of a vote of thank Mr. Acworth for all he has been doing. At the same time, I th it is quite right that you should hear those of us who do not gether agree with the policy that has been indicated. I should say that our Association has distinctly instructed us to say th mistake has been made—and in saying this I think we are, certain extent, in agreement with what South Mysore has said proposing a definite remedy as to how the question of a fixed rency should be met. We quite agree, and, from our own poin view, it is clear that the lower the rupee goes, the better it is for but we don't think it is possible ever to expect that it will fa low as it might if Government would let it alone. What our A ciation admits, what we all ought to admit, is that a fixed excha is the best thing for us, and to that extent we must extend assistance to Government. When I say that our policy shoul to agree to fix exchange, I mean that we should use all our ener to insist that the rate fixed should be low enough not to materi interfere with the agricultural and producers' interests and so ham the trade of the country. The Government has given us the imp sion that it wants to fix exchange at 1*s.* 4*d.*, and I presume from own point of view and that of the other producers of India that would hamper the trade of the country generally. But how value of the rupee should be fixed, I think, is a question that sho

e left entirely to those experts who have been giving the matter lmost a lifetime of consideration. I think from the last two para-raphs of Mr. Christie's pamphlet he is very much of the same ind as our Association. In having made these remarks I distinctly ish you to understand that we do not in any way propose a vote of ensure on what has been done. What has been done has been one; but we only desire to state publicly what are our views on his matter.

Mr. ROBERT GOMPERTZ (Shevaroys) said that he disagreed very nuch from what had been said by the two previous speakers, that he matter should be left entirely to experts. He thought the experts vere quite as much divided in opinion as the planters themselves. Mr. Acworth, he thought, had suggested a good way out of the difficulty, namely, by a sliding scale. The loss to Government if the Rupee fell to 11*d.* was estimated at 15 crores; but as part of this loss vas already covered by taxation, it was only necessary to consider ow the balance should be met. Producers were quite willing to ave an export duty placed on their produce, provided that if the Rupee rose in value or the export trade increased, the duty should e proportionately reduced. The exports of Ceylon should be taxed o a like extent. If this were done, he (Mr. Acworth) goes on to say he whole tax so raised should be spent on the producers themselves n improving communications, extending railways, etc. This was, e (Mr. Gompertz) thought, a decidedly good position to take up, nd should receive their warmest support. With regard to the last wo paragraphs of Mr. Christie's report, dealing with the proposal o re-open the mints, on which he said the sudden drop in the Rupee to bullion value would be a revolutionary step which would eave Government in a position of grave anxiety with regard to its terling payments, Mr. Gompertz said that when Mr. Christie wrote hat he could not have seen Mr. Acworth's proposal regarding the liding scale which would relieve Government of all anxiety. In November, 1897, he wrote to the Chairman suggesting that Govern-ment should be asked to re-open the mints and to cease to tamper with the Currency, at the same time protecting its servants from hardship by paying all who were engaged in Europe, or who had a European domicile at par, or at such lower rate, as 1*s.* 8*d.* or 1*s.* 9*d.*, as might be considered just or equitable. The sum that Government would be out of pocket by this arrangement could probably be raised without the slightest difficulty by increased taxation which the expansion of the export trade and the increased prosperity resulting from a depreciated currency—or rather from the removal of the crushing handicap which was strangling the country—would enable the people cheerfully to pay. He went on to say that if Government would do this, they would be prepared to bear their share of the burden by accepting an export duty of 2 per cent. for every penny that exchange might fall below 1*s.* 4*d.* If the proposal was adopted, taking produce worth £100 in each for facility of comparison, the producer would get the following amounts:—

Exchange.	Export Duty.	Result.
s. d.		
1/4 = Rs.1,500	Nil	Rs.1,500
1/3 = „ 1,600	2%	„ 1,568
1/2 = „ 1,714	4%	„ 1,645
1/1 = „ 1,846	6%	„ 1,735
1/- = „ 2,000	8%	„ 1,840
-/11= „ 2,182	10%	„ 1,964
/10= „ 2,400	12%	„ 2,112

From the above it would be seen that if the Rupee fell to 10*d.*, which seemed quite possible, they would, after paying the Export Duty proposed, get Rs.2,112 instead of Rs.1,500 for every £100 worth of produce. The lower the Rupee fell the greater would be the loss to Government, the greater their taxation, and the greater their gain. As this would affect every single article exported to exactly the same extent, every single producer would equally benefit and *pari passu*, by the increased export duty, so would Government. They did not want, as some had supposed, to benefit at the expense of the tax-payers; they simply required that the crushing handicap under which they groan should be removed so that they might compete on equal terms with other silver-using countries. The only persons at whose expense they might be supposed to benefit by the re-opening of the mints were Government and Railway servants, having expenses which must be paid in gold. With regard to Government servants he had already made a suggestion: with regard to Railway servants, the increase in traffic would enable the companies to pay at the rates fixed by Government for its servants. All would benefit except those who were in receipt of fixed salaries. It had been thought by some that if the Rupee fell to its bullion value exporters would not profit much because prices would rise. But this was a misconception, because if the price of grain rose the area under cultivation would be bound to increase, and eventually it would be found there would be no great increase in prices. Mr. Gompertz then went on to show, from his experience, that the decrease in the purchasing value of the Rupee had not been contemporaneous with the fall in exchange, but, as in most countries, had been determined by the needs of a population advancing in civilization, etc.

Mr. J. W. HOCKIN was the last speaker on the subject. Before the meeting resolved into Committee he said:—

MR. CHAIRMAN,—As our views on Exchange are being laid before the Currency Committee in London, there is no necessity for us to expound them at length here. I think, however, it may be of use to comment on the peculiar line of argument adopted by our opponents, both in London and in the local Press. It is simply this. When confronted with facts previously unknown to them, they retort:—Why you planters are simply fools,—other more opprobrious epithets were used locally—you not only don't understand the question, but you don't understand your own business, or what is good for you. Though abuse is no argument, it might have had a misleading effect, had not our opponents endeavoured to justify the arrogant tone they adopted, and, in so doing, made statements which every planter of any experience knows are absurd. For instance, in the *Economist*, "an East Indian Merchant" maintained that Java could not be quoted as a country hampered by a fixed high Exchange, on the ground that the extension of tea in Ceylon is due, not to low Exchange, but to the blight of coffee; and on the ground that tea cultivation has not materially increased in Java, because that country has not suffered from coffee blights. To support the last statement, he quoted the increase of Java coffee exports from 515,000 piculs in 1888 to 767,361 piculs in 1897. He is apparently ignorant that Java exports of coffee were 1,767,000 piculs in 1883; were reduced to 515,000 piculs in five years by the ravages of leaf disease; and only increased to 767,000 piculs in the next nine years, because Liberian had been largely planted up in place of the exhausted Arabica variety. Yet, this is the merchant who ventures to taunt the London Secretary of the Ceylon Planters' Association with ignorance of the history of his industry! Locally, we were told that statements about the Brazil coffee industry compiled by Rio merchants, and printed in trade reports, open to anybody with a sufficiently large business to be in the way of receiving such reports regularly, were baseless assumptions because our critic had not previously heard of them. We were told we were being taught details of our industry, familiar to us from our infancy in business, because our critic had apparently just discovered them himself, and thought they were equally new to us. We were informed that the price of tea had gone down to 5*d.*, when the quoted price in London was 7¾*d.* per lb.! We can assure our critics it is just as dangerous in planting matters for outsiders or novices to try and teach men who have studied their industry for a quarter of a century, or more, as it is in every other line of business. There are many things that can only be learnt by a personal experience of business. There are plenty of men both in India and Ceylon who have not only had that experience, but have studied the planting industry all over the world in the numerous publications devoted to it, and also when travelling. We have now the elected representatives of planters in North and South India and Ceylon unanimous as to the effect of Exchange on their business. The mill-owners of Bombay are also arranging to give evidence, much on the same lines. Surely it is safer and wiser to suppose this mass of business men know their trades better than merchants, political economists, and amateurs? I can't agree with the gentlemen who urge we should not suggest any remedy, for the *Times* (London) says that one of the difficulties of the position was that producers had not suggested any feasible remedy. We have proposed a feasible remedy and it was acquiesced in by a well-known writer on the subject in *Capital* as the only true solution of the problem. Then, there is the argument about the unfair gain of the employer at the expense of the employee, which even Lord Farrer and the Government of India are not ashamed to urge. Anyone who knows anything about the plantation cooly knows that he has far more power to cheat his employer than the employer has to cheat him; that what cheating goes on (and there is a good deal in certain districts) is all done by the cooly, and any employer who dared to retaliate would soon be left without a cooly. This argument about our illicit profits has been a little complicated of late by an attempt to prove that we make no profit by low exchange; that the whole thing is an illusion. If so, this disproves the charge of unfairness, but later our critic seems to admit it is only, if things were as they ought to be, and not as they are, that the profit would

disappear. As we have only to deal with things as they are, we may leave other conditions out of consideration, and assume there is a profit. As to its fairness, I will quote what a well-known writer in *Capital*, who is certainly not a planter, says on the subject: "What an empty argument it is to talk about the illegitimate gain of the planters and producers! Do we hear the natives of the country—and they are the chief people to be considered—talking in this fashion? Never? When exchange goes down, does the merchant pay his manager more? Does the Bank pay its employees more? Do mill managements raise the wages of their hands?" He admits that Government compensate the higher European employees, and perhaps some mercantile concerns do compensate the same class, but neither Government nor mercantile concerns compensate the mass of their employees. If not, if no business in India is conducted on these principles, why do our critics talk in canting terms of the unfair gains of the planter by exchange? Is it in the hope that by throwing much mud some may stick? The writer in *Capital* accurately sums up the position when he says:—"To assail the planter with the rubbishy cant of moral economics is simple disgusting!" If any unfair gain is made at the expense of the cooly, and none such has been proved, or is probable, seeing how independent he is, it is the British public who get it in an undue lowering of the price of tea. As far as the cooly goes, the more rupees his employer gets the better for him, as he is sure to get more than his fair share of them. Just now he is in danger of getting fewer rupees, as owing to the forcing up of exchange Ceylon planters are actually advertising for offers to take coolies off their hands,—a thing never heard of since the ruin of coffee in Ceylon.

Again, we are told that the prosperity or adversity of industries is settled by other conditions, and exchange has never had any influence on them. We all know that the conditions of trade are ever varying, and success in business depends on a just appreciation and clever balancing of various adverse and favourable influences as they arise. But why should the rate of Exchange be the only influence to be neglected? Especially when the variations from a par rate are greater than have ever been known before, and past experience can give no guide as to their effect. The Brazilian lately has been getting the equivalent of Rs.40, the Chinaman and other silver-using people the equivalent of Rs.22 to Rs.24, while we get only Rs.15 for every £1's worth of produce sold in European markets. Does not this enable them to produce at a gold price which will ruin us, other things being equal? Fortunately, as yet other things are not equal; but Brazil is affecting our coffee prices, and the great European nations are striving to put China in a position to affect our tea prices. Supposing a ship springs a leak in mid ocean, given time and material the leak can be cured, the ship brought into dock and made as good as new. But, if a gale of wind arises as soon as the leak is sprung, that ship will be lost. Blights and the lowering of prices by competition are leaks we have to be always stopping. The former can only be overcome by high cultivation, and the latter by an increase of silver prices to balance the fall in gold prices. But just now Government is raising a gale of wind by forcing up exchange, which will prevent our stopping our leaks by taking away the extra rupees we have been devoting to that purpose. Which is the primary cause of the loss of our ship if she founders,—the leak or the gale of wind? The gale undoubtedly, as but for it the leak could be stopped, nor is India peculiar in having leaks, all countries are liable to them as all ships are. But India is peculiar in that it is the only tropical country the Government of which is forcing the rate of foreign exchange far above the level of that of her competitors. I need not enlarge on the fact that our interests are the interests of the country at large, although Government have disputed it. Because it is well known that an enormous majority of the population depend on agriculture, and the only hope of an immediate increase in that industry is in the growth of produce for export; the welfare of the import trade depends on the ability of the producer to buy imports; and the London *Times* has admitted that, if our views can be maintained, they must ultimately dominate the position. We may be sure Messrs. Acworth, Hodgson, Elliot and Christie may be relied on to drive our arguments home. As for the advantages our opponents hope to gain by fixing exchange at 1*s.* 4*d.*, they are said to be security to trade from the absence of violent fluctuations of exchange; cheap capital to develop the country; and a good rate at which to remit to England fortunes acquired in India. No all classes, planters as well as others, would welcome a fixed exchange if one rate could be secured for all tropical cou though I am told by a successful merchant in a large way o ness the effect of fluctuations by exchange on trade are much gerated. But a handicap of 50 per cent. or more in our rivals' is too high a price to pay for fixed exchange. It is probab Exchange Banks would remit their capital back to India, if exc were fixed. But Bank capital to finance trade is of little use, there is a larger capital behind it to promote industries. such industries can be worked at a profit, capital will not g them in India but into other countries, where circumstance more favourable, the competition of which will still further de India. Nor can fortunes be remitted before they are made, an cannot be made unless profits are good and general. A proof inherent rottenness of all schemes for tampering with the Cu is to be found in the way the doctors are quarrelling wit another: Government will have none of the merchants and ba schemes, and the latter are aghast at the way Government pr to chastise them with scorpions instead of whips as hitherto. us hope the result will be either a return to open mints, or Exchange fixed—if any such fixing is possible—at the averag ruling in tropical countries. This Association, at least, ha flinched from pointing out the only way a return to a sound rency policy can be effected. This is, by offering to submi small direct export duty in place of a heavy indirect one, w only of a South American Republic.

At this stage the meeting resolved into Committee, an adj ment for the day being made at 4-15 P.M.

SECOND DAY.

BANGALORE, *9th August.*—The delegates met again to-day at l and sat till 1-30 P.M. The following business was transacted :-

CURRENCY.

The Committee stage of the discussion on this subject was resu when Mr. R. Gompertz withdrew the resolution he proposed evening.

When the general meeting was resumed, the Chairman annou that the Secretary had received by the mail a copy of the state of the Planting Member of Council on the Currency question was to be put before the Committee that was sitting at Home. presumed, therefore, that the Hon'ble Mr. Hodgson was going examined as a witness after all.

FINANCES.

Except a resolution passed in Committee with regard to an a cation by the North Mysore Native Planters' Association, the co eration of this subject was deferred to the last day, because it impossible to decide anything until it was known what appro tions, if any, were going to be made from the Reserve Fund regard to the question of providing an Agricultural Chemist, &

EXPORT DUTY ON BONES.

This was a subject that was brought up at the last annual mee by Mr. O. Scot-Skirving, N. Mysore, when a resolution was p instructing the Secretary to address the Government of Indi the subject. It will be seen from a paragraph in the Secret Report that this was not done, for reasons which will appear be

Mr. PARTON (N. Mysore) said he had been instructed by his A ciation to again support this subject, but he could urge no fu arguments than those which had already appeared in its favour.

Mr. H. G. PARSONS (Coorg) asked if there had been any fu correspondence since the resolution passed last year upon which meeting could now act.

The CHAIRMAN:—None whatever.

Mr. J. W. HOCKIN:—We passed a resolution last year to ad Government on this subject. The Government has not addressed. Why should we not carry out that resolution this and draft a letter on the arguments brought forward last year?

The CHAIRMAN in reply to Mr. Hockin made the following e nation:—The Secretary had after the last annual meeting wr to Mr. Scot-Skirving and had asked him if he would give a li

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

argument on which the proposed letter to the Government could be based. Mr. Scot-Skirving did not reply, and in consequence the letter to the Government of India had not been sent. Also, the whole question had been complicated by the fact that while dealing with the currency problem they had suggested that a general export duty should be imposed.

ENCASHMENT OF CURRENCY NOTES.

Mr. R. GOMPERTZ (Shevaroys) introduced this subject. He said that last year the Shevaroys Association had requested the United Planters' Association to support them in a letter they had written to Government advocating the encashment of Currency Notes without a premium at all Government Treasuries and Sub-Treasuries, and the United Planters' Association did take action upon it. The Secretary in his Report had said on this subject that the Shevaroys Association was dissatisfied with the partial success it had achieved and now brought the matter up again. He (Mr. Gompertz) begged to say that they had met with anything but partial success. Last year the matter stood thus. The Government was prepared to cash Currency Notes on the Shevaroys provided it was paid a commission of $\frac{1}{4}$ per cent. Now it absolutely declined to cash Currency Notes at any premium whatever. It had granted them instead Supply Bills, and a more cumbrous and irksome device for meeting their wants he had not heard of for a long time. The speaker then proceeded to read at length the letter which he had sent to the Government last year on this subject, and which was read at the last annual meeting of this Association. That letter, he said, was written so long ago as the 17th July, 1897, and no reply had been received until May, 1898, when a G. O. was received which merely summarised his arguments, but in no way met them; but concluded with the statement that His Excellency the Governor in Council after a careful consideration of the correspondence on the subject approved of the suggestion to issue Supply Bills at Yercaud at one-eighth per cent. He then received a letter in the beginning of May informing him that the system of Supply Bills would come into operation on the 15th May. He wrote immediately to the Accountant-General, and said that the notice given for the introduction of this system was too short for the planters to make their arrangements, and asked that it might be extended by a month. In reply all the concession they got was an extension of 15 days. He again addressed the Accountant-General stating that they still objected to pay any commission on the encashment of Currency Notes, but since their objection had been over-ruled, they cordially accepted the decision of the Government, but saw no reason for the restriction being more irksome than was necessary. Therefore, instead of adopting the Supply Bills scheme, they were prepared to pay the premium sanctioned by Government for the encashment of Currency Notes. The Accountant-General in reply obviously lost sight of the position which had been taken up by his predecessor, and said that Government could not charge commission for cashing its own notes. This, therefore, was a new phase of the question, and the Accountant-General had the effrontery to state that it was quite a mistaken idea to suppose that commission could be charged. Mr. Gompertz wrote once more to say that since the Accountant-General insisted on having the Supply Bills scheme, he might meet planters so far as to empower an officer in charge of the Treausries to issue the Supply Bills. That, however, was not done, but Deputy Collectors were empowered to issue these Supply Bills and, in consequence, the Deputy Collectors of the Nilgiris, Coimbatore, Salem, and Madura were empowered to issue these Supply Bills. To add to the inconvenience a gentleman had complained that he had asked for a Supply Bill for Rs.400 odd, but was refused on the ground that Supply Bills could not be issued for a smaller sum than Rs.500. In reply to a communication from him on this subject, the Accountant-General wrote that the Rs.500 minimum limit for Supply Bills only applied to Yercaud; in other places the minimum was Rs.1,000. Matters now stood as follows with them. They could not, in Yercaud, get Supply Bills for any sum less than Rs.500, and they could not at any premium cash their Currency Notes. This appeared to him a most suicidal policy on the part of the Government. It was proposing to contract its currency by withdrawing as much as 6 crores from circulation, and it would seem its bounden duty to make this course popular, and the best way to do so would be to make its paper readily convertible. But as he had said, at Yercaud, instead of their Note being readily cashable at annas 2 and 4 per Note, they were not cashable at any premium. He trusted that the U.P.A. would agree with him in suggesting that a memorial should be drafted, pointing out how suicidal it was on the part of those who controlled the currency to render their Notes unpopular.

At this stage the meeting went into Committee to consider the question, when the following resolution was arrived at:—"That a memorial be submitted to the Government of India praying that Currency Notes may be made cashable at all Government Treasuries and Sub-Treasuries." The resolution was on the motion and seconding of Messrs. Gompertz and Hockin, respectively, affirmed in open meeting.

CLASSIFICATION OF COFFEE.

This subject was brought forward by Mr. Graham Anderson, C.I.E., in the following speech:—

GENTLEMEN,—Having in my remarks on Currency arrangements mentioned the effects of the extreme stringency in the money market, the difficulties arising from competition of other silver-using countries which have not an artificially-enhanced Currency to handicap their operations, and the alarming fall in prices in the London market, I desire to point out that some slight alteration in telegraphic advices appears desirable to facilitate financial calculations generally. The distinguishing characteristic of quotations and sales of coffee during the last season was the abnormal and most serious difference in the prices for the various sizes of plantation coffee, which had the effect of lowering the average price of even the very best descriptions to a figure which has seldom been touched before. In no country in the world is there more care or attention bestowed on the preparation of coffee than on the plantations of Southern India, and when it is remembered that all the sizes in each consignment represent the produce of the same trees, gathered within the space of, perhaps, only a few days, pulped, washed, dried and prepared by the same staff, on the same plantation, and peeled, sized, garbled and bagged by the same Curing Agency on the Coast, this great difference of price for the various sizes is naturally a very great disappointment to all Planters, more especially when occurring in regard to an article which is sized simply to facilitate roasting, which is followed by grinding to powder, which is subsequently blended and sold at prices which do not vary in accordance with those of the unroasted product. This alarming fall in the price of No. 2 and No. 3 means a most serious loss to the producer and a huge extra profit to the middlemen and retail trade, and as such deserves the earnest attention of all Planters and the Merchants and Brokers to whom their produce is consigned. For some time past, owing to this altered position of affairs, we have all experienced great difficulty in making forecasts on the authority of either circular advices or telegrams. We are one and all very grateful to Reuter's Telegraphic Agency for the information which is daily afforded in the newspapers connected with the prices ruling in the London market, and I feel perfectly certain that the Directors of that Agency will accord sympathetic consideration to any suggestions which have for their object the adoption of some simple alteration in the method of quoting prices, which while giving their establishment no extra trouble, would add most appreciably to the benefits which they at present confer on the Mercantile and Planting communities. Messrs. Sanderson and Co.'s Market Report for the month ending 12th May, 1898, affords a graphic account of the state of the Coffee Market, and clearly indicates the reason for the alarming fall in prices. We read that "when the market opened on the 14th April after the Easter holidays, extensive supplies were catalogued comprising a large proportion of Costa Rica, Guatemala and other Central American descriptions as well as East Indian and Columbian." "In the meantime, old crop coffee continues to arrive on too large a scale, and accumulation of stocks, such as has never before been seen at this time of the year, would have taken place, had not the fear of war between Spain and the United States caused the Americans to buy largely, owing to the apprehension of a tax being imposed. Enormous purchases of both Rio and Santos were made, and at the same time holders in America sent large quantities into the interior. This accounts for the heavy deliveries and may, in the future, act against a recovery in values."

In another portion of the report special mention is made that the "present system of dealing with the sales in London is quite inadequate," as the East Indian and Central American Crops "are being marketed at the same time." The arrangement of quotations for such an immense quantity and variety of coffee must be a work of a most trying character. In order to obtain the concession we desire, it will be necessary to address some of the leading brokers in London, respectfully drawing attention to the difficulties experienced in India in the matter of forming reliable conclusions as to the ruling prices

and prospects of the market generally, owing to the redundancy of terms which are used in describing the quality of the various classes of coffee and the frequent interchanging of these terms without regard to their technically-accepted meaning. I refer specially to the terms middling and medium; but to these must be added good average, good, fair average, fair, bold, bold medium to fine, middling to fine, good, and good ordinary, etc. The difficulties arising from the frequent interchanging of these confusing technical expressions are most materially increased when they are indiscriminately used in connection with the various classes, grades, kinds, sorts, descriptions, qualities, lots, batches and parcels of coffee entering the London market. To illustrate my meaning, I quote at random from a circular advice, dated 10th June, and a telegram, dated 1st July, both of which came to hand about the same time:—

(TELEGRAM.)

East Indian Descriptions.

Good middling average (B) size	97
Nilgiri average (B) size	65
Wynaad	64
Middling Ceylon	103
Medium Mysore	75

(CIRCULAR ADVICE.)

	s.	s.
Plantation Ceylon, middling to good middling	94/	106/
Nilgiri (B) size	67/	85/
Wynaad	64/	76/
Coorg	70/	97/
Travancore	63/	76/
Mysore (B) size, good to fine	32/	101/

Now, we will suppose the finance of an estate has to be arranged for in India on the prospects of the sale of a large consignment in London. Such telegraphic information would be absolutely useless for any calculations, and I feel sure if this matter is respectfully represented to some of the leading London Brokers, they will gladly do what they can to afford more precise and useful information to the Telegraphic Agencies, and thus confer a great benefit on their Planter constituents in this country.

The following resolution was moved by Mr. J. A. Harris (S. Mysore), seconded by Mr. H. G. Parsons (Coorg), and carried unanimously:—"That this Association do forward copies of Mr. Anderson's memorandum on the classification of coffee to Messrs. Mangles and Sanderson for favour of such action as they may deem desirable."

TEA DUTY AT HOME.

Mr. H. W. KNIGHT (Travancore), in introducing this subject, said he did not wish to add any more to what he had said yesterday in Committee with regard to the subject of the reduction of the import duty on tea into Great Britain. All he would do now would be to propose the following resolution:—"That this Association through its representatives, Messrs. Sanderson and Mangles, do urge upon the Indian Tea Association in London the urgent necessity for inducing Government to reduce the import duty on tea into Great Britain, and suggest that strong representation should be made in conjunction with the Ceylon Tea Association in London."

The resolution was seconded by Mr. W. L. Edmiston (Nilgiris).

Mr. BOLTON (N. Mysore) said that the only point in connection with the resolution which struck him was whether the effect of reducing the duty on tea would not have a counterbalancing effect on coffee. The cheapening of tea might have the effect of lessening the consumption of coffee, and that being the case, the resolution might be one that would affect the Association as coffee planters.

Mr. GRAHAM ANDERSON said that with regard to what had fallen from the previous speaker, the only salvation for East Indian Coffee lay in a heavy import duty, thereby keeping out Rio coffee and other lower grades from competing with it on ruinously cheap terms. If anything was done to lower the import duty on coffee, it would be prejudicial to coffee planters. Moreover, people had such confirmed tastes with regard to tea and coffee that he doubted if the effect of reducing the duty on tea would have any effect on the consumption of coffee.

Mr. W. L. EDMISTON asked Mr. Bolton if he had ascertained whether the recent reduction of 33 per cent. on the import duty on tea had made any difference on the consumption of coffee at Home.

Mr. BOLTON said he had no information on the subject.

Mr. GOMPERTZ said that the U.P.A. was an Association of Associations, and it was scarcely seemly for coffee planters to selfishly interfere with the interests of tea planters. If the tea pla wished to get up an agitation to better their own interests, it wa duty of the Association to support them without considering result it would have on their respective products.

Mr. J. W. HOCKIN said he was interested in coffee, but wou this case be glad to back the interests of the tea planters. resolution was then put and carried.

REGISTRATION.

The meeting then proceeded in Committee to consider the M randum and Articles of Association. The former were passed, the latter were being considered when an adjournment was ma

To-morrow Mr. Cameron will be present as a visitor, when cultural matters will be discussed.

The Association meets again at 10-45 A.M.

THIRD DAY.

BANGALORE, 10*th Aug.*—The delegates to the Fifth Annual Me of the United Planters' Association met to-day at the Cubbon R at 10-45 A.M.

A CORRECTION.

The Chairman said that before they commenced busines would like to make a remark about the report that he had seen *Madras Mail* on the subject of the debate on Currency. The v thanks unanimously accorded to Mr. Acworth for devoting a portion of his time during his holiday to the Association's inte had been left out. He had no doubt that all would wish that Resolution should be recorded.

LEAF-DISEASE.

On this subject, before the meeting resolved itself into Comm for an informal discussion with Mr. J. Cameron, the Mysore Go ment Botanist, Mr. J. A. Harris, S. Mysore, made the follo explanatory statement:—"I am pleased to be able to report th Mysore during the past year we suffered comparatively little *Hemeleia vastatrix*. Its presence was noticeable throughou monsoon and up till the end of November; but it never assu virulent form and gradually passed away. We had a very season, no rain falling from the end of October till the beginni April, save in some slight showers late in December, and to th doubt was due the subsidence of the pest. But though droughts to which Mysore is subject and the comparative isol of the estates are a great safeguard against the spread of the sp and practically assure us from the disastrous results which place in Ceylon, we are still left to face the fact that in se favourable to its development we shall probably continue to serious losses. We must not, therefore, allow the compar immunity of some years to make us oblivious to danger. Th cussion at our last meeting, though the object some of us stro was not achieved, has not been altogether fruitless, as we shall later on when the Agricultural Chemist question is discussed Graham Anderson, in an exhaustive paper which he has laid o table, has referred in his preliminary remarks to the criticis which my views were subjected. Well, criticism is most whole but I regret to have observed in some quarters an inclinati decry the consideration of such subjects as *Hemeleia vastatrix* a meetings, on the ground that it is unwise to announce their ence, as by so doing our industry is prejudiced, and its fin position compromised. I venture to make a protest agains view. In the first place, there are other sources of inform besides the Reports of the U.P.A. Meetings, and if there wer short crops would reveal the situation. In the second place, I tain that our industry, so far from being discredited by suc cussion, will gain in estimation, as it will be seen that we are al dangers common to all agricultural enterprises, and are strivi mitigate them. In the third place, I say that if scientific inve tion, as we called it last year, were to be excluded from our A paper, the U.P.A. would be deprived of one of its most impo functions, namely the holding of deliberations regarding m which vitally affect our industry. And, lastly, I assert, we h perfect safeguard against our industry being depreciated in discussions, in the fact that self-interest ever prevents a man running down that on which his own prosperity depends."

The meeting at this stage went into Committee to discu subject of leaf-disease and methods of improving the present s of coffee with Mr. Cameron.

On resuming general meeting again, Mr. Cameron made the follow-ng remarks:—

Mr. Chairman and Gentlemen,—Before my concluding remarks o-day, I should like to thank you for having given me this opportu-ity of meeting you and hearing your views, which were most nteresting. When I was here last year we spoke chiefly on the ertilisation of coffee plants. I do not know that any of us have done ery much since then but speak on the subject. I don't know at least f any one has acted. In your organ, *Planting Opinion*, I published short article on the fertilisation of the coffee flower, from which you ill be able to see how crossing is done. Probably some of you have ot seen the article. It was written over the initials "J.C.," as I did ot sign my name in full. Well, if you read that over again, you will ee how the process of fertilisation is effected. It is a very simple ne; there is nothing very difficult about it. The only thing is that we ave to wait for some time before we can see any results. I hope all f you, at least some of you, will go in for this and try and assist me nd others to carry out some improvement in the production of new trains of coffee. I am quite positive that in this way you will here-fter achieve wonderful results. In improving the strains of plants e are following very much the same principles as we do when we try nd improve breeds of cattle or races of men. The principles are ntirely the same, only that plants are far more easily improved than attle or men. But you must be persevering and have patience and o on with your experiments quietly and on a limited scale on your states till such time as you find you have gained something definite, omething worth achieving. Then in addition to the work of hybridi-ation you must do a good deal by selecting the seed. That is a time-onoured practice at Home, not only by seedsmen and nurserymen, ut also by farmers and agriculturists of all sorts. In selecting seed ou will find the farmer is very particular only to have the heaviest nd finest and best. And it should be the same with the planter in his country. He should not be satisfied with mixed seed; he should nake sure that he has the heaviest, largest and finest in every respect. He should exchange his seed by sending it to other parts of the country o friends and ask them to send him back their specimens of seed qually carefully selected. He should also try and introduce seed rom other countries, such as West Africa, Brazil, Jamaica and other laces where coffee is largely grown. I don't know that I can add nything to these remarks; but as you seem very keen on fertilisation nd seed selection, I think it right to tell you that by means of these wo a man can do a great deal. Of course, high cultivation you tho-oughly understand, and it is needless for me to say much about it. believe, however, that you are going to bring up a proposal concern-ng the appointment of an Agricultural Chemist. In this connection ill you allow me to say that there are chemists and chemists. Hear, hear.) If you are going in for the services of a chemist, I trongly advise you to get the very best man available. You will ave to pay a heavy salary for such a man, but do that ungrudgingly nd your money will be returned to you twentyfold. It is no use oing to a cheap man who will make you believe this, that, and the ther thing, till eventually you find nothing good. I strongly advise ou to get the best man possible, and if the Mysore Government or ny other Government can help you in the matter, take their help nd be thankful. I don't think I have anything more to add except hat I am much obliged to you for giving me a hearing. (Cheers.)

The Chairman:—I beg to move a hearty vote of thanks to Ir. Cameron. The discussion has been a most difficult one to report, ut it has been one full of interest to all present who have heard it—n interest entirely due to Mr. Cameron. Again I thank him for is courtesy in accepting our invitation.

Mr. Graham Anderson:—I have the honour cordially to second he Resolution moved by the Chairman. We are all deeply indebted o Mr. Cameron for the kindly, courteous, and painstaking manner n which he has explained matters to us.

Mr. Cameron then left, and the discussion in open meeting was esumed.

Mr. Graham Anderson had prepared the following paper:—"Last ear, during the discussion which took place at the Annual Meeting, he Honorary Secretary of our Association made some excellent emarks relative to the immense advantages which an Agricultural hemist could confer on the planting industry by the scientific nvestigation of the mysteries which surround the development of he various pests which affect coffee. As he was one of the principal peakers on that occasion, the idea became prevalent in London that Iysore suffered more seriously from injurious pests than any other istrict, and he subsequently at the Annual Meeting of our Association most perfectly explained that this was not the case, and that all he had said was necessary to add weight and importance to the fact that in all planting districts there are an immense number of most difficult problems awaiting solution which can only be properly dealt with by scientific experts. I most cordially agree with Mr. Harris on this important point, and having read portions of the elaborate report by Dr. G. Watts, of the Calcutta Museum, on the various pests which attack tea, I greatly rejoice to hear that the Government of Mysore, with its usual promptitude and benevolence, has had the matter under its consideration, and that there is a prospect of steps being taken to provide the necessary assistance to agriculture generally in the province. I most cordially sympathise with Mr. Harris in regard to the difficulties which he has experienced, as I have already had more than my fair share of them. It is impossible for any one to draw attention to a pest, an experiment or a difficulty without being misjudged or misunderstood in one way or another. The fate of one who ventures to trespass over the boundary line which separates practical working from scientific investigation is always most discouraging. Many years ago I contributed in a very humble way to the fugitive literatue of *Hemeleia vastatrix*, and as the subject is to be considered at this meeting, I very naturally desire to take part in the discussion. As, however, I have very little to add to what I have already written, and as what I have written is far more than I could attempt to explain without unduly taxing the patience of the meeting, I have made a collection of extracts from the *Tropical Agriculturist* and other papers which, I trust, may prove convenient to those who can spare time to peruse them. So far as my own views are concerned, I must continue to claim every possible indulgence. They have been printed and published years ago, as I have known *Hemeleia* as an enemy ever since 1862, when I first joined the planting community, and although I received the thanks of the Government of Madras for my humble conclusions and suggestious, still the opinions expressed thereon by competent scientific authorities had the effect of putting a full stop to any desire to write further on the subject. While cordially agreeing that "to attribute a specific effect to a vague and widely diffused cause is not likely to conduce to the advancement of knowledge," I venture to agree with the same authority that "speculation may rest on a sufficient basis and may be of a sufficiently grave character to call for the most anxious enquiry on the part of those by whom the truth may be ultimately ascertained." Agricultural and horticultural experiments require years of patient toil before safe or useful deductions can be made from them, and as an example of the discouragement offered to those who undertake them, I must refer to the issue of *Planting Opinion*, dated 16th July, 1898:—"We reprint elsewhere an interesting article that recently appeared in the *Madras Mail* on certain wonderful results alleged to have been obtained from hybrid coffee trees in the Wynaad. The article itself is a very readable one, but we confess we are a little sceptical as to the anticipated results. Who that remembers the great fuss made some years ago at Mr. Brooke Mockett's wonderful Mysore hybrids, and the manner in which their expectations were negatived by results, will have the courage to expect anything very different from the Wynaad hybrid." Now, I hope that the writer of these most unkind remarks will be surprised to hear that Mr. Brooke Mockett's carefully conducted experiments have given results which are of great interest and importance to the planting community. At present there are numbers of very promising three and four year old plants which are in every way like the parent, and in addition to these there are other distinct strains which will contribute very considerably to sustain interest in the second phases of the experiment, in connection with which arrangements are already in progress on an extended scale.

"I have a very delicate matter to deal with personally. Over twenty years ago I wrote a small pamphlet and subsequently embodied my views regarding the disease-resisting power of plants raised from carefully selected seed of hardy varieties, together with conclusions relative to the beneficial effects of improved cultivation and the use of certain manurial preparations. After sixteen years, I have now to acknowledge that *Hemeleia* continues to cause losses which vary in accordance with the season at which it appears and the arrangements made to modify the effect of its attack. I have visions of being asked to remember the "great fuss" formerly made about my own very humble experiments. My position is a most unenviable one, as I cannot possibly prove that my expectations have not been absolutely "negatived" without laying myself open to be styled egotistical or presumptuous. Under the circumstances, I prefer to

accept all risks and confidently look for every possible consideration. I have absolutely no cause for regret in regard to what I wrote or suggested many years ago, and hope to be able to afford evidence that the introduction of a new strain of coffee into the province has produced results which are now widely known and appreciated. Although some of the manurial preparations have not been accorded a more extended trial owing to their great cost of the liability of their effects being seriously influenced by the variations of climatic conditions, still, thanks to the ability of my brother planters, ways and means have been adopted which, although not calculated to provide an absolute remedy for the pest, have most appreciably modified and restrained its injurious effects. Among these may be classed : Improved methods for maintaining the soil in good physical condition, by efficient working, draining and mulching. Various improvements in the raising of plants from selected seed of hardy varieties in baskets and in nurseries formed on virgin jungle soil and well drained situations. The use at certain seasons of suitable and well-balanced manures containing those constituents which frequent crops of coffee are known to remove from the land. The careful selection and arrangement of suitable shade trees and the removal of those which exert a pernicious influence on the coffee or on the mechanical condition of the soil. The maintenance of efficient systems of pruning and handling suitable to the requirements of soil, elevation, aspect and locality, and regulated so that, at the time when the pest usually appears, the shoots may be of that description which local experience may have indicated as best calculated to stand its attack. The careful adaptation of all operations of routine culture to the requirements and changes of season, particularly in regard to the amount and distribution of rainfall.

"In 1880, as a delegate to the Representative Assembly at Mysore, I had the honour to make the following remarks :—" As the industry is one of the oldest and most important in the province, I may be permitted to give a brief account of the principal improvements which have been effected within the last two decades. After years of careful study, it was found that not only was the description of coffee plant which was originally cultivated unfitted to the climatic conditions of certain localities, but that many of the forest trees which have been left in the clearings as shade or shelter had a detrimental, or even in some cases a pernicious, effect on the coffee around them. A perfectly new system had, therefore, to be adopted. About seventeen years ago four South Mysore planters introduced experimentally the carefully selected seed of the Nak Nad variety of coffee from Coorg, and to this chance experiment must be attributed the yearly increasing prosperity which now attends the industry. Observation having clearly proved to both the European and Native proprietors that this strain of plant was eminently well-suited to the soil and climate of our Mulnad, a very large nnmber of new estates were rapidly opened up, and in addition to this, many of the old plantations were systematically re-planted and are now actually in better condition and more remunerative than they have ever been before. The great problem of shade has also been satisfactorily dealt with. Objectionable trees have been removed in great numbers, and millions of young plants of carefully selected and approved varieties have been propagated and established instead of them. It will, therefore, be seen that the Mysore planters in many cases have not only had to remove their original coffee, but have also had to grow a new forest covering for the Nak Nad variety of plant which has been introduced and which now holds on to the prospect of increasing prosperity for years to come.'"

Mr. R. H. Elliott in "Gold, Sport and Coffee Planting in Mysore," at page 311, makes the following statement :—" I have alluded to the tradition of coffee being first introduced into Mysore by a Mussulman pilgrim about two hundred years ago, and the species of coffee that was introduced then or at some subsequent period was the only one known in Mysore when I entered the province in 1855. This plant was finally called the 'Chick' variety of coffee, and the name was taken, I believe, from the town of Chickmaglur, which lies close to the original Mysore home of the coffee plant. The variety had thriven well and promised to do so for an indefinite period of time, but towards the end of 1866, and during the three succeeding years, we had dry, hot seasons which caused a general attack of the borer insect, and at the same time there occurred a general decline in the constitution of the trees which, though no doubt greatly hastened in the majority of instances by the borer, has never been explained, and so serious was this decline that, had we been dependent wholly on the original Mysore variety, it is the opinion of one of our most experienced planters that, to use his own words, there would have been an end to coffee planting in My except in the case of a few elevated tracts on the Bababudan of hills. But, most fortunately for the planters, the Governmen the people of Mysore, Mr. Stanley Jupp, a South Mysore pla took a trip in 1870 into Coorg, which lies on the south-west fro of Mysore, and was so favourably impressed with the vari coffee grown there that he recommended that experiments shou made with it in Mysore, and in 1871 experiments on a conside scale were made with carefully selected seed which was obt from Coorg by Messrs. R. A. and Graham Anderson, Mr. B Mockett and Mr. Arthur Jupp. The experiments turned remarkable success, the young plants raised from the imported grew with extraordinary vigour, and it was soon found that th variety would grow and crop well, and even on land on whi attempts to reproduce the 'Chick' variety had utterly failed. the sinking industry rose almost as suddenly as it had fallen and abandoned estates, and every available acre of forest, and scrub, were planted up, and land which used to change han from five to ten rupees an acre was eagerly bought in at twelve these amounts." In the year 1875 I had the honour, as Hon Secretary of the Mysore Planters' Association, to submit fo information of Government a report setting forth the conditio prospects of our enterprise, from which I quote as follows :— realisation of Halut, or excise tax at one rupee per cwt. on produced from 52,888 acres of land granted in the North Asta Division was as follows :—

	RS.	A.	P.
1869-70	23,007	1	8
1870-71	23.741	0	6
1871-72	20,564	13	2
1872-73	21,903	15	5
1873-74	13,454	7	10 "

"These figures show that only 5,133 tons of coffee were proc in Southern Mysore in the five years under notice, or on an av of 1,026 tons per annum. Valuing this at Rs.700 per ton, wh more than the average price for plantation and native coffee, w that the produce from what may be roughly classed as half lands granted for coffee in the province (as comparatively few es then existed in the other division) represented an annual n value of Rs.7,18,200, which, allowing a similar amount fo Nugger Division, would only give an aggregate of Rs.14,36,40 the whole of Mysore. Owing, however, to the immense extensi cultivation and the success which attended the introduction Nak Nad variety of plant, the total yield of coffee in the year represented a gross value of 70 lakhs of rupees. The great stin afforded by the gracious act of His Highness the Maharaja promptly sanctioning the introduction of an acreage assessm coupled with permanence of tenure, is therefore most clearly fested, and the money realised during the period of increased perity having been carefully expended on the work of fu developing the industry, the official reports issued in 1893 p that Mysore was on a level with Coorg, and the two provinces classed together as producing more than two-thirds of the amount of coffee exported from Southern India. I can never s ently thank Mr. J. P. Hunt, of the Glenmore Estate, for the ca so kindly bestowed in providing Nak Nad seed for the first ex ments, or Mr. Mangles, of the Hallery Estate, for his courte supplying me with seed from his Coosgoor and Santicoopa prop in subsequent years. I have the honour to express the hope t have demonstrated the fact that the coffee industry in Mysore unworthy of the fostering care and solicitude which the Durba always been pleased to evince, and that both in regard to the which continue to injuriously affect the coffee, arecanut, carda pepper and cocoanut plantations, and the many other problems still await solution connected with the agricultural industries province generally, it is essentially necessary, if prosperity is maintained, that the services of a competent Agricultural Ch should be rendered available for guidance and advice in all matt difficulty. I am quite prepared to be told that the amount of exported from Mysore has fallen off during the last few years. is perfectly true, but the cause is easily ascertained by a glance rainfall register. We have in fact during the last three experienced similar conditions as those which have prevailed in land, and which "Dagonet" has rightly called "meteorol atrocities." The distribution of rainfull has a far greater effe agricultural prospects than the quantity, and conditions anal to those which have caused a famine in Bengal have not been wa

their effects on equally sensitive industries in other parts of dia. I am delighted, however, to state that on all properly culti-ted estates, the coffee this year is looking magnificent, many of e oldest fields being among the best.

I prepared the first two pages of this paper as my address on this bject on this occasion, but as I have given nearly every member a py, I venture to ask you to consider it as read and thus save your me. But there is one point I desire to press upon this meeting enerally, and that is when Mr. Marshall Ward, the great cryptoga-ist, visited Ceylon some years ago, he drew up a report, the con-uding words of which were to the effect that the life history of this rasite had now been traced through all its phases and nothing now emains to be done except to carry out all further investigations in e most elaborately furnished laboratories that Europe could afford. venture to think, gentlemen, that this is the point at which investi-ations ought now to be commenced, and I feel certain from the tention which I have paid to the appearance of these plants during rying seasons of the year that it will be found at any rate in the y climate of Mysore that we only get leaf-disease at certain sea-ns, and these seasons are very short in duration. I think that ith the help of some scientific authority a way might easily be und for remedying the evil. I have the most entire confidence in hat I am saying because, during a long residence in that district, have noticed that leaf-disease appears under certain conditions and oes not appear under certain other conditions, and when once it has ommenced we can almost accurately decide how long it is going to st or our prospects of getting rid of it quickly. One point I should ke to dwell upon with the greatest emphasis, to clear away for ever l idea that we, in Southern India, plant under conditions that offee was cultivated in Ceylon. There they had a warm climate ith almost incessant humidity, so that once the parasite took effect lasted for .months. That is impossible in a climate like that of outh India, except perhaps in some particular situations. As far s we are concerned we get an attack once or twice in a season and ien only very temporarily. I feel sure that if the Government of Iysore carry out their benevolent intention of giving us a scientific an on whose guidance we can rely we will find that all growers of offee, sugarcane, arecanuts, cocoanuts and cardamoms, and in fact ce and all other cereals will have gratefully to acknowledge the enefits accorded in the scientific advice which would enable them o get rid of this pest. (Applause.)

Mr. PARSONS (Coorg):—With reference to the proposal passed last ear on page 86 of the proceedings, I beg to propose that it be put nto force, and that Mr. Cameron's services be lent to us with a view o investigating and reporting on the different kinds of coffee he will ee in Coorg. The result of his investigations will be carefully eported to the U.P.A., as it may be useful in deciding what steps ay be taken another year by some other Associations. We ask you ow to endorse that Resolution and that the Secretary be instructed, s soon as possible, to take such steps as may be found necessary to ecure to us Mr. Cameron's services, and that the Rs.1,000 voted ast year towards the expenses may be made available if required.

Mr. J. W. HOCKIN seconded the motion.

Mr. HARRIS asked what was the result of the representation on this ubject to the Government of Mysore last year.

THE CHAIRMAN:—The whole matter was contingent on Government nd the Associations subscribing. We took the whole five agri-ultural subjects together, and as the Associations did not feel nclined to subscribe, nothing further was done in the matter.

After some further remarks, the matter was considered in Com-nittee, when the following Resolution, proposed by Mr. Parsons nd seconded by Mr. Hockin, was carried and was afterwards con-irmed in general meeting:—"That the Resolutions passed last year or obtaining Mr. Cameron's services be put into force and that, if ermitted, he be deputed to visit Coorg, the results of its investiga-ions to be reported to the U.P.A., provided his expenses do not xceed Rs.500."

AGRICULTURAL CHEMIST.

Mr. J. A. HARRIS (S. Mysore) opened the discussion on this subject n the following speech:—

I greatly regret that it was found impossible to carry out the cheme proposed last year, but the discussion that then took place s bearing fruit. The apathy shown by some districts was little hort of astounding, and the lack of interest manifested by the overnment of Madras and some of the Native States was, to say the east of it disappointing. The Government of Fort St. George has xhibited such sympathy towards planters that it did not seem out of the way to expect that in this matter the same would be extended to them, and in view of the important position science holds in relationship to agriculture, it is strange that such should have not been the case. All the world over during the last 50 years agriculture has benefited enormously by Science; in India, perhaps, less than elsewhere, due to fewer opportunities having been offered. Throughout Europe the stress of competition has forced farmers to abandon their old practices and to conduct their agricultural operations on strict scientific principles. India, like the rest of the world, is feeling the strain of competition, and the planting industry, as represented by its various products, proba-bly more keenly than any other, so much so that a cry has gone forth for scientific help, by which it is hoped that both quantity and quality of crops may be improved. But India has another problem to face which is closely connected with agricultural prosperity, and that is the increasing congestion of population, and one of the methods suggested by which the pressure may be staved off is by improving the methods of agriculture, and so increasing the food-supply. This is a question of immense moment, but it is one with which the matter now under consideration, viz., the casting of the light of science on agriculture is nearly allied, for though the planting industry does not exactly increase the food supply, it feeds a portion of the population, and it is, therefore, the more astonishing that Govern-ment should not have viewed our scheme with more favour. It is very gratifying to us, Mysore planters, to know that the Durbar has come forward with an offer of help. We were, however, in hopes that they would engage a whole-time man, and the letter from the 1st Assistant to the Resident was the first intimation we had that such was not the case. That letter suggests that a well-qualified man should be engaged for a period of five years for the whole of South India, including Mysore; but though the sphere in which he should work is thus territorially defined, it is not clear whether it is meant that he should devote himself to the planting industry alone or to all agricultural operations. There are three different proposals which might be made. (1) That he should be engaged for the benefit of all agricultural undertakings in South India and Mysore. (2) For the planting interests only of South India and for all agricultural industries in Mysore. (3) For the planting interests alone of South India and Mysore. With regard to the first there is no doubt that the magnitude of the work would render it impossible for one man to do justice to it.

If the 2nd were proposed, the U.P.A.S.I. might justly urge that it would scarcely be within its province to subscribe towards employ-ing an expert who would devote any of his time to other than plant-ing interests. His services might be apportioned between the Mysore State and the Planters of South India, but I doubt if such an arrangement would be satisfactory, and if both interests could be adequately served with the allotted time. The 3rd seems the most feasible. It *might* be possible for one man, in some measure, to fulfil the requirements of the planters of South India and Mysore; in fact this is what was proposed last year, and it will be remem-bered that we failed to get within measurable distance of the sum required—the contribution which the Mysore Durbar have graci-ously intimated they will make, should they acquiesce, can scarcely be expected to be enough to make up the deficiency, and as far as I am aware the bad times we have passed through, and the fact that some other districts have made their own arrangements, render it extremely unlikely that more will be forthcoming than was offered last year. I have, therefore, reluctantly come to the conclusion that a combination between the Mysore Durbar and the U.P.A.S.I. is not practicable, but I am open to conviction and am prepared on behalf of my Association to accept any scheme that may be evolved at this meeting which should promise to work satisfactorily to all concerned. I am, however, convinced that the various agricultural undertakings in the Province of Mysore, on which its prosperity mainly depends, would provide ample work for a whole-time man for a period of years. The pests to which our own particular industry is subject, among which I may mention *Hemeleia vastatrix*, that mysterious fungus we call leaf rot, borer, and some scales and those which have attacked sugarcane, cardamoms, pepper, areca and some of the grain crops, call for investigation and would provide pro-longed occupation for the expert. The improvement in the methods of agriculture opens up a still wider field. It is needless to go over the ground that was occupied last year in pointing out the necessity of ascertaining the demands of the plants, the ingredients of the soil, and the constituents of the manures at our disposal. This was duly emphasised then. But I would like to mention one or two

points by way of illustrating the advantage of having an expert resident among us as opposed to consulting, and having soils analysed by, even say at Home. In the first place, it seems to me that analyses of samples of soils sent Home cannot be as satisfactory as those done on the spot. Then take draining. We are all aware on the one hand that if water is stagnant in the land the soil becomes infertile, and on the other that if drainage be carried to excess the result is an unnecessary loss of nitric acid. In a climate such as most of us live in, heavy rainfall is a feature rendering the circumstance different as compared with dried areas, and a trained man by visiting our estates should be able to give us valuable advice as regards the depth and the distance between our drains. Again nitrates are the dearest of all manure, and especially so to us who import them for the most part from Europe. In spite of this, little recourse seems to have been had to the system of green manuring, whereas nitrogen may be obtained free. A chemist could surely assist here by telling us what system to adopt, and what nitrogen-absorbing plants to cultivate. This might be of immense benefit to the ryot. Another point; the greater part of our chemical manures are imported from Europe. Is it not possible, if we had an agricultural chemist resident in our midst, that he might discover deposits of salts and other substances which would be valuable for manures, which would probably be obtained at half the price we now pay? Thomas' phosphate, which is a bye-product in the manufacture of steel, has been a source of profit to the discoverer, as well as an immense benefit to agriculture. Is it not possible that some of the bye-products in this country might be found to be valuable as manures, or at any rate others now sold as such proved to be useless?

These are one or two points that have occurred to me to prove the desirability of having a resident expert, and the immense scope there is for his employment. I feel assured that there would be ample work for one in Mysore, that the Durbar would be fully recouped for the outlay in due course, and I trust they will see their way to making the appointment for a few years. Let us hope that the eventual outcome may be what the *Madras Mail* foreshadowed in a recent article, viz., an Agricultural Chemist at various stations in the Presidency and one in all the Native States, and should Mysore lead the van, we, her planting community, will be proud of her sagacious foresight. Agriculture in India must, in future, work hand in hand with Science, if she is to compete successfully with other countries. The appointment of one or more Agricultural Chemists would be a move of the highest importance, and might, eventually, by causing improvement in agricultural methods, prove a powerful factor in coping with the demands of an ever-increasing population.

The meeting immediately resolved into Committee, when the following Resolution was arrived at. It was proposed by Mr. J. A. Harris and seconded by Mr. Oliver (N. Mysore):—"That this Association in thanking the Mysore Durbar for their gracious offer would be willing to co-operate with them, but is of opinion that there is ample scope for the employment of an Agricultural Chemist in each of the following areas: the Madras Presidency, Mysore and Coorg, and it proposes to urge this on the respective Governments concerned."

The Resolution was after the luncheon interval confirmed in General Meeting.

Mr. Sprott (Coorg) moved that "in the event of the replies to our repesentations with regard to the appointment of one or more Agricultural Chemists being satisfactory, the Committee be empowered to allot the sum of Rs.2,000 out of the Reserve Fund towards the expenses."

It was seconded by Mr. J. W. Hockin and carried unanimously.

LADY-BIRDS.

Mr. H. O. NEWPORT, in Committee, answered several questions put him with regard to the attempt to import lady-birds from Australia to prey upon the scale pests infesting coffee on the Lower Pulneys and elsewhere. His suggestions for further action are contained in the following Resolutions:—

"That this Association do collect all possible information on the subject of the importation of lady-birds from Professor Blandford and others, and in the meantime await the result of Mr. Green's experiments (in Ceylon) before taking steps in the importation of further consignments, and that as soon as possible a supply of *coccinellidæ* be imported by the most approved method and experimented with in South India." The motion was seconded by Mr. Hockin and carried both in Committee and General Meeting.

In connection with this subject the Chairman proposed a cordial vote of thanks "to the Premier and to the Agricultural Depar of Queensland and especially to Mr. Henry Tryon, the Goverr Entomologist, for the courtesy he showed to our represen Mr. Newport and the assistance they gave in his work in that cou

Mr. EDMISTON proposed a Resolution pleading for further in gations locally. It was seconded by Mr. Knight, but as it tran the carrying into effect of this Resolution would involve expen which could not be made available from the funds in hand, decided to withdraw the proposition.

The subject of cinchona was dropped, as was also the adulter of manures, after a short discussion. Finances was disposed Committee, and then the important subjects of roads and com cation and railway were discussed at some length. Want of forces me to hold over a full report of this until my next. mention that a telegram received from the Editor of the *Madra* announcing that he had ascertained that the Government of viewed favourably the case made out for the planters in the mittee of Enquiry in 1896 and that orders would shortly issu received with acclamation.

ROADS AND COMMUNICATIONS.

THE CHAIRMAN said:—In opening this discussion on Road Communications, I am going to move that this year more de action should be taken in representing the matter to Govern At every meeting of our Association since first it was estab protests have come from the different Associations about th state of their roads, and although, as was the case last ye passed a general Resolution on the subject, I do not think hitherto we have been sufficiently earnest and energetic i matter. I do not know how you are affected individually, but I we may find this out at this meeting, and that it will result in energetic steps being taken to remedy what I believe to be a st affairs disgraceful to the Government of India. Last year we p a Resolution to the effect that the U.P.A.S.I. should back up an complaints from District Associations to their several Governi as to the state of roads. The only Association that took adva of this promised assistance in the course of the year was my Wynaad, and the representation from the Wynaad planters wit additional letter from the U.P.A.S.I. has met with no res whatever. Mr. Hodgson in his speech on the Budget in the M Council pointed out that the great saving in the expenditure Government of India was at the expense of the producers, and in consequence an adequate return should be made to the increased works for their benefit to cheapen the cost of produ by means of an easier access of labour and of the carriage of pro Naturally this led to no result, as the debate was the budget Madras Government and not on that of the Government of I who by their provincial contract rule the expenditure. But I it may have done good service in directing attention to the m and I do think we ought to back it up as strenuously as pos Lord George Hamilton in his speech on the finances of Ind the House of Commons on the 7th June admits that the ba sheet is satisfactory because of the steady rise in the exchange of the Rupee during the last three years. But he does not go explain that this is achieved at the expense of the producer; in he deprecates argument on the subject lest he should be subj to use his own words, as would have been the case in the M Ages, to the stake and the rack. None of us doubtless wish t that done, but we should like to see him invest some of the earned increment of his office in the production of tea, or other industries in India. Then perhaps the individual being affected, we might have broader views expressed. The bi that £2,615,000 are borrowed for the extension of railways, unfortunately a large part of this is for strategic line hopeless and useless wars. If only a very small portion cou subtracted for the maintenance of communications between important producing centres with the ports of exit, it w make but little difference to the total outlay. I believe tha we in Wynaad want is a grant of a few thousands for our lines of traffic, but without it our industry is checked, our c have to pay famine rates for provisions, and we run the risk total cut off of supplies from our chief grain supply from My I am now citing an individual case, particulars of w Mr. Hockin will give you; but if only representatives from Associations will back us up with clear statements of their indiv cases, I think we might do more good than by the desultory c spondence with the Government that we have hitherto carried

Mr. J. W. Hockin (Wynaad) said that as far as Wynaad was con-rned their complaint was that they had a climate that was the me as that of the Nilgiris; but in their case Government was vays willing to back the Nilgiri District Board with liberal grants · communications; but they reversed the policy entirely with alabar. One of their main roads ran half way through the lgiri-Wynaad and the other half through the Malabar-Wynaad. e Nilgiri District Board got a grant of Rs.500 per mile for main-nance of this road, but the moment it crossed the boundary the ant was cut down to only Rs.250. The President of the Malabar strict Board noticed this fact, and wrongly, I think, applied for a nsfer of some of the Niligiri funds to Wynaad. No doubt the lgiri District Board had not got more money than it wanted; but at ought to have been done was to point out to Government that e climates of these adjoining districts was so exactly the me, the Government having recognised the necessity for a grant the Nilgiris ought to have recognised the necessity for a similar ant to the Malabar-Wynaad. If the Madras Government ever ve a small extra grant to the Malabar-Wynaad, it was a very small e, and Government was careful to explain fully to them that they d no right to it, as it was only given as a special case. The overnment of India was in the position of a landlord was much as e State owned a great portion of the waste land of the country, d it ought to be a part of their settled policy to devote a certain nount to improving this property by maintaining communications nd encouraging the extension of cultivation as much as possible. said one of the greatest problems it had to face in the future was provide food for a rapidly increasing population. They recognise e necessity for this in theory; but in practice to reject it for want funds. This was, however, a case in which funds ought to be ade. Take the case of a man with a large estate in an undeveloped ndition. He does not say I am not going to do my duty by it ecause he has no funds; he says, on the other hand, the property is valuable one, and the population on it is increasing, and he gets the oney how he can to spend upon its development. I think we ought to mpress upon the Government of India that though they have got o funds, it is a part of their duty to make the funds to invest in is remunerative speculation the development of waste lands provide for the needs of the rapidly growing population. I am ld, on good authority, that the Punjab Government have been very ccessful in the colonisation of waste lands put under irrigation, but at it was found useless to form these colonies of paupers. It was nly when good cultivators with some means were induced to igrate that the colonies flourished. We planters do employ the auper class very largely. We provide the capital and discipline the auper class, and we should therefore receive all possible encourage-ent from Government as we raise the status of a class which annot form colonies on its own account. What they are doing now in Malabar is throwing more and more of the roads on the District Board, nd doing all they can to get out of giving money for extra grants. he Wynaad was not a new district, but it was developing in a way at urgently demanded better roads. For the transport of coffee might be said that the old fair weather roads served the purpose dmirably, but when it came to tea you must always have good roads, hich you can use all the year round. Under the present policy of arving the Malabar-Wynaad, and refusing to give it proper metal-d roads, the tea industry would never prosper. The Government ight not have the money to embark in a scheme of making new oads through the district, but the least it could do was to see that e existing roads were kept in proper repair. One of the main roads ent into Mysore, and it was through this route that much of their rain came. The road was in such a disgraceful state that the Wynaad Association addressed in June last. They got no answer ll December, when they were asked to send another copy of their etter, as the first had been mislaid. The copy was sent, but the Association had not received an answer yet. That road was now in uch a bad state that the grain carts could not come through.

Mr. H. O. Newport (Lower Pulneys) said he would like to bring efore the meeting the subject of the state of the roads in the Lower ulneys. He had brought the subject before the meeting ever since is district had joined the Association. It was not the bad state of he roads that they complained about, but the absolute want of roads. n October last he, with the Secretary of their Association, were eceived in deputation by H.E. Sir Arthur Havelock at Madura, and ut before the Governor all the facts of the case. His Excellency eplied to the effect that he would take the earliest opportunity of ttending to the matter, and promised, if possible, to sanction the estimate in the present financial year. He was afraid, however, that they would be left out in the cold again, and would have to wait for a another financial year to see the work started. Their request was a very modest one, namely, for a bridle-path, and had been before Government since 1896. They had received promises every year; but none so definite as Sir Arthur Havelock's last year. In spite of that, however, up to the present nothing had been done, and they were still in the position of 1893, having no roads at all. The Chairman's proposition, seconded by Mr. J. W. Hockin, runs as follows: —"That considering it is the fixed policy of the Government of India to spend a certain sum of money each year on Railway extension, that the Government of India be addressed, through the Madras Government, pointing out the paramount necessity of spending certain sums each year out of Imperial funds on opening new and improving existing roads in all districts where a considerable extension of cultivation is possible."

The Resolution was carried unanimously.

Railways.

Mr. H. G. Parsons (Coorg):—Gentlemen,—While we cordially support in every way the Resolution passed with regard to Roads and Communications there was no subject which required more support from them as that of Railway extension. Coorg would long ago have had a railway if it had a road to get to it. Recently the Consulting Engineer for Railways, Madras, had sent copies of a letter addressed to the Government of India, Railway Department, and the correspondence thereon. It was a most interesting communication and they had been asked to give an opinion on it as quickly as possible. He believed the various Chambers of Commerce had also been asked and had already given their opinion thereon. He therefore begged to propose the following Resolution:—"That this Association do support the policy of the Government of Madras as set out in G.O., No. 852, Railway, dated 23rd June, 1898, forwarded by the Consulting Engineer for Railways, Madras, for an expression of opinion, and that the Secretary of the U.P.A.S.I. immediately communicate with him expressing a hope that the subject may be considered at the Railway Conference at Simla in September." If you read the circular and the correspondence that has taken place, I have no doubt that the scheme proposed by the Madras Government may be described as a great one, namely, for the conversion of the Madras Railway from Podanur to Calicut and from Calicut to Cannanore from the broad to the metre gauge. I believe that the Madras Government thinks so much of the scheme that it has stopped the extension of the line from Calicut to Cannanore pending a settlement of this question of the gauge. If this is settled, we may probably then see what we have long looked forward, namely to the continuation of the line from Tellicherry through Coorg to Mysore. If you look into the matter, you will see that the policy of the Madras Government and the Consulting Engineer has been influenced by the present Governor of Madras, who is not new to the wants of the planting enterprise, and has much experience of the necessity for Railways and good roads for the planting interest. A member of our Association said the other day at our meeting to consider this matter, and that above everything the U.P.A. should be emphatic on this subject of Railways and Roads. In fact, he went so far as to say that it should be put before everything just now. If we look at Ceylon we will see that if it was not for their good roads, they would have their tea placed at a more serious disadvantage than it was now. Coorg has always represented her needs in this respect very strongly for the past twenty years to the Government of India, and the reply was that practically that everything came to him who waits. Over twenty years is a good long time to wait, and I must honestly admit from what I see now that I don't think at any time previously has the prospect of a railway been more encouraging than it was now. They had always to meet one difficulty when they had a Conference on Railway affairs. Their position was summarised in a few words, why don't you get private enterprise to give you a Railway. The answer to that was the Railway policy was ruled by the Government of India, and private enterprise was out of the question when so large a part of the country was controlled already by private Companies. We have also so far as Coorg is concerned been twitted with the charge that we have not been consistent in our advocacy of the route to be taken. In reply to this, I may mention we have always supported the extension of a line from Tellicherry through Coorg to Mysore as being the best. But when we have had other proposals before us which seemed feasible, we have supported them. Now that the Madras Railway have taken the matter up under these circumstances,

he asked for unanimous support for the letter from the Consulting Engineer, Madras. Mr. Windle seconded the proposal with similar remarks to those he made at the meeting of the Nilgiri Association recently.

Mr. Graham Anderson opposed the motion as being one in support of a scheme which was in opposition to the proposed Arsikere-Mangalore Railway in which the Mysore Durbar was most interested.

Mr. Parsons having been heard in reply to the effect that the Madras Government's scheme would in no way affect the Arsikere-Mangalore line, the Resolution was put to the vote and carried by a majority, the Mysore delegates refraining from voting for the following reasons:—"As members of the planting community of Mysore we well know the deep interest which the Durbar evinces in regard to the extension of Railway facilities generally, but knowing as we do that the Government of Mysore has in no way relinquished the investigation of the alignment for a Railway to join Arsikere with the port of Mangalore, we cannot possibly vote on the subject under discussion without first consulting the Dewan of Mysore."

REGISTRATION.

The Meeting in Committee then proceeded to further discuss the Articles of Association, terminating the sitting for the day at 6 P.M.

LAST DAY.

BANGALORE, 11*th Aug.*—The delegates to the Fifth Annual Meeting of the United Planters' Association met this morning for the last time to finish the agenda and to formally bring another very successful meeting to a close.

REGISTRATION.

The following Resolutions on this subject, the outcome of the deliberations in Committee, were put in open meeting and unanimously passed:—"That the Secretary be desired (1) to prepare the Memorandum and Articles of Association of the proposed Incorporated Associations according to the drafts revised at the meeting, (2) to apply to Government for a license to register the Association under Section 26 of the Indian Companies Act (VI. of 1882), and (3) to duly register the Company not earlier than May, 1899."

II. "That on such registration being effected, the Chairman, Vice-Chairman, Committee and Secretary of the U.P.A.S.I. for the time being shall become the Vice-Chairman, Council and Secretary, respectively, of the Incorporated Association, and that the continuance of the work done or in progress on the part of the present Association shall be entrusted to the Incorporated Associations."

III. "That the registered offices of the Incorporated Association shall be the offices of the Secretary for the time being."

IV. "That a design for a common seal be prepared and submitted to the Committee for approval, and after approval be adopted as the common seal of the Incorporated Association."

V. "That all books, papers and moneys of the present Association be made over to the Incorporated Association as soon as registration is effected, and that the Committee and Secretary be desired to do everything in their power to carry out the aim of the present Resolution, which is that the work of the present Association should be made over to the Incorporated Association and by it carried on without breach of continuity."

The Resolutions were put *seriatim* and carried unanimously.

IMPORT DUTY ON CHEMICAL MANURES.

The Chairman said that yesterday he was not able to lay before the meeting the necessary information as to what was about to be done on the subject of exempting certain chemical manures from import duty, as he had not the papers with him. He then told them that he had been in correspondence with the Revenue Secretary, Government of Madras, and had learnt that it was the intention of the Government to include certain chemical manures in the list of imports exempt from duty. These were muriate of potash, sulphate of ammonia and kainit salts. The Government had, however, declined to include nitrate of potash because it was a product of the country and was largely used for purposes other than that of manures. He then submitted the matter to his agents at Calicut, and they had suggested the addition to the list of exempted chemical manures of phosphate of ammonia and sulphate of potash. Sulphate of potash, they said, should be included, because, though very little was at present imported, it was quickly growing in favour and contained 90 per cent., whereas kainit only contained 53 per cent.

The Meeting then resolved into Committee to consider the su

On resuming General Meeting again, Mr. Fred. J. Parton pro and Mr. J. A. Harris seconded, "that the U.P.A. reque Government of India to exempt from duty all artificial manure the exception of nitrate of potash and any others which are l used for purposes other than manurial." The last portion Resolution was suggested as an amendment by Mr. Robert Gor (Shevaroys), and was accepted by Messrs. Parton and Har included in the Resolution, which was passed unanimously.

Mr. G. R. Oliver (N. Mysore) proposed, and Mr. J. A. seconded, "that the Traffic Managers of all Railways in So India should be addressed with reference to the carrying of ar manures at manure rates instead of at chemical rates whic sometimes charge on certain manures." The Resolution was c

CROP ESTIMATES.

The Chairman said that the Secretary had received as long October last a letter from the Indian Tea Association addres the Travancore Planters' Association and which had been s the last Association to the U.P.A.S.I. The letter contain enclosure from Messrs. Gow, Wilson and Staunton, which p out that the Committee of the Indian Tea Association in m crop estimates and despatching monthly telegrams did not i the figures from Travancore and the Nilgiris. The Commit the Indian Tea Association accordingly requested that arrange might be made to send the figures for these districts dir Messrs. Gow, Wilson and Staunton, and at the same time Committee of the Indian Tea Association for informatio guidance.

The Tea Association connected with the U.P.A.S.I. agr supply the figures of crop estimates as requested.

THE MADRAS FOREST ACT.

Mr. E. G. WINDLE, in opening the discussion on Section 56 Madras Forest Act, said: "I will first read the section which as follows:—'When in any proceedings taken under the or in consequence of anything done under this Act, a qu arises as to whether any forest produce is the property of G ment, such produce shall be presumed to be the proper the Government until the contrary is proved.' It is no doub cult for a Forest Ranger or peon meeting a native with a l grass, bamboo, wood, &c., to say that such things are Gover property, however strongly he may suspect it, and in any case would be required before the assertion could be proved, and i meantime the suspected party, probably a travelling cooly, a derer of some description, goes on his way and vanishes fro scene. Therefore, arbitrary as this section may seem, we admi there is good reason in certain cases for its use; in fact, it is similar in its operation to the Coffee Stealing Act by whic possessor of coffee may be called upon to prove his ownershi is obvious, however, that such a section as 56 was never inten be put into operation on the respectable resident, or whether a European planter or otherwise, and until lately in the cou over twenty years' planting experience in various districts, I c recall any case of gross abuse of this section. It has been a used as a means of petty blackmail by forest guards, but I d know that these cases are more common than the exactions by officials elsewhere. I have lately come across a case, however, shows to what an extent this section may be misused. I wi give any names, as I am not seeking your sympathy for an indi case, but I ask for your support in endeavouring to get the s put into such a form that gross abuse of it may no l be possible. A Forest Ranger accused a planter, a Eur gentleman, of cutting reeds in a Government forest. The pl who, I may mention, had specially obtained permission fr neighbour to cut the reeds in question, and who had accord done so on this neighbour's land, denied that he had done wh was accused of, whereupon the Ranger told him that the place the reeds were cut must be shown at once. The planter, wh very busy, said that he could not accompany the Ranger informed him that though reeds had been cut on Government yet some thatching grass had been taken. The Ranger went and the planter's next news on the subject was a letter fro District Forest Officer saying that he would compound the o of cutting reeds and grass on Government land for a certain and if the money was not paid, the Magistrate would be instr to take the case on to his file. The planter replied stating reeds had been cut on Government land, and was ready to pay

er sum was considered right for the grass, which he had him-f pointed out to the Ranger. He also said that he was ready show the place where the reeds had been cut to the District rest Officer or any official whose position guaranteed that the arge was not frivolous, pointing out that Section 56 of the rest Act on which the District Forest Officer took his stand d the planter open to his time being at the mercy of any tty official. The reply to this was a summons to appear before Magistrate in the headquarters station, some 60 miles off, hin an impossible time. In addition to this, and as showing the eat drawback that may follow such arbitrary proceedings, I may ntion that in this particular case the planter was in the middle of planting for the season, and was putting out plants at the rate some ten acres a day. Planters can well imagine the damage to estate which might have resulted had he been compelled to leave h important work for certainly not less than four to five days. rtunately, it was not *possible* for him to attend in time, and he lorsed the summons to that effect. There was some talk of uing a warrant for his apprehension; (I shall remind you that se cases are criminal and not civil,) but better councils prevailed, tunately, and the case was posted to a later date. I should like point out here the very anomalous position which may be occupied the Collector of a district in these matters. The Collector is the cial head of the Forest Department in his district; as a matter of t, the letters in this case were headed "Collector's Office," yet h a European who in a criminal case can only be tried by a ropean, the Collector is liable to be judge of his own case; in the mple in question, the Collector, who nominally had issued the ters on the subject, *was* to try his own case, and, therefore, very perly no doubt actually had to refuse to discuss the facts of the tter with the aggrieved parties. I will say nothing further ut the special example which I have brought forward. As I said ore, I am not trying to enlist your sympathies for any individual. ere are other points in this particular case which would make it pear far worse as an arbitrary exercise of power than I have wn it to be, but as these do not bear upon the principle of the tter, I omit them. I moved that this Association address the dras Government with the view of having Section 56 of Madras V. of 1882 so revised that it cannot be unnecessarily employed inst respectable residents who can at any time be reached by the inary processes of the law. I don't think there is any necessity me to say much more on the subject. I am not asking for one for the European and another for the native, or for one law for rich and another for the poor, but merely that it should not be sible for Forest officials to cause great unnecessary trouble and ense to responsible and respectable men."

Ie accordingly moved: "That this Association address the dras Government with the view of having Section 56 of Madras V. of 1882 so revised that it cannot be unnecessarily employed inst respectable residents who can at any time be reached by the inary processes of the law."

he motion was seconded by Mr. J. W. Hockin and carried nimously.

Shipments of Tea by the S.S. *Nurani*.

Ir. W. L. Edmiston brought this subject up before the U.P.A. mentioned the facts of the case, which were the same as those orted recently at the meeting of the Nilgiri Planters' Association. ne further particulars were elected in Committee, and the follow-resolution moved by Mr. Edmiston and seconded by Mr. H. M. ight was carried:—"It having been brought to the notice of this ociation that a large quantity of tea shipped from the West st Ports by an Asiatic Steamer on Clean Direct Bills of lading London has been detained at Bombay pending a guarantee by shipper against all loss by the carrying lines, this Association do rd their opinion that the action of the Carrying Companies is e unwarrantable."

Votes of Thanks.

Ir. J. W. Hockin proposed a cordial vote of thanks to Mr. erod for the careful and efficient manner in which he has attended our business during the past year, and also to Mr. Ronaldson his able conduct of our business during Mr. Ormerod's absence. Hockin said all who had had experience in their business would ise the extreme importance of having a man in charge of the e who combined extreme vigilance and industry with ability. Mr. Ormerod they had such a man, and he could assure Mr. erod that they were all much obliged to him for having looked after their business. During the part of the ten years that Mr. Ormerod was away, Mr. Ronaldson took charge of the office, and they had the Chairman's testimony and they could not have better testimony of the ready way in which Mr. Ronaldson picked up the thread of their business. I therefore have much pleasure in proposing the vote of thanks referred to above.

Mr. H. G. Parsons seconded the motion.

The vote of thanks having been passed with acclamation, Mr. Ormerod acknowledged the compliment in a few suitable terms.

Mr. Graham Anderson proposed a vote of thanks to the Chairman. He said:—"I cannot expect to find words which will adequately give expression to our feelings of appreciation of the kindness, courtesy, and tact which have characterized the conduct of the meeting by Mr. Romilly, our Chairman. I, therefore, propose that a most cordial vote of thanks be accorded to him not only for all he has done, but for having so generously undertaken the duties of our chief for another season."

The resolution was seconded by Mr. Harris and carried with enthusiasm.

The Chairman's Reply.

Gentlemen,—I am very much obliged, indeed, to Mr. Graham Anderson for the very kind way he has expressed himself, and to you for the way in which you have received it, but you can't add anything by words to the compliment that you have already paid me in again electing me unanimously as your Chairman. I assure you I feel it deeply. There is a good deal of work attendant on the office, but except for this speech-making, which I utterly abhor, I must admit I rather take the responsibility and the work. You may have noticed that Mr. Maclean said the other day, in the House of Commons, that the Viceroy could not order up his dinner without first telegraphing to the Secretary of State to know if he was wanted any more. Well, it is very much the same thing with myself and Mr. Ormerod. I do not leave my estate without his sanction. I am glad to think that this Association, year by year, increases in its power to do useful work, and I hope also that the interest taken in its proceedings will increase not only among the large body of European planters who are never present, but also among that very much larger body of native planters who, for the last two years, have not even been represented. Apart from the political business which we do at these meetings, these interchange of ideas that takes place on all planting matters among gentlemen coming from distances so wide apart and so different a climate and other respects must be of benefit. The informal discussion that we had with Mr. Cameron on the subject of leaf-disease and of improvement of the strain of our coffee was most interesting. It will be very clever of Mr. Bremner if he is able to turn out a connected report of what took place. I noticed once or twice, when more than two gentlemen were speaking at once, a look of hopeless resignation that the pencil became idle. I will take this opportunity of thanking him for the unflagging attention with which he has followed our debates, the debate that arose on the Currency question showed considerable diversity of opinion as to the course which I ought to have adopted. But I am glad to think that my conduct was not so much directly censured, as that was considered presumption on my part to suggest any line of action to the Government of India. Now, Gentlemen, excessive modesty was one of my vices, but I am glad to think that I have lived it down. I now have the courage of my opinions, and I would put them forward so long as I knew that they did not clash with the vast interests of the community which I have the honour to represent at any hazard. I am sorry that Mr. Hodgson's statement for the Commission is not already in your hands. I think you will all admit, when you get it, that it is a most forcible and lucid exposition of our case. We have to thank the Editor of the *Madras Mail* for his courtesy in having gained for us such early information on the subject of the Committee of Enquiry. From the telegram I read to you last night, it is evident that we shall shortly get Government orders, and it is gratifying, at any rate, to know that we are considered to have proved our case at last.

There is one matter that was not on the agenda paper, so I have had no opportunity of telling you about it, but it is that our Secretary has been in correspondence with Dr. Ronald Ross on the subject of malaria, and has received a most interesting private letter from him, which shows that he is making excellent progress in his investigations. I will now, Gentlemen, delay you no longer, but wish you a year of prosperity. I declare this meeting closed.

DISTRICT ASSOCIATIONS.

THE LOWER PULNEYS.

Proceedings of the Annual General Meeting held at the Dindigul ub on Saturday, 30th July, 1898.

PRESENT.—H.W. Gerrard, Esq. (*Chairman*), G. Mengel, Esq., H. R. wport, Esq., H. Ludwig, Esq., E. Morgan, Esq., F. R. Gerrard, q. (*Hony. Secretary*).

Minutes of last Meeting taken as read.

Read Notice calling meeting.

The Chairman called on the Honorary Secretary to read the nual Report.

1. **Report.**—The following report was therefore read :—

ANNUAL REPORT, 1897-98.

n accordance with the usual custom, it is now my duty to lay before the Report of our Proceedings during the past season.

I regret the year has been far from prosperous; the coffee crops for 97-98 have been the smallest on record, and there is no doubt this ort fall was mainly due to the damage done by green bug in 1896. r the present season crops are generally speaking good, as far as a ecast is justifiable at this time, though green bug will undoubtedly some damage, and the failure of the S.W. Monsoon has to be taken o account when crops come to be gathered. Except for the green bug, estates generally on the Lower Pulneys and Siroo Mullay Hills are king exceptionally well.

Roads and Communications.—In October last Mr. H. O. Newport and self, on behalf of our Association, presented a petition to H. E. the vernor in Madura, during his visit there, praying Government to pedite matters in connection with the Ahtoor-Kodaikanal Ghât Road. s Excellency promised to take the very earliest opportunity of attending this particular want of the Lower Pulneys, and, if it were possible, to nt the estimate in the present financial year. I am not at all sure t this has been done. I fear we are to be left in the cold until another ancial year comes round.

Our modest request for the construction of a bridle-path *only* has been fore Government since 1893, and every year since promises have been de, but nothing done; and I remember the only request the landowners d ryots of the Lower Pulneys made to the late Mr. G. P. Clarke, when was carrying out the settlement of these hills, and enhanced the land essments to nearly double what was being paid previous to 1892, was t Government would give them better means of communication with plains, as a slight compensation for the increased taxes they would be iged to pay in future.

n spite of all representations to Government to construct one decent h on to the Lower Pulneys, these hills (except for the ill-kept path m Ardaloor to Punnaputty) remain practically in the same condition as the days of Noah, but we still hope that Sir Arthur Havelock will fil his promise, and that a grant will be made towards the construction this path in the present financial year.

Railways.—Our Association sent a petition in March last, signed by leading merchants, planters, and landholders of all the towns and ge villages between Dindigul and Calicut, praying Government to give ir sanction to the early construction of the Dindigul-Palghat line. reply, we were informed "that the subject continues to receive the nest attention of Government, and that the bringing of the project to ractical issue may not now be very far off."

This line as we all know will pass through a rich and populous country, l will be the most direct line of communication between the Madura trict and the West Coast.

I understand the S.I.R. Company are prepared to at once commence construction of this line, and are only waiting the sanction of vernment. Why this is not given appears to me to be just one of those ny instances where we find the Supreme Government overlooking the ims of this Presidency in Railway extension.

I may mention that this line was strongly recommended by the Railway mmittee in 1873, and by the Famine Commission in 1877 or 1878. A arter of a century has now passed, and the project is still under sideration.

Lady-birds and Coffee Scale.—The green bug which, owing to its ages caused such losses to our crops, attracted a good deal of attention, l was brought prominently to notice by Mr. H. O. Newport in some y written pamphlets, and a lecture at the last annual meeting of the P.A., in which he so clearly pointed out the truly serious state of airs on our hills. It resulted in Mr. Newport being sent to Australia import lady-birds for exterminating all scale pests.

Mr. Newport left our hills for Australia on 28th January, and returned 20th June with a consignment of about 4,000 lady-birds, but unfortu-ely they did not survive the voyage. On opening the cases on Pillavaly ate the lady-birds were found to be dead, and from his official report to the U.P.A., dated 14th July, he is apparently unable to account for the complete failure of the experiment, though no doubt he left no stone unturned to bring this delicate experiment to a successful issue, and I am sure, with him, we all deplore the failure.

This report, together with all correspondence that has passed on this subject, I have circulated to all members of our Association.

No planter who has not seen the green bug on coffee can form the least conception of the awful damage they do.

To state briefly. In 1896, when the bug first appeared on our coffee, about 30 per cent. of the crops were destroyed; in 1897, though the bug was not so bad, the wood was so vitiated that the average crop from every 100 *acres* under cultivation did not exceed one ton. This year the bug is bad again on some estates, and it remains to be seen what loss of crop can be put down to its ravages.

To exterminate this pest we *must* introduce its natural enemy.

Speaking of lady-birds, Professor Koebele, in his report to the Hawaiian Government, says "*when once introduced are an everlasting benefit to the country where introduced.*" Mr. E. E. Green, Honorary Government Entomologist, Ceylon, is getting a consignment of lady-birds from the Cape sent to him in a Wardian case. If his attempt proves successful, efforts will be made by the U.P.A. to obtain experimental supplies from him, and we might, as suggested by Mr. Newport, get another consignment from Australia, especially as Mr. Newport points out the cost will be so small. However, this is a question which is to be discussed at this meeting, and I trust we will be able to decide upon some scheme to be placed before the U.P.A.S.I. to get another consignment of lady-birds.

Our warmest thanks are due to the Chairman, and Secretary, U.P.A., and to the Hon'ble Mr. H. P. Hodgson, for the prompt action taken by them in sending Mr. Newport to Australia, and in their getting the support of Government to the scheme. Our thanks are also due to those District Associations who assisted us with funds, especially the Nilgiris.

Postal.—I fear there is very little hope of a Post Office being opened at Ardaloor, as the Postmaster-General points out that the value returns will not cover the cost of upkeep.

Cattle Trespass on the Lower Pulneys and Siroo Mullay Hills.—This matter has been referred to the Collector.

Taluq Board.—Mr. H. O. Newport resigned his seat on the Taluq Board in January last, and as none of our members cared to stand for election in his place, we are now unrepresented.

U.P.A.S.I.—For the current year we decided to subscribe one anna per acre on all coffee under cultivation towards the U.P.A. Fund. This sum amounted to Rs.61-6-0. But as our Association promised a minimum subscription of Rs.75-0-0, the balance Rs.14-10-0 was met from our current funds.

I need not here touch on any of the subjects at present engaging the attention of the U.P.A. They will hold their meeting in Bangalore next week, when all matters of the deepest interest to the planting community will be fully discussed.

General.—We have twelve members on our roll and six honorary members.

Our labour supply has been fair throughout the year.

The rainfall was below the average, the N.E. Monsoon of 1897 being light, and the S.W. Monsoon of 1898 a total failure.

The health of the district has been fairly good, except for a bad outbreak of cholera during April and May. I think I have touched on all matters which we had before us during the past season.

The accounts show a balance of Rs.19-12-3 to credit.

I now place my resignation in your hands.

FRED. R. GERRARD,
Hon. Secretary,
L.P.P.A., Dindigul.

Mr. Mengel *proposed*, and Mr. Morgan *seconded*, the adoption of the report. *Carried.*

The accounts having been examined were passed.

2. **Lady-birds and Coffee Scale.**—*Proposed* by Mr. Mengel, *seconded* by Mr. Morgan, and *carried*, that it would be advisable to get over another consignment of lady-birds from Australia, and leave arrangements in the hands of the U.P.A.; and suggests that inasmuch at it seems that the failure in bringing the lady-birds alive to Pulneys originated between Colombo and Dindigul, the birds be thawed out on board in Colombo harbour, and put into fresh boxes provided with coffee scale from the Lower Pulneys for them to feed upon, and in this manner conveyed to the hills. The chances of success would be greater if this plan were adopted.

The Association watches Mr. Green's experiments with interest, and trusts one or other of the schemes will be successful.

3. **Delegate to the U.P.A. Annual General Meeting.**—*Proposed* by Mr. Morgan that Mr. H. O. Newport be asked to represent this Association at the U.P.A. Annual General Meeting, and to use his discretion on any subject brought forward. *Seconded* by Mr. H. R. Newport. *Carried.*

4. **Roads and Railways.**—*Proposed* by Mr. W. H. Gerrard that our delegate to the U.P.A. meeting be requested to again bring forward the question of Roads and Railways, and to point out the apparent apathy on the part of the Madras Government with regard to its repeated promises in this connection. *Seconded* by Mr. H. Ludwig. *Carried.*

5. **Police Station at Kongaputty.**—Mr. H. R. Newport *said*, since as far as this Association knows, the total number of policemen on the Lower Pulneys amounts to nine, which number is evidently entirely inadequate either to protect the large and valuable properties in this district, or to cope with the work consequent on the amount of crime. *Proposed* that this Association do request the Honorary Secretary to state the case to the proper authorities and request that the number of Police be increased, and a station established at Kongaputty. [*Kongaputty is a large village on the hills between the large coffee estates of St. Mary and Munaloor, and is 9 miles from Iyempollium (on the plains), 9 miles from Ardaloor, and 15 miles from Tandigudy.*] *Seconded* by Mr. F. R. Gerrard. *Carried.*

6. **Coffee Stealing.**—*Read* Circular letter from the Secretary, U.P.A.S.I., dated 4th July, 1898.

Proposed by Mr. F. R. Gerrard, *seconded* by Mr. G. Mengel, and *carried*, that each district, with the assistance of the Police, work out its own scheme for the prevention of coffee stealing, as has been done so successfully by the Wynaad Association.

7. **Subscription to the U.P.A.S.I. Fund.**—It was resolved that the subscription to the U.P.A.S.I. Fund for 1898-99 be fixed at Rs.50.

8. **Agricultural Chemist.**—*Read* letter from the Secretary, U.P.A.S.I., dated 23rd July, 1898.

After discussion, it was decided that our Association is not in a position to subscribe towards the salary of an Agricultural Chemist.

9. **Correspondence** *re* "Post Office at Ardaloor"—"Government purchases of Cinchona"—"Dindigul-Palghat Railway"—"Currency"—"The Diamond Jubilee Casket"—*Planting Opinion*—"Registration of the U.P.A.S.I."—"Coffee Stealing"—"U.P.A.S.I. Annual Meeting" were read and recorded.

At this stage the Chairman and office-bearers resigned, and Mr. Mengel was voted the presiding Chairman.

Proposed by Mr. Morgan that the same office-bearers for 1897-98 be requested to take office during the current year. *Seconded* by Mr. H. Ludwig and *carried.*

The meeting closed with the usual vote of thanks to the Chairman.

W. H. GERRARD,
Chairman.
FRED. R. GERRARD,
Hon. Secretary, L.P.P.A.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (*July* 22, 1898) says:—A quiet tone continues at Public Sales and the supplies brought forward met a poor demand, a good part being bought in.

About 430 bags East India were offered, chiefly greyish and brownish descriptions, and met very little competition a few lots selling at easier rates.

Costa Rica, which formed the bulk of the sales, sold slowly at 1/- decline for common and greyish grades, but colory Guatemala realised full value.

Futures have been very quiet with only a small business passing, and the market has dropped 3*d.* to 6*d.* since our last closing steady at the decline.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Week ending July 20th, 1898, says:—Bank rate 2½%. Bombay Exchange closes at 1s. 3⅞d. Brazil Exchange 7⅜d. Rupee paper 3½% 63½. Silver 27 7/16d. per oz.

This market has again been very quiet throughout the past week, the unimportant supplies catalogued meeting with a slow demand, except for the very small proportion of fine which sold well. East India was only partly sold at somewhat easier rates. Brazil markets are very quiet.

Daily receipts averaged 10,300 bags in Rio, and 14,700 bags in Santos.

Futures have been quiet and lower, closing at about 3d. to 9d. per cwt. decline, viz.:—Good average Santos in Havre, September delivery, fcs. 35.00, in Hamburg pf. 29¼, and No. 7 low ordinary Rio in New York $5.45.

To-day's London official quotations are:—

	July	Sept.	Dec., '98.	Mar.	M

} Total 34,177 packages were offered in auction this week.

The following table shows that during the first six months of thi the exports from Ceylon have been nearly one million pounds mor last year. It is pleasant to note that owing to the expansion in F Markets not only has this increase been diverted from London, bu ments to the home market are two millions less than during the period last year. The great increase in the shipments to Russia, Au and America is a most gratifying feature.

Exports from Ceylon from 1st January to 30th June, durin years 1898, 1897, 1896 and 1895.

Indian. Again supplies have been small and insufficient to attract buyers. A few fine parcels of Darjeeling Tea were well competed for, but the bulk of the offerings sold at irregular prices. The official wire from Calcutta gives exports to U. K. for the first half of the month as 1,600,000 lb., against 6,550,000 lb. last year. Exports to U. K. from 1st April to 15th July, 18,097,000 lb., against 16,499,000 for same period last year.

THE MADRAS EQUITABLE ASSURANCE SOCIET

(SUCCESSOR TO THE MADRAS LAUDABLE SOCIETY, ESTABLISHED IN 1829.)

Regulated by Act No. VI. of 1869 of the Legislative Council of Fort St. Geor

Invested Funds exceed ... Rs.22,00,000 | Gross Annual Income exceeds ...Rs.3,00,000

BOARD OF DIRECTORS.

C. E. P. VANS AGNEW, ESQ., (Arbuthnot & Co.,) Chairman.
SUTHERLAND ORR, ESQ., (Barclay, Orr & David.)
W. GORDON, ESQ., (Mercantile Bank of India, Ld
A. ROBERTSON, ESQ., (National Bank of India, Ld
R. J. BLACK, ESQ., (Best & Co.)

Medical Adviser.—Surg.-Lieut.-Colonel A. J. STURMER.

Actuary—RALPH P. HARDY, Esq., United Kingdom Temperance and General Provident Institution.

The chief characteristics of this Society are:—

Mutual Assurance; consequently all surpluses are divided among the lives assured exclusively.
Immediate payment of death claims, an official notice in any of Her Majesty's Government Gazettes b sufficient proof.
Surrender value allowed for Life Policies issued at fixed rate of premium, on which 3 years' premiums have b paid.
Agency in London for receipt of premium and for payment of death claims.
On Policies transferred to the London Register, or death claims will be paid in England at the current excha on Madras without production of Indian Probate or Letters of Administration. Premium may be paic London at 2*s.* per rupee or it may be remitted direct to the Secretaries and Treasurers by Demand Dr on Madras.
The Society's Funds invested in India Government Securities only.
Directors must be residents at Madras.
Members consist of all holders of policies either on their own lives, or on the lives of others, for the dura of life.
General Meetings held Annually—not later than the end of March, in every year.
Auditor elected by Members. Accounts audited Annually.
Valuation of Society's affairs must be made quinquennially.
The reduction for the quinquennium 1896—1900 is at the rate of 75 per cent. of original Annual premiums p during 1891—1895. Thus the premium on a policy for Rs.10,000 on the life of a person, aged 34 ye Civil Rates, on which the original half-yearly payment was Rs.225 during 1891—1895, is reduced to Rs.56-4-0, or say, to one-fourth of the original half-yearly payment during 1896—1900.
Term Policies issued at moderate, non-participating Rates.
The Medical Adviser sees applicants for Assurance at his residence, Pantheon Road, Egmore, on Wednesd and Saturdays, between the hours of 12 and 2 P.M.
For Prospectuses, forms of proposals, &c., apply to

ARBUTHNOT & CO.,

Secretaries and Treasurers.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, ght Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including stage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for e advertisements will be: 4 as. per line for the first, 3 as. for the second, d 2 as. for the third and succeeding insertions. Five-line advertisements m Subscribers will be inserted for three issues for one rupee; non-Subribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic currence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," /12, Second Line Beach, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been moved to Madras, all remittances should be made payble to the Manager of *Planting Opinion*, 11 and 12, econd Line Beach, Madras, who will also attend to all dvertisements, &c.

Letters to the Editor should be addressed to Coonoor, usual.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 26th August, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Polli Betta, 17*th August.*—*Weather.*—About 40 cents on 6th; 10 to 15 on 7th; no rain till 13th, when 30 cents fell. 5 cents next day. 15th no rain; 16th 70 cents. Total to date about 33 inches odd. About 15 inches below average to date. *Plant-diseases.*—Removing and burning borer about finished. Leaf-disease only showing up in patches with clammy soil in poorish coffee. *Works.*—Supplying about all finished. Weeding, handling, and digging going on. *Labour.*—Sufficient. *Health.*—Good.

Nellampathy (British).

17*th August.*—*Weather.*—Very fine; the rainfall during August has been light, but very suitable for planting. Just at present there is a break, and we have had no rain for the last three days, but with such a light monsoon as we are having, a break is not so welcome as it usually is. August rain 7·82, total for year 77·85. *Crops*—Are showing up well, and very little being lost through dropping off, as so often happens in the monsoon. *Plant-diseases.*—Comparatively little about: only on some places is "leaf" at all bad, and on these it is *very* bad indeed, but on the majority there's very little showing. *General Health.*—Fair, improved somewhat this month.

Nilgiris.

Kil Kotagiri, 15*th August.*—*Rain.*—We have at last had a small shower. I am afraid it must have been very local. On one estate it was 35 cents, another 60 cents, and two miles away 5 cents. We hope for more. The general work is watering the trees, and every day oil tins come up the ghât from Mettapollium. *Crops.*—A few berries ripening here and there; picking will be early. Heavy crops are the rule this side. *Labour.*—Ample. *Grain.*—Still high.

THE LABOUR QUESTION.

AT the U.P.A.S.I. meeting the Chairman announced on Wednesday evening (10th instant) that he had received intimation (1) that the Government of India had acknowledged that South Indian planters had made out a case before the Southern India Planters' Enquiry Committee, and (2) that orders might be issued any day. Later in the proceedings, he thanked the Editor of the *Madras Mail* for the information given by him on this subject, thus showing that what he had referred to was what appeared in the *Mail* of 10th instant as a telegram from Simla in the following terms: "The recommendations of the Secretariat here on the subject of the Southern India Planters' Enquiry Committee are now before the Viceroy's Council, and orders may issue any day. I understand that the authorities are agreed that the case for action of some kind, on behalf of the South Indian planting community, has been made out. It is possible, therefore, that the recommendations of the Madras Government for a Provincial Labour Law in the Local Council may be adopted." As far as it goes, this news is decidedly good. In the first place, it is something to have an admission on the part of the Government of India that a case has been made out. The chief point for concern, however, is—how that case is to be met. The recommendations of the Madras Government appear likely to be taken as a basis, not the recommendations of the Committee of Enquiry; and it is not clear that the two are identical. Then, too, a Madras Labour law alone would be of no use to the large planting communities of Coorg, Mysore, Travancore and the small one that finds a home in Cochin. No doubt, however, it is the intention of the Government of India to invite the Native States concerned to adopt the amended law, as was suggested by the Committee. That they would do this gladly, if the new law were such as planters desire, there is little doubt. Hence, it is of interest to consider once more the recommendations of the Committee, in the hope that they may give some idea of the course that is likely to be adopted. These recommendations are summarised in the Committee's report as follows:—(1) That Madras Act V. of 1866 should be amended so as to provide a suitable labour law for all the planting districts in Southern India. (2) That the question of declaring Act XIII. of 1859 to be inapplicable to contracts for labour governed by the amended Act should be reserved for consideration. (3) That the Native States of Mysore, Travancore and Cochin should be invited to adopt the amended law. (4) That the execution of the amended law should be made reciprocal between the Madras Presidency and Coorg on the one hand, and the Native States of Mysore, Travancore and Cochin on the other, by a convention or mutual agreement. (5) In default of a convention—(*a*) that British Magistrates should be empowered to give effect to orders of certain Magistrates in Native States in respect of fraudulent breaches of contract under the amended law, or if there is no amendment under Act XIII. of 1859, or preferably (*b*) that Magistrates in British India and in the Native States of Mysore, Travancore and Cochin should be empowered by their respective Governments to deal with persons found within their jurisdiction who commit fraudulent breach of contract (as above explained) across the border. (6) That in the event of either of the above suggestions 4 or 5 (*b*) being accepted, the Mysore State should no longer be exceptionally tr in respect of British processes in breach of contract ca

Comparing this with the news from Simla, Nos. 1, 2 a are of the greatest interest. It is clear that the M recommendation is not likely to be based upon Act XI 1859. We must, therefore, fall back upon Act V. of This was intended "to regulate the manner of engaging contracting with Native inhabitants within any of districts subject to the Government of Fort St. Georg labour to be performed in any part of India beyon territorial limits of the Presidency of Madras." In respect it is just what is wanted. Let us see how it e its purpose. The Committee of Enquiry summarise follows:—The definition of the word "contractor Section 1 includes planters and plantation maistries; S makes contracts for labour in any part of India be the territorial limits of the Madras Presidency unl unless entered into in conformity with the provisio the Act; power is given to the Madras Governme Sec. 3 to appoint protectors of labourers, whose duti indicated generally in Section 4, and, as regards em tion by sea, in Section 14; rules for licensing contra and recruiters of labourers, for the registration of labo for the payment of fees and, if considered necessa the protector of labourers, for the establishment of d are laid down in Sections 5, 6, 7, 8, 9, 10, 11, 13 an penalties for breaches of the rules are provided in Se 16, 17, 18 and 19; Section 20 lays down the procedure adopted in prosecutions under the Act, and by Secti the Act came into force on the 1st November, 1 As regards the scope of the Act, the Select Comm appointed to report on the Bill said:—"It has appear us desirable that the provisions of the Bill should be a cable, not only to cases in which labourers may be eng for employment in such places beyond the territorial l of this Presidency as are under the direct governme Her Majesty, but also to cases in which the engagem may be for labour to be performed in any Native Sta foreign dependency in India, such as Travancore, Co Mysore, Hyderabad and the French Settlement of P cherry. We have, therefore, substituted the word 'I for 'British India' throughout the Bill, and insert interpretation clause defining the former term as incl all Native States and foreign dependencies withi territories vested in Her Majesty by the Statute 21 a Vic., Chap. 106." Finally, the Committee expres opinion that it is clear that Madras Act V. of 1866 law which ought to regulate emigration from all distri the Madras Presidency to Coorg and to the Native S of Mysore, Travancore, and Cochin. The most curiou of the matter is that planters, with few exceptions, nothing of this Act until the above report appeared that the Act has long been a dead letter.

The grave defect of Act V. of 1866 is, in the wo the report, that it "cannot be utilised in regard t labour employed on plantations within the Madras P dency, and its rigid enforcement, as regards the l employed in Coorg and the Native States of M Travancore and Cochin could only result in disaster t planting interest in those tracts, unless it were also applicable to the labour employed in the Madras Presi itself and to the labour exported from the Madras Presi to Ceylon, the planting interest in which enters

petition with the tracts mentioned." Further, its provi-s would scarcely give any relief, inasmuch as the provision Section 12 only applies to the case in which a labourer nout good and sufficient cause refuses or neglects to ceed to the place at which the contract is to be performed, does not reach the labourer who, having proceeded to n place, subsequently breaks his contract or otherwise ls fraudulently with his employer. Finally, several of provisions, as they stand, are inapplicable to the mode ecruiting in force for the tracts in question. In spite nese flaws, it is this Act that we hope to see amended and n put in force. Side by side with it, however, there uld certainly be a Convention with respect to reciprocity veen the Administrations of the British and those of the ive territories concerned.

SCIENCE IN PLANTING.

HE U.P.A.S.I. has urged upon the Governments cerned that an Agricultural Chemist is required for the dras Presidency, and another for Mysore and Coorg, if for Coorg alone. As regards the Mysore appointment, nay be taken that the applicant whom the Mysore bar has in view is likely to prove thoroughly competent. testimonials he has submitted are of an altogether ptional character. As regards the Madras appointment nould it be decided to make one—a selection still ains to be made. Bearing this in mind, we would call readers' special attention to what was recently said by Rt. Hon. A. J. Balfour, M.P., in an address delivered at 's Hospital. He made reference to the way in which growth of scientific knowledge actually puts difficulties ne path of its further increase. As our attainments in nce extend, so do the artificial barriers separating one ience" from another become less and less substantial, the more difficult it is to acquire a competent know-e of any one without a knowledge of others which ments *pari passu* with the knowledge which may pass competent in the particular science which the student selected as his *magnum opus*. At the same time our wledge of any one science can, as a rule, only be extended abours which are highly specialised, usually confined ed to a branch of the one science which is small in com-son with the whole subject. Thus on the one hand we e a demand for specialisation before research can be quately undertaken, and on the other hand the fact that mount of knowledge which cannot be acquired without de range of study is necessary to make the student of nce fit to embark in research with any reasonable hope uccess. Mr. Balfour considers that the only remedy this is the endowment of research. Men who have ed, as far as may be, a comprehensive knowledge of nce by assiduous work during the earlier years of their er, and who show the possession of the necessary genius original investigation, must be enabled to devote them-es wholly to such work, saving only such time from r specialised endeavours as will suffice to permit them to abreast of the general increase in the knowledge of ters bearing specially upon their own particular labours, must be absolutely exempt from all necessity of actising" any scientific profession for a livelihood.

here is no doubt that the endowment of research is very desirable and should prove of great service. But we should like to point out that the establishment of such appointments as Agricultural Chemist and State Entomologist, Quinologist, Botanist, etc., is but one form of such endowment, and a form of the most practical kind. Scientific research into agricultural matters *in England* can never be relied upon as an unfailing guide in regard to matters agricultural *in India*. What is wanted is not merely scientific study but practical experiment, and this near the scene of the operations of Nature that have to be studied. If the Governments of Madras and Mysore appoint the experts that the U.P.A.S.I. says are needed, they will, in effect, endow scientific research, and arrange for the conduct of such research under exceptionally favourable circumstances. It is instructive to note that such Governments as those of Queensland and Cape Colony have State Entomologists, that Jamaica and Ceylon have seen the necessity for following suit, and that India has still no official specialist to study the characteristics and peculiarities of its myriads of *poochies*.

NOTES.

A Tea Expert. Our Northern friends are beginning to agitate for a Tea Expert, and want the Indian Tea Association to "import" him.

Tea Pruning. Elsewhere we publish *in extenso* the article on tea pruning referred to in our last issue. We are indebted to the *Tropical Agriculturist* for the paper.

"Serdang" and the Liberian Coffee enterprise. In another column we print an interesting letter on this subject, which will be of general interest to coffee planters. We have to thank the *Ceylon Observer* for the excerpt.

The "Planter's" Prize. In accordance with the suggestion of a correspondent, the *Planter* has altered the terms for the essay on "Which is the oldest Tea Garden in India?" Instead of competitors being restricted to one thousand words, the terms now are "for an article of 1,000 words or more."

The Lantana Bug. A valued correspondent from Kandy writes:—

The Lantana Bug is beginning to attack tea here. Willis, Director of Peradinya Gardens, is warning men about it (E. E. Green noted it five years ago), but says it does not attack tea. It's gone slightly, however, for the tea near Gampola. It is a mealy beast, something like mealy bug, and may prove an awful pest.

Indian Markets for Tea. We reproduce in another column an interesting article from *Capital* on this subject. The idea is a good one, and should be extended over the whole of the Railway system of India. Were a good commission offered to the sundry refreshment-room contractors, they would undoubtedly take an interest in pushing sales.

Natal Tea. We have often ridiculed competition from Natal, but that colony is seriously attacking the London Market, having opened an

office at 34, Great St. Helens, for the sale of Anti-Dyspeptic Natal Teas. These teas are supposed to be free of tannin and all other so-called harmful ingredients. How do they do it? We need not fear serious competition if all the poisons which make tea *tea* are absent.

United Effort. This is the subject of a leading article in *The Planter*, and the U.P.A.S.I. goes on giving practical illustrations of the benefits to be derived from united effort on the part of the planting community. Our contemporary remarks that "the first necessity is for *unity* and *organisation* of those interested." This is said chiefly with reference to the desirability of trying to open out new markets, but it applies just as much to other branches of work. "A long pull, a strong pull, and a pull all together, boys," is what is wanted.

American Tobacco. The July crop report of the United States Department of Agriculture says as regards tobacco :—There is a marked increase in the acreage of tobacco in nearly all the States of principal production, Kentucky reporting an increase of 8 per cent., Virginia 4 per cent., Tennessee 15 per cent., and Ohio 7 per cent. There is a reduction of 6 per cent. in North Carolina and of 12 per cent. in Florida. The average condition is much better than at the corresponding period last year.

To brew good tea. The following recipe was written by the Chinese Emperor Kien Long, who died in 1799 A.D., and certainly holds good to-day :—

Place over a gentle fire a well-seasoned and long-used vessel filled with the pure water of melted snow. Boil it long enough to turn a lobster red, and then pour it upon the leaves of the choicest tea in a teapot of the finest porcelain. When the thick cloud issuing from it becomes a fine mist floating upon its surface, pour it into the cup and drink it off. This precious liquor will drive away every care. The delicious state of quietude produced by such a beverage must be felt and cannot be described.

Novel Tea Advertisements. Several million wooden toothpicks bearing the words "Drink Ceylon and Indian Tea" printed on them ; and one "Electric Shirt Front," with a wearer attached. The wearer is in evening dress and has a silk hat and a "diamond" stud at his bosom. The stud is the point of the joke : when the light is turned on, the words "Drink Ceylon and Indian Tea" come out in gold letters across the shirt-front with, as Mr. Blechynden puts it, "quite a startling effect." And "it has been most telling in the J quarter" of New York!

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton :—

61·50 lbs. Nitrogen.
57·38 „ Potash.
14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

The Government Botanical Gardens and Parks, Nilgiris. The annual administration r for 1897-98 has no special in for planters. Acting under c issued last year, Mr. Proudlock Curator, has carefully excluded "all scientific mat and has merely reported on "the development an provement of the gardens entrusted to his charge." the Government is now annoyed because the Collecto passed the report on "without remark." As a matt fact, the Government Order referred to has cause report to be almost unworthy of remark.

The cocoanut in rhyme. Messrs. J. & M. L. Tregaski well-known antiquarian bookse of High Holborn, Calcutta, had lately a carved cocoan sale, described as follows :—

1950—Cocoanut Flask, carved, with stopper, 7 inches high, 1 On one side a lady with a bottle, parting with a soldier hol glass, beside a ship ; on the other, an elephant with rajah in h and other figures, royal crown and Ceylon. Also the verse :

The mother of me is a cocoanut tree,
Her liquor is excellent sound ;
Arrack and toddy proceed from her body ;
So drink and be merry all 'round.

Old Tea and Burning. It would be worth the wh those owning abandoned or abandoned tea to try this method of rejuvenating bushes. On an estate on the Nilgiris we visited not ago, an acre and a quarter were entirely burnt out tog with a heavy jungle growth. There is not now a s failure amongst the bushes, but should this method be careful pruning after the fire, manure, and a deep for are the means to obtain an entire success. By ca pruning, we mean that all scorched or burnt wood sh be cut to the ground, and the bush entirely reformed, it will be found that the new shoots almost entirely pr from the root.

Who is he? The *Planter's* "own" on the giris is a bit of a curiosity in his He states in *one* letter (1) that South Indian planter "all at once asked to support" two Agricultural Chem one that the Mysore Durbar is getting out for the planters of that province and another that "Mr. Stone coffee curer of Coimbatore, has engaged more particu to aid his firm in its chemical-manure branch of busi (2) that "Mr. Ackworth, from the Wynaad, has been b the Commission sitting in London ;" and (3) tha Hon. Mr. Hodgson's evidence was not accepted, thoug went home with the object of tendering it. Three p bad shots! There is no occasion for us to italicis blunders.

Vanilla. A correspondent, writing t *Ceylon Observer* on this su says that the actual growing of the plant and ferti of the flowers are quite simple, but warns planters tha curing is a ticklish operation, as the Ceylon climate fa mouldiness ; and vanilla tainted by mould fetches no prices, say 3*s.* or so per lb., whilst the properly cured a

tches 19/ to 22/ per lb. Much care is also required to bring
t the aroma, and to so conduct the "sweating" stage
to produce the "frosted" appearance which is taken
a great extent as the criterion of quality. The same writer
ys there has been a serious drop in prices during the past
ear, viz., from 32/ to the price mentioned above, and that
e cultivation can be easily overdone, as there is only a
ery limited market.

---

rices of tea and exchange, &c.

A correspondent of our contemporary, the *Planter*, makes some very interesting remarks anent the
gh average obtained by the Chamong Tea Estate, viz., s.1-1-8 for 163 half chests. Instead of worrying about xchange and home charges, he suggests a greater effort in eeping up a high average in spite of climatic and other fluences. It is a curious fact that up till now very few oncerns are able to make a high quality tea uninterruptedly roughout the season, and what is wrong with our cultivaon and manufacture that we are unable to do so? Our ontemporary suggests that this would make a capital subject r a prize essay, as the subject must ultimately be faced, planters cannot continue to make a lot of undesirable a which sell at unremunerative prices.

---

ublic Accountants.

Madras has had Accountants before now, but only lately has a
rm of duly-qualified Accountants been established in the lace. Mr. Edward Ronaldson went to England a few onths ago, and having passed the necessary examinations, as admitted an Associate of the Society of Accountants and uditors. He has now returned to Madras to co-operate ith his brother, Mr. Allan Ronaldson, who is also an Assoate of the above Society. Messrs. Ronaldson and Ronaldon are thus "Incorporated Accountants," and the long xperience of the senior member in audit work will be well pported by his partner's mercantile experience. The rm has a strong connection already among planters, so hat estate accounts are no new thing to it; and any lanter who wishes his accounts put, or kept, straight may afely entrust them to this firm's care.

---

ea Crops.

We think it would be of general interest to those interested in tea
planters would let us know the date, when half the crop considered to be harvested, both on the plateau of the Nilgiris, the high range estates in Travancore, and in he Wynaad and other low-lying estates. In Assam, we elieve, the 28th August is the date generally adopted for nally estimating the crop, half then being considered ropped, and a knowledge of an approximate date down outh would be useful, not only for reference, but of great tility to those who are close pressed and draw advances gainst probable outturn. Coffee can generally be estiated by sight, after once the berries have begun to form, ut the same does not apply to tea, and the information we sk for might save many from unpleasant correspondence ith agents at the close of the season.

---

orrespondence with "Planting Opinion."

A correspondent to our contemporary, the *Planter*, writes as follows: "Money makes the mare to go, and if sufficient inducements were offered, I think many lights, at present hidden under a bushel, would come forth and shine brilliantly. The industry does not know of the talent it has in its ranks. Let it put it to the test in the manner suggested, and I feel sure great will be the surprise. Oil the lamps, and then they will burn brightly." We have anticipated the above some weeks ago, by offering to subscribers a *quid pro quo*, for the efforts they may make, in placing before their brothers the results of their experience in the very many intricacies connected with tea, coffee, sport, or in fact any matter connected with a planter's life. If our correspondents are not adepts at conveying their thoughts in such a way as may be acceptable to the reading public, we are also willing to accept notes, which we will work up; but this, by experience, is the exception, and if only the talent amongst us would give us the support we expect, it would make our paper far more interesting, and would be a "side product" to many of our friends, who in these times of high exchange and low prices occasionally find that "times are hard." Altering the quotation from the extract we commenced with, we repeat, "*Oil the lamp and we* WILL *burn brightly.*"

Tea & Coffee Markets.

At the last London sales before the mail left, there was a somewhat larger and more varied assortment of Indian teas, writes the *Produce Market Review*, "and, on the whole, a little improvement in quality can be reported, especially in Assam and Dooars growths, a few parcels from these districts having attracted attention. The bulk of the parcels were, however, neglected, being thin liquoring kinds without character or strength, and prices for these were irregular. Darjeelings were more liberally offered, and as the Teas were more attractive than the earlier shipments, they fetched firm prices. A large proportion of the sale consisted of Calcutta-bought Teas, both old and new season's; these were difficult of sale, and previous rates were barely realised. Competition was brisk for Travancores, both Leaf and Broken descriptions showing good value, as compared with Assams at similar prices. At the sale held yesterday in Calcutta, we learn that about 18,000 packages were offered. Calcutta exports for the month of June were 8,790,000lb. against 6,760,000lb. for the same month last year, making 11,500,000lb. to date for this season compared with 9,940,000lb. in 1897. The quantity offered here at public sale was 12,844 packages, of which 8,000 were new season's."

Coffee.—With increased daily receipts in Rio and Santos there has been less desire to operate, and quotations in the terminal market have shown some weakness. The increase in the receipts is due to the arrival of the new crop, and though no fresh news has been received, it is generally accepted that the crop will turn out somewhat less than the last, but will still be a heavy one, and the Brazilians naturally show a decided desire to sell. At the auctions the demand keeps slow, though there has been some improvement from the Continent for the better grades. Rather more business has been done in East Indian at better prices than were obtainable a month ago, and the opinion gains ground that in the autumn this and other fine growths will be wanted. A few lots of Plantation Ceylon fetched extreme rates, while Costa Rica has sold at full prices for the finer qualities, and the lower kinds remained steady.

GENERAL ARTICLES.

OXIDATION AND FERMENTATION.

ON this subject there is considerable correspondence going on in the planting papers. Our own idea is that everything should be done to procure a complete oxidation and prevent fermentation. Oxidation is a natural chemical process. Oxygen is Nature's policeman, and enters into every feature of Nature's economy. "Bamber" says the colour we so much desire before firing is due to the presence of oxygen, and if this gas is not present, he asserts that the necessary colour is absent; in fact, withered leaf, put under a receiver with the air exhausted, retains its original colour after twenty-four hours; also the infusion shows that little or any of the astringent properties of the leaf have been destroyed.

As all planters are aware that the London tea tasters have altered their methods, and prices now are almost invariably fixed only by nose and sight, it seems to us, though we do not wish to lay down the law on the subject, that what we have stated proves that oxidation, *not* fermentation, is the method to be adopted by those who study the means of obtaining high prices and thus improve the status of South Indian teas.

Everything possible ought to be done to eliminate "rubbishy" teas from the market, as at present the large quantity of low grades is proving seriously detrimental to the high standard expected by "Mincing Lane" from Indian and Ceylon districts.

THE LANTANA BUG.

FOR a very long time past "Lantana" has been a bugbear to planters when once it has asserted itself, notwithstanding the very few advocates it had in its favour, but now that the bug which hitherto has made the Lantana its special preserve has shown its intention of transferring its favours to tea and coffee, the obnoxious shrub known botanically, we believe, as *Lantana aculiata* should receive a very short shift, and be made the object of a special crusade. Elsewhere we publish remarks from a Ceylon correspondent showing that the pest has already extended its ravages to tea, so a very serious menace is facing Southern India planters wherever the shrub is existing.

The authorities of the U.P.A.S.I. have already extended a willing hand to import "lady-birds" to exterminate scale pests, and in these troublous times every effort should be made to cope with a new enemy before it makes a hold on one or every of our industries. In earlier days we wer prepared for, neither did we expect these jungle pes leave their aboriginal haunts and attack our cultiva but with the experience we have since gained, that cul tion attracts all jungle parasites and poochies, and more havoc amongst the richer fed and cultivated bu than those which it can feed on in the jungle. It beh all those who care for and attend to their own interes take the necessary steps to prevent the incursion of a enemy which has so insidiously asserted itself in our m and exterminate *Lantana aculiata*, the bane of every e where it has once taken a firm hold.

With the many and awful pests we have to deal many of which have not as yet reached South India necessity of combating a new enemy is evident. We been spared mosquito blight and other blights prevale Assam, Cachar, Darjeeling, and the Dooars, but they, o other hand, do not know of "flush worm," commonl called, but the Lantana shrub is so diffused throughou whole of India, that it threatens red ruin unless kno on the head in its initiatory stage, and prevented becoming the same bane that many of its *confrères* become, by insiduously asserting itself, and not b dealt with till it has assumed proportions which pre its extermination.

HOW TO VANQUISH THE MOSQUITO.

ACCORDING to an American paper, *The Public Health Journa* dreaded mosquito, which is such an intolerable nuisance i summer months, more particularly along river-banks and o seacoast, can be easily abated by the use of a very simple re It is stated that but two and-a-half hours are required for the lopment of the full-grown mosquito from a mere speck, its first s It can be instantly killed either in its infancy or at maturity by tact with minute quantities of permanganate of potash, the cheap p salt which is used so much for disinfecting purposes. It is said a solution of the salt containing only one part in fifteen-thousa water, distributed in the marshes where the mosquito breeds, render the development of their larvæ impossible. To quote journal itself: "A handful of permanganate will oxidise a ten swamp, kill its embryo insects, and keep it free from organic m for thirty days at a cost of twenty-five cents. With care, a state may be kept free of insect pests at a small cost. An effica method is to scatter a few crystals widely apart. A single pin permanganate has killed all the germs in a thousand-gallon ta *Chambers's Journal* for August, 1898.

A RECORD SALE IN "RED TEA LEAF" AND THE HISTORY THEREOF.

THE following from the *Ceylon Observer* is a cu instance of "doctors disagreeing," or Oriential and Lo brokers taking a different view of the value of tea, ra "stuff." It would have been interesting to see the b brokers' report:—

"You are a steady denouncer of the shipper of 'rubbishy and in that I agree with you. Yet I have humbly to confess t have been in the London market with rubbish, and come out way that has surprised me. My 'flutter' was forced upon me, had shipped good Broken Pekoe, and while it was in Colom presumedly between the store and the wharf—some of the c were tampered with, emptied of their contents, and a vile samp red leaf and dirt was substituted. I was not the only sufferer; marks were treated in the same way, and the thing was don neatly that it was only by very careful examination that it exter became evident that the chests had been opened. The lead i was cut, and left unsoldered. A sample of the 'muck' was forwa

me from London, and instructions asked for: Would they it, or what? I naturally grumbled a good deal, for I made sure t the loss would have been less had the chests been walked off h for good, but to be filled up with a kind of no quality tea, and which I would have to pay the usual shipping charges, etc., was e adding insult to injury. What to do with it? That *was* a question, l I expected to see my estate mark with a sale of Broken mixed at . or 2*d.* a lb. and to read again a burst of indignation from various rters on the iniquitous cut-throat policy of shipping rubbish and oiling the face' of Ceylon teas. So I replied to my London nds that I left the problem with them; they could sell it or ndon it if they liked, but they were to take no course that would d me in any extra expenses, and there I left it. Fancy my astonish-nt to get by the mail just in a memo. of sale for this unique thing teas—and 4¼*d.* landed! I am sorry I threw away the samples ich were sent me, for I am sure the all-seeing editorial eye if it l seen them would have admitted that here was (and at the price) nething it had never seen before. Four-pence-farthing for such ff is surely a thing only to be dreamt of!! Who could be the vers of this undrinkable stuff and how could it be utilized?"

P.S.—I find that my tea maker *has* kept back a sample of the roken mixed' which I told him to throw out. So I send it for pection."

Messrs. Somerville & Co. have been good enough to report on the mple sent us as follows:—"Brownish flaky mixed dusty; liquor ry common. London value 2*d.* Colombo equivalent at exchange 4¼*d.*=6 cents." This increases the mystery of the London sale 5¼*d.*? We trust this will not be taken as an encouragement to go for the shipment of "rubbishy tea" worth 1½*d.* to 2*d.* in the hope "landing" 4*d.* to 4½*d.*!—a trade which undoubtedly the full olition of the tea duty would be apt to foster. There is, however, chance of getting rid of this duty save by gradual steps—the st probably being a reduction from 4*d.* to 3*d.*; then another year om 3*d.* to 2*d.*; and then, after an interval, total abolition.

DISTRIBUTION AND SALE OF TEA.

ANENT our remarks last week on this subject, the follow-g from a Ceylon exchange may prove of interest:—

It is well to remember how Ceylon tea first came into notice in the ited Kingdom. The prejudice against it in Mincing Lane was ry great; it is always so at first with reference to any new depar-re in an established trade. Samples or shipments of any product ntified with certain regions, coming from a previously untried ntry, are viewed with suspicion, and brokers and buyers were far m favourable to Ceylon tea at the outset. The distributing uses and middlemen would have nothing to do with it. How then s a demand created? It is not too much to say that a thousand or re Ceylon planters did this effectually by sending sample chests half-chests to their relatives—parents, cousins, aunts—all over e Kingdom, and instructing them how to make and enjoy this new a, and then to insist on getting no other but Ceylon tea from their ocers. That speedily created a demand which had to be supplied, that for some years the shipments from Colombo were not equal to e requirements of Mincing Lane. To hasten the distribution, oreover, a considerable number of retired coffee planters or other lonists became agents for certain tea estates and supplied the local llage grocers, or families, taking a chest or half-chest at a time. ll this speedily created a revolution in the tea trade: "Chinas" ere everywhere decried in households that had become accustomed the superior flavoured "Ceylons," and Indian teas also greatly rofited by the change in public taste originally started by the action a thousand or more planters out in Ceylon.

Now the problem before us at the present time is whether some tion cannot be taken to meet and overcome the present crisis milar to that effected a dozen or fifteen years ago. The trouble is w that, while Ceylon and Indian teas command the United King-m and the people are willing to pay a fair price for a good tea, eir taste is being gradually spoilt by very inferior mixtures, while, the various grades sold, the enormous profit goes nearly all into e pockets of middlemen, and the producers see only a fraction hich, year by year, is growing less. How is this to be met and medied? The first thought and answer is,—by the formation of a werful Syndicate of planters and their friends to establish a Direct Supply Tea Association" and compete with the big tea stributing houses on their own ground. This, we are assured, has been thought of by Ceylon men settled in the Metropolis with the command of capital and experience in business; but after full consideration, they have shrunk back from an enterprise which they declare would be attended with immense difficulty and risk and might eventuate, through failure, in doing more harm than good to the producer. This is a first decision and we do not accept it as final, if the evil complained of continues as bad as at present. But, there is a simpler, preliminary mode of proceeding open to the Ceylon planter and his friends at this time which ought to be tried. It is well known that teas, advertised as the finest and retailed as high as 2*s.* and more per lb. by the big houses, are bought in the Lane at not more than 8*d.* per lb. We can imagine what the medium teas must be like if these are the finest sold in this way, and how the public taste is being gradually lowered. Now, it is suggested that the 1,600 planters now in Ceylon should once more send home good superior samples, half-chests or chests, to their relatives and friends with instructions that they are to demand and require of their grocers a better class of tea, a tea up to the sample produced which can be got for such and such a price. In many cases where there is opportunity, leisure, and inclination, this may, of course, lead to a little "direct trading," and every little helps. But, in any case, the simultaneous demand all over the United Kingdom for a better class of tea than that now sold at 1*s.* 6*d.* and 2*s.*, and the demonstration to grocers that a far superior tea *can* be laid down in his store, with an ample profit to himself, for that money, could not fail to work a change; to cause a fluttering at headquarters among distributiug houses and a re-arrangement and improvement in their grades of tea sold—all of which must tend, to some extent, to benefit the producer by giving a better price for his tea. It depends on the planters themselves then for the crusade to begin.

THE INDIAN TEA ASSOCIATION (LONDON).

THE following are extracts from the Annual Report laid before the Meeting on 26th July, 1898:—

NEW MARKETS.

Mr. Blechynden's Work in Amsrica.—This important work continued to receive the attention of the Committee during the whole of the year. The two Commissioners—Mr. Blechynden for India and Mr. Mackenzie for Ceylon—have continued to work together satisfactorily with no inconsiderable measure of success in making British-grown teas known to the American consumers. The various modes of advertisement have been detailed in previous reports, and these were combined with subsidies to persons and firms who interested themselves strongly in the movement. It may be safely said that facilities for obtaining British-grown teas are now offered in nearly every important district in New York, Brooklyn, Boston, etc. The number of firms dealing with Indian tea has largely increased, and of these firms nine out of every ten store our teas and offer them for sale to consumers. Efforts are being made in many quarters to take advantage of the trade in green tea, which is the predominant tea in the United States, by mixing with it a proportion of Indian and Ceylon growths, and in this direction an increasing consumption is looked for.

In response to the appeal made in Calcutta, subscriptions amounting to Rs.1,02,039 were received in 1897, as compared with Rs.1,03,674 in 1896 and Rs.90,575 in 1895, and in addition the sum of £200 was subscribed in London.

The planters of Southern India again contributed liberally.

The Committee issued on 15th of February an interim report on the operations in America. As will be seen from the interim report, the Committee, in view of the increased crops expected yearly both from India and Ceylon, recommended a fresh levy to enable them to continue their special work in America; This recommendation has been supported by the General Committee of the Indian Tea Association, Calcutta, and it is hoped that subscriptions will not fall short of those of last year.

The Tea Tax in the United States.—The imposition of a duty of 10 cents per pound as a war tax is unfortunately likely to curtail considerably the consumption of tea in the States, as it will add appreciably to its cost and tend to make coffee the more popular beverage. It is hoped, however, that the tax will be only a temporary one.

Our advertisements now point out that, owing to the strength and purity of our teas, buyers will not feel the tax so much as those who drink the weaker Japan and China tea.

Other New Markets.—In view of the increased production expected from the large area of new extensions to come into bearing, the Committee recognise the importance of giving attention to other markets besides that of America, especially to that of Russia, and will, at the first opportunity, appropriate a portion of the funds at their disposal towards that object.

Regulation of Sales.—Having been in communication with the Tea Brokers' Association on the subject of the excessive quantities of tea offered for sale on Mondays, and after consulting members on the subject at the end of March last, the following regulations were made:—

"1.—That Indian tea sales be held on Mondays and Thursdays during eight months of the year, and on Mondays only from the first Monday in April until the last Monday in July.

"2.—That the quantity limit for Mondays be from 25,000 to 30,000 packages, regulated so as not to require the sale to be continued later than 4 P.M.

"3.—Any surplus unsold from Monday's sale shall be offered on Wednesday. No catalogues to be printed for Wednesday.

"4.—Small breaks, appertaining to the tea offered, to be sold at the close of each day's sale."

TEA CROP.

The first estimate of the crop for last year was 156½ millions. The actual crop gathered was only 148 millions, climatic conditions having been unfavourable for yield and quality. The actual quantity shipped to the United Kingdom was 134 millions.

For the current season the total crop is estimated at 158¾ millions, of which 140½ millions will, it is estimated, be available for the United Kingdom. Unseasonable weather, however, in Cachar and Sylhet, experienced since the above estimates were framed, will considerably reduce the crop.

Travancore is not included in the above estimate, and about three million lbs. may be expected from that district, making a gross total of 161¾ million lbs.

TEA STATISTICS.

Countries outside the United Kingdom took nearly 9,000,000lbs. more Indian and Ceylon Tea in 1897 than in 1896. Progress in these external markets has been not only steady but rapid, viz.:—

Indian, 1893, 14,027,129; 1894, 14,149,904; 1895, 16,815,323; 1896, 19,206,172; 1897, 22,198,810.

Ceylon, 1893, 13,138,544; 1894, 14,563,082; 1895, 19,923,803; 1896, 23,465,733; 1897, 28,949,314.

Total lb., 1893, 27,165,673; 1894, 28,712,986; 1895, 36,739,126; 1896, 42,671,905; 1897, 51,148,124.

Stocks of Indian tea in London on 31st of May were:—

1896	1897	1898
26,750,610lb.	32,235,212lb.	38,213,368lb.

It is satisfactory to note that notwithstanding the increased production of Indian and Ceylon tea, the total stock of all tea in the United Kingdom was less on 31st of May than at the same time last year.

1896	1897	1898
69,601,000lb.	70,213,000lb.	66,915,000lb.

THE CURRENCY COMMITTEE.

STATEMENT OF THE INDIAN TEA ASSOCIATION.

THE following printed letter was sent to the Rt. Hon. Sir Henry Fowler, M.P., President of the Indian Currency Committee, on 24th June, 1898, by Mr. Ernest Tye, Secretary of the Indian Tea Association:—

SIR,—This Association, representing the producers of tea in India, is deeply interested to the solution of the questions now under the consideration of the Committee over which you preside, and I am directed to submit the following statement with reference to the action taken by the Government of India in closing the mints to the free coinage of silver and raising the exchange value of the rupee to about 1*s.* 4*d.*, and the effect of the same on the industry:—

(1) The Indian tea industry first began to be of importance about 35 years ago, when the crop of tea amounted to about 3,000,000lb. The crop of the past season was 151,000,000lb.

(2) This great industry, which was built up by the ent of our countrymen, and now represents a capital of over £20,0 has been the means of reclaiming large tracts of waste land Valleys of the Brahmapootra and Surma and other districts in and besides giving employment to several hundred European as Volunteers, form a valuable addition to the defensive resou the country, it provides for over 1,000,000 natives of India, whom come from congested districts and have greatly benefi the extension of tea cultivation.

(3) The capital invested in tea property in India is largel by persons in the United Kingdom, who were encouraged up an industry initiated by the Government of India, and since been attracted by the comparative safety of an investme staple article of consumption, which has hitherto given the returns on their money.

(4) The consumption of British-grown tea (Indian and C in this country last year amounted to 215,000,000lb., or near per head of the population, and the United Kingdom deriv large revenue of more than £3,500,000 from the heavy import representing over 40 per cent. of its value levied on the articl

(5) The action taken by the Government of India in its end to give an artificial value to the rupee as compared with the p value of its weight in silver places the growers of tea (as w other producers) in India at a disadvantage in their comp with their rivals in other silver-using countries to the ext exchange be maintained at 1*s.* 4*d.*, of the equivalent of an duty of over 30 per cent.

(6) Tea cultivation involves a large expenditure of c extending over several years, before the plant arrives at ma and if it ceased to be remunerative, the land, being generally un for any other crop, would relapse into jungle, and the money in it would be lost.

(7) The effect of the present currency policy on th industry of India is already seen in diminished profits, as sho the published accounts of various tea companies, and every added artificially to the value of the rupee will reduce the pro the industry this year by £250,000. The distrust which has created is also putting a stop to the further extension of tea vation in India, and will, it is feared, divert capital from In China, for the purpose of developing the tea industry of the country, under European supervision, and with modern metho cultivation and manufacture. The future of Indian and Ceylon will depend largely on their increased consumption in cou outside the United Kingdom, and the burden placed on them b artificial value given to the rupee will put them at a seriou advantage in competition with China tea. Without entering a lengthened criticism of the currency policy of the Goverr of India, I am to point out that the closure of the mints to th coinage of silver has not established that fixity of exchange was the avowed main reason for the adoption of the measur provided for the Government the supply of gold required to r the introduction of an effective gold standard practicable although the exchange value of the rupee has been raised higher level, thereby reducing the loss by exchange on the S tary of State's drafts, this saving has been obtained at the c producers in India, while the stringency produced in the r market imposes a heavy burden on trade, and threatens, i longed, to have disastrous effects on the industries of the cou The further proposals of the Government of India, as set fo their despatch, dated 3rd March, 1898, are framed so as to inc the stringency referred to, with the object of compellin exchange of gold for rupees at the rate of 1*s.* 4*d.* per rupee, or hi This is an attempt on the part of the Government to obtain below its value in silver at the expense of producers in India, the certainity of heavy, and possibly ruinous, loss to industries which India has to depend for the maintenance of the favou balance of trade required to enable it to meet its foreign indebt

I am desired to say that all, or any, of the following gentl who are members of the Association and have had exte experience in connection with the Indian Tea Trade, will be pre to attend as witnesses before the Committee whenever evidence can be taken:—Mr. D. Cruickshank, Mr. R. B. M Mr. J. N. Stuart, and Mr. W. H. Verner.

PRINTING—All kinds of Estate Weekly and Monthly Report and Account Forms, executed at our KARAPARUMBA PRESS.

MANURES.

sh Guano. Steamed Bone Meal. Poonacs:—Castor, Mowra, Hoongay. **Saltpetre, Crude and Refined** (Nitrate of Potash.)
ate of Soda. Sulphate of Ammonia. Sulphate of Potash. Muriate of Potash. Superphosphates. Phosphate Powder. Kainits Salts.
Mixtures can be made in any proportion without extra charge. **Packing** can be done to suit transport by bullocks, etc.
Prices will be furnished on application for delivery either at our Karaparumba Works, Calicut, the Calicut Railway Station, Palghat, Mettapollium, , or at our godowns in Cochin, Tellicherry, Mangalore and other places.
Quotations will be obtained and orders booked for any Manures not kept in stock. F.r.m.

5

THE following verses are taken from the *Times of Ceylon*:—

A SONG OF QUEEN TEA.

("And still they come."—*Ancient Legend.*)

A song of Queen Tea, I'll sing—
King Coffee, alas! is dead—
A song of the jungles ablaze in the spring
With yellow and green and red:
The ring of the native axe,
The crash of the falling tree,
The blaze of the fire that crackles and cracks,
The shriek of the Sinhalee:
The crackle, the blaze and the roar,
The smoke-columns rolling high,
That blot out the heavens behind and before
And redden the sun in the sky;
The black of the burnt hill-side,
The ridge of the hill like a comb,
The chaos of timber awry and astride—
Here is the planter's home!

Now see how the roads and the drains
Show yellow against the black!
'Tis thus that he bridles the 'monsoon rain's'
South-West and North-East attack.
Now the land is cut up into squares
With lining and holing and pegs;
For this is the manner the planter prepares
To plant—sure as 'eggs is eggs.'
The nurseries waving green,
The rains come down with a plump—
The weeds spring up; where on earth have they been
All the while?—and in goes the stump.
Then down comes the white-weed and fern,
The illuk and prickly spine,
But nevertheless they return and return
Nine hundred and ninety times nine?

Then, sudden, a bungalow springs—
The outcome of innocent plan—
In place of that Palace of Pioneer-kings
Of wattle a daub and cadjans,
A bungalow glittering white,
And roofed with the red of new tiles,
From here sees the planter to left and to right
Broad fields of deep green—and he smiles.
He smiles for the trials that were,
For the prospect of fortune to be,
For the land he has opened and made to bear—
At the black girls plucking the tea.
He smiles for the work he has wrought,
For the knows he has little to fear:—
Oh, the slow-coach folks 'at home' know naught
Of the pride of the pioneer!

You slow-coach folks 'at home,'
You folks of the 'auld countree,'
Now shut up your houses and cross the foam—
Who think you are wiser than we.
Do you know how your tea is grown?
Do you know how it's withered and rolled?
'No matter,' say you, 'though we've not been shown;
We *well* know how it has *sold*!'—
Go, buy in the London mart,
Then fill up your mouths with our tea,
You know that the prices are down—my heart!
Do you know that better than we?—
Then give us a cheer, say I,
And lend us a helping hand;
For there's very much more than meets the eye
In this beautiful spice-blown land.

What happens when Tea goes 'down'?
First, good men go to the wall;
Where once was a smile, there's now a frown—
There's not enough work for all.
The candle's then burnt at both ends,
And—*a man knows chum from chum.*
Do you want to know how to help us, friends?
Just *stop those 'creepers' that come!*
Those fine young dudes you send
Get taken and taught *for their cash.*
No wonder your favourite 'Singhalese Blend'
Turns into the inferior trash!

W. Prices on application.

You like your tea? That's well!
Then look to this spice-blown land;
And ere the profession goes 'slick to hell,'
Just—show us a helping hand.

So much for my song of Queen Tea;
I've sung her for all I'm worth.
It mayn't be much, but I've entered a plea
For her life, not her death from her birth.
There's many a man just now
Who wants every cent he's got;
Though a planter's hand ought to be at the plough
And not in his pockets, I wot!—
Come out, then, and have a look round,
For it's truth I've sung, not lies;
And you'll see for yourselves that the plaint is sound,
If you'll only just use your eyes.
I've done; but I reckon there are some
Have better cards yet in their hand;
But *if you stop those creepers that come*
You'll have shown us a helping hand.

ELTIJE.

INDIAN MARKETS FOR TEA.

HE question of opening up markets for the commoner classes of s is one which several directors of home companies have called ention to, and which a few years ago engaged the minds of a large nber of the Calcutta agency houses, and resulted in a feeble empt at some action. The outcome of the then scare was the ting of a company, entitled the Indian Supply Co., Ld, with a ital of Rs.1,00,000. It was intended that the capital of the com- y should be three lakhs, but the apathy of the interested public s so great that only a lakh or so could be raised; and judging m the last report published by this company, we cannot say either t much success has attended it, or that much enterprise has been played in carrying out the purpose for which it had been intended; fact, the greatest apathy seems to have been displayed by its nts, and every year some excuse made for frittering away the all capital of the company. It is now ten years since the Indian pply Tea Co. was started, and the capital has decreased very rly 50 per cent. With a capital reduced to Rs.60,000, the s has been during last year Rs.3,000 and outstandings written as bad Rs.1,662-5-6. A pretty balance sheet, is it not? As excuse for this disgraceful conduct of a public company, the ine and its consequent distress are pleaded. What famine have had to do with the tea-drinking public of India is a thing ond us, as one would naturally think that it did not reach so far he class who drink tea; and we would ask what is the necessity keeping a large stock of tea when there are weekly auctions where quantity could be obtained? The object of a company is to mote the drinking of our common teas among what might be med the middle classes of India, and it is surely badly served by ing up a quantity of common tea, holding it for a time, and then ting it again on the public market when it has deteriorated. We uld like to know what right any company of this kind has to d a stock of common tea that in one transaction results in a loss Rs.3,000 by resale. We would have been better pleased to know nething of how the teas were being pushed, and think the Rs.3,000 ght well have been spent in appointing a traveller to go about l sell the teas, whose remuneration should have been partly by and partly by commission. There are an immense number of ropeans of other industries outside tea who would be only too d to get a half chest of good sound drinking tea at, say, eight nas per lb., and for this class catering should be included in the ogramme, in addition to pushing the common teas. There are ndreds of other ways in which consumption of common teas might fostered. Why not engage the services of all the butlers on ard the hundreds of inland craft that ply on these waters? If se men were paid a liberal commission, look at the dissemination thousands of packets, by means of the travellers, on these steamers. r few, if any, would leave the steamers (after having tasted a cup tea) satisfied, unless they carried a packet away to show their *zilog* on their return to their native heath. That there is a big ld for enterprise no one doubts, but there must be energy displayed, l not the style of *laissez faire* that at present characterises this dertaking, unless all the shareholders wish to see their lakh of pees melt in the air.—*The Capital.*

SERDANG* AND THE LIBERIAN COFFEE ENTERPRISE.

(*By a Ceylon Planting Visitor.*)

THE description of the soil and rainfall sent to me some time back by the managing partner of one of the plantations there had given me a high idea of the country; but the reality I found far beyond anything told me.

The plantations I visited are situated at about 55 miles from Belawan, the shipping place, 40 of which are covered by rail to Lobocq Pakam, and the extension of it is being considered and will soon impose itself.

I must not forget, however, to mention *Keboen coffee*, the first plantation I saw on the main road at about seven miles from the rail and where the oldest trees exist. These I did not see, but a field of eight years old, bordering the cart road, was very luxuriant: topped at 8ft. they were touching at 10ft., without vacancies, under the shade of young cotton trees (kapok), which I would not recommend. Some young Arabica did not seem so promising owing, I think, to the too retentive flat drained land.

On Begerpang, the largest plantation of Serdang, with 300,000 trees planted within the $2\frac{1}{2}$ last years, the growth is all what can be desired; for even on the St. Paul's river (Monrovia), in the best cultivated gardens, I have not seen better. It is bearing heavily from after the second year (which *does not* seem to injure the trees later on).

In other plantations I have seen fields of trees up to four years, which all came up to the highest standard.

Hemeleia vastatrix is not unknown, but does not affect the trees in any way, on which it is but sparse.

GREEN BUG also is there, but only on trees from one to two and-a-half years old. It then seems to cease reproduction.†

The distance adopted is 10 by 10, which is fully necessary, and I am convinced that the returns at four years will be from 10 to 12 cwt. per acre (about 3lb. per tree).

A few cacao trees raised from seed obtained from Peradeniya (a forestero variety) planted on the edge of a ridge and uncared for had given an average of 40 pods at $3\frac{1}{2}$ years.

The altitude of the Serdang plantations is about 300ft., and the *rainfall* averages 100 inches, well distributed through the year. There is a heavy dew at night, clothes in the bungalow felt damp in the morning. The temperature is the same as in Ceylon at the same elevation, but the nights are cooler. Cyclones are unknown. There is less *fever* than in the Ceylon lowcountry, and living is cheap and comfortable.

The lay of land is generally undulating at such a gradient that roads have seldom to be diverted from the straight line, *high forest* covers the main part of it, with much good timber, and *lalang* (illuck grass) those parts which have been cultivated by the natives and being burned yearly, forest growth is prevented.

THE SOIL in the forest is a thick layer of humus covering a silicious brown loam of great depth. Thousands of square miles are in the same condition between the sea and the dividing range on the N. E. coast. I have seen nowhere in Ceylon anything to compare to that part of Sumatra as to general conditions required for lowcountry products, and Dutch and German planters have assured me that the S. E. part (Palembang) and the Padeng west coast is even more fertile.

Deli and Serdang might well be called the stoneless country; the ballast for the railway has to be imported from Penang, and there is no gravel for the roads. The land in Sumatra is leased for 75 years. In Serdang the Sultan requires at present $8 per bouw ($1\frac{3}{4}$ acres) and a yearly rent of $1; besides the Government survey costs 1, 10 gulden per bouw.

THE JAVANESE LABOUR is unlimited, and the cost is cheaper in the end than our decayed Tamil labour. It is indented for three years. A premium of 30 guldens (1 gulden = 1*s.* 8 1-3*d.*) free passage 10 g. advance 30 g. Monthly wages, men $6 ($1 = 1*s.* $11\frac{1}{2}d.$), women $3:

* A Dutch protected State of N.-W. Sumatra.

† This would be in favour of my theory that another mysterious (*root*) disease was in Ceylon in conjunction with these two and was the main cause of the destruction of the coffee. A root disease also affected the cacao for several years (1884-91), and was the reason of the abandonment of one-third of the acreage then in cultivation.

work 6 to 11-30 A.M. and 1 to 6 P.M. Only two free days per month, periods of sickness deducted, no kanganies, mandares or overseers appointed by the manager. No crimping nor bolting possible by good regulations.

THE FELLING AND CLEARING is generally done by Battaks, the aborigines of the country, and cost $10 per acre. They also contract for the *buildings*, such as sheds and lines at a more moderate cost than in Ceylon.

A certain amount of Tamils (called Klings there) are also employed, more specially as cartmen.

The Malays have many privileges, and only few of them care to serve as house servants. They have their own lands that they cultivate, but nowhere have I seen a wet paddy field. They have groves of nutmeg trees; but the produce is all consumed in the country, for no export is reported, so are the cocoanuts and the arecanuts, the former being sold at $5 per 1,000. Nearly all the rice is imported from Singapore or Penang, being raw rice from Siam and Burma.

The Chinese work on the tobacco estates, where their more skilled labour is more remunerated or have holdings of their own, particularly in the tobacco country where they produce large quantities of sweet potatoes, manioca, beans and vegetables. They do nearly all the trade of supplies, none being given to the coolies by the managers of plantations. Nearly all the artisans belong to that race.

The universal language is Malay.

The interior of Sumatra is practically unknown. Exploration requires the special permission of the Resident on account of the danger. It is inhabited by the Battaks, a warlike race of good physique. They have no racial connection with the Malays, who came over from the Straits some centuries ago and repulsed them. Their features have much affinity with those of the Tamils, but of a paler hue, probably due to the more cloudy sky. They have their own writing and make their own weapons; but, nevertheless, are cannibals. One of them working on the plantations admitted in my presence having eaten human flesh. They cultivate dry paddy and other grains, sweet potatoes, manioca, tobacco, etc. They are very jealous of their females. I was told that they were not fetiches, but could obtain no details as to their religions.

THE PRUNING OF TEA.

SOME SUGGESTIONS FOR AN IMPROVED SYSTEM.

(By a Planter in India of Twenty-four Years' Experience.)

AFTER a long experience I venture to give some of my ideas about pruning. I want to show that *cutting down* is a serious mistake, and to propose a system by which this cruel operation can be stopped entirely. If any one will take the trouble to examine a bush which is about to be sacrificed, he will see by marks and signs that the great stems are of various ages. Some of the branches will show the scar of a previous cutting low down near the ground, other branches will be found with a clean stem almost level with the top of the bush, and the marks of the annual prunings will be found at intervals on all the stems. This will prove that some of the branches grew up from the ground or out of the old branches after the last cutting down. The theory which I have evolved from this fact is that branches should be eradicated only when they cease to yield well and that the bush *will* constantly renew itself with fresh vigorous branches.

I have for many years been working patiently to brin garden in my charge into good growth, and I have succeeded, am confident that I can now keep my bushes at a constant lev in full vigorous growth, without "cutting down" a single bus in course of time I expect to get all the bushes to be one heigh of equal bearing surface. During the last four years I hav ceeded in getting the height and surface more uniform, but w began I had bushes of all sizes; the biggest are three feet up pruning point, and I refuse to cut down even these which are too high.

At each pruning I cut off the new wood close to the last pruni any bush over two feet in height, leaving only about one inch o wood; on the lower bushes I leave from four to eight inches of new so that in course of time the smaller bushes will reach the hei the best. In course of time I shall reduce the height of the b which are too high. Any new wood found growing from low is cut at about two feet from the ground, and one or two tallest branches are cut out, the weakest being selected for sac I am not sure that three feet is too high, because I find bus this height have new wood as thick as one's thumb, and by th of the season they have grown to about 4½ feet, which is well reach of the pluckers. If my system can be adopted, the after eight or ten years would be that each bush would be com of straight clean branches without a break, to the height of tw and above that there would be visible the scars of each succ pruning. And then year by year the weakest of these would down as low as possible, and replaced by new wood from belo

I have been applying this system thoroughly only for four and I notice that most of the bushes have one to three of thes clean stems; and the older branches show good growth ow judicious topping off of weaker parts. And when I find that branch has sent out good new wood from low down, and the t ceased to give strong new growth, I cut off the piece above th wood. Only four years have shown such a vast improvemen I am now confident of being able to renew each bush in course of

I recognise that there is a short cut to this result, *i.e.*, to cut and re-grow the bushes, but I should have to sacrifice a grea of tea, and I consider it wiser to sacrifice the appearance bushes to keep up yield of tea, than to sacrifice the yield to ge bushes. "Cutting down" is a short cut, and as usual with cuts it proves to be the longest way round. The object of c down is eventually to increase the yield, and no nooner has this been attained than it becomes necessary to resort to it. But that by a system of constantly cutting out *only* those bra which show weakness, the bushes can be kept at one constant and surface, and will give the same yield from year to year wi any limit of time. It is also reasonable to think that branches clean from the ground to the pruning point will have a freer f sap than those which have been cut and hacked at yearly int One must have at least two feet growth to give a large surfa bush, and if you can get the sap to flow *straight* up to this ne height the result must be increased yield. It is necessary t out the bushes now and then, and I think that intervals of tw are quite sufficient. Thus one half of a garden would be clean thoroughly, all whippy and undersized wood cut off, and the half of the garden should be light pruned, and all the *inside* g left alone, and only the surface growth should be cut off.

This light pruned part would begin to yield first, and woul a considerable amount of leaf before the other part can be pl The *surface* only of each bush should be plucked, so that an shoots which grow from inside are not touched until they app the surface. These will give new straight wood to prune on end of the year. At first I had to do my pruning with two coolies; the ordinary lot simply pruned the bush leaving the re amount of new growth.

After them came the knowing lot who selected hard woo cut out. My work was to examine this cut out hard wood that no vigorous parts were cut away. If I found a knot with wood on it, say about ¼ inch diameter, I explained to the man had lost the yield of that piece of wood for a whole year, and wanted only weak wood to be cut off. This required a great d attention. Now I make the men collect what they cut off an up the bits at intervals and I examine those heaps. But ev ordinary coolies are getting to know what I want, and as onl the garden has to be pruned with discretion, there is not muc of serious over-pruning. The rest of the garden is only "cut

"PLANTING OPINION" OFFICE,
Nos. 11 and 12, 2nd Line Beach, Madras.

t quite straight, but with a view to giving as regular a surface as ssible. I like to see the bushes "round," it gives more surface, d the side branches can be of the same length as the centre ones. ıave seen a piece of old tea yielding well which had never been cut wn,—it averaged about three feet to the pruning point; and regarding e fear that a bush will get too high this can be obviated by not ıving too much growth at each pruning. If you start pruning a w shoot at two feet, and leave only one inch each year, this shoot will ly be three feet in height in twelve years; and supposing that by that ne it shows signs of getting weak, you can cut it out entirely, and place will be taken by other shoots which have grown up in the terval.

With a new extension, and this system of pruning, I imagine that e greatest yield would be attained over the course of any given ımber of years. No branch should be cut below two feet, and I ally think that with a good class of plant three feet would be the best ight. A bush of this sort would not grow much brush-wood inside. ıiling a ready made garden which has not been hacked and hewed, is possible with patience and discretion to get the place round adually. Rather than cut down a gnarled bush, I would leave it ıpruned for two years; it has not sufficient energy to grow fine w wood in one year, but at the end of two years some of the rowth would be found of a decent size. With a little humouring is bush will begin to send out good wood from lower down, and it ill in time regain vigour and youth, whereas one or two "cuttings wn" will leave it an old wreck with only a few twigs to show that is alive. I think that as a rule tea is "cut down" not because it s fallen off in yield, but from the fear that it will soon begin to eld less, and that the bushes will get too high. I would earnestly commend to any one who contemplates the renewal of a plot of a by cutting down to give it a year or two more of full growth, inning out some of the worst branches, keeping a careful record of e yield as compared with past seasons. This advice would apply pecially to any manager taking charge of a new garden, which ccording to his opinion) has been ruined by past bad pruning, or verplucking. As long as a branch can give new wood as thick one's little finger there is no fear of its power of yielding ell; then why should thousands of such branches be cut down? And nsider the loss of plucking surface. As an illustration, take a mpass and draw concentric semicircles on a straight line, have one 1 inch radius, another of 2 inches, another of 3, and another of 4. his last semicircle of 4 feet represents the bush which has to be ıt down, and the intermediate lines will show the gradual increase the original surface, and I am quite convinced that the greatest ssible surface (*i.e.*, all the bushes touching) can be maintained by mply cutting out weak branches, and pruning any new growth at ıe level of the surface of the bush.

I must admit that I have never seen a whole garden pruned on ıis system from the very beginning, so that I must also admit that ıe universal practice is opposed to my theory, and it is always rash suggest that the universal practice is wrong. However, I venture do so because I have worked hard at the problem for six years on n old and much hacked estate, and at the end of this time, of which nly four years have been *fully* given to the idea, I can see a very reat improvement in the appearance of the bushes, and I have also he *proof* of the benefit to the bushes, because I make *more* tea of ery much better quality than my predecessors made in former imes.

If any one has had experience that this system is not the best, I hould like to hear from him. I imagine that this system would ive best results in Ceylon, the bushes being pruned every second ear; one quarter of the estate cleaned out and pruned thoroughly, ne quarter pruned lightly, and one-half not touched at all. The wo years of growth gives the new wood time to be well matured efore it is cut, and any wood that has not grown to a standard size an be shaved off close to the branch it started from.

This pruning at intervals of two and three years is customary in eylon. I have little doubt that it would be best for India also, but he annual pruning has become so firmly fixed that I do not dare to uggest any departure. I can only say that I tried the plan on a patch f Manipuri indigenous, and it gave 14 maunds of tea per acre, gainst a yield of 12 maunds from the rest of the plot which was runed as usual.

That was long ago, and I had not sufficient courage or power to ontinue the experiment on a large scale. I have nothing to say to hose who are in charge of estates on good soil and yielding more leaf than their labour forces can handle, but there are many properties which might be saved by patient and careful fostering of the bushes, and by refraining from the established custom of cutting down. The planter has an instinctive horror of a "*knot*," and to get rid of the knot, he gets rid of the bush. There is also an idea that the tea plant has not the power to propel the sap to a distance beyond two feet or so. Naturally, when the old stem is interrupted at intervals of a few inches, and is also tapped by small side growth, the sap does not show great vigour; but a stem which rises clear from the ground up to the yielding part and having no small branches to divide the sap will show great strength and give a good crop of strong well-grown leaf. Whether straight or gnarled the life of a branch comes to an end sooner, or later, but it is folly to cut it out before it has given signs of weakness. One should have a standard gauge of wood below which the branch should come out, and each branch should be left as long as it grows wood of the standard girth. On some soils planted with indigenous, half inch diameter might be taken as a gauge; on other soils with hybrid plant quarter inch might be the limit.

My principles now are not to sacrifice one inch of yielding surface area, and to increase the surface year by year by adding about four inches growth at each pruning to the smaller bushes; to carefully cut away poor wood so as to give more sap to the branches which are yielding well.

Beyond this, at present I have not sufficient labour to take all the leaf that is grown, so that manuring or anything of the sort is not advisable. Having mentioned the word manure, I cannot refrain from repeating what I said once before that manuring should be adopted, *not* to improve the bushes, but as a separate means of utilising capital to good profit. In course of time, I expect that manuring will become general, and that it will be found an excellent source of revenue. You will pour money on the roots of the plants, and take it off the tops with an increase of about 10 per cent. With very ordinary care, one thousand rupees applied as manure to a given plot of land *annually* should give a return of eleven hundred rupees, that is to say, 10 per cent. At this rate a big company would find it more profitable to spend R50,000, getting a return of R55,000 per annum, than in spending an equivalent sum in extending its area of plant.

With pruning on the system detailed above, and liberal manuring every year, the yield of a whole estate should not stop short of 1,600lb. of tea per acre. And this would be better in every way than having an estate of double the area yielding 800lb. per acre.—*Tropical Agriculturist.*

ROUND THE BUNGALOW.

THE want of a sufficient quantity of vegetables is frequently felt by those who do not possess a kitchen garden. Considering the important part vegetables take as health-producers, it is surprising that planters ever allow themselves to go without this necessary adjunct to their bungalows. To those dependent on their supply from the weekly market, a good way of keeping them fresh is here given. Even vegetables, such as cabbages, lettuce, &c., should be kept on a damp shelf and covered with a cloth wrung out in coldest water procurable. Carrots and all root crops are best kept on a layer of fine sand; do not attempt to wash these till required for use. Potatoes often get rotten and mouldy for being packed away in a tin box. This most necessary tuber should be put away on dry sand, first taking special care to see that they are thoroughly dry. An occasional sunning will keep them good for months.

Salads of cold meat, fish and eggs are generally appreciated by most people, and I have copied a few from different sources which I have tried and have been generally approved.

Fish salad. Take a tin of any fish selected. Have a couple of cos lettuce well washed and wipe dry, *tear* the leaves lengthwise, add a small quantity of tarragon vinegar, a little pepper and salt, six or eight tablespoonfuls of pure salad oil, and two of vinegar, and if procurable a small cucumber sliced fine or tomatoes. Arrange according to taste.

Waldorf salad. Waldorf salad is made from apples and celery. Use mayonnaise dressing, into which you have stirred whipped cream. Pare the apples and chop them rather fine; cut the celery, mix the two together, and sprinkle over a little lemon juice, salt and pepper. Make the mayonnaise exceedingly stiff; just

before mixing it with the apples and celery, stir into it sufficient whipped cream to make it light in colour, but not enough to spoil its consistency; add a few drops of green colouring; mix the whole together, and serve on lettuce leaves.

Forced eggs. Pound and pass through a hair sieve the flesh of three large anchovies, freed from the bones and the skin. Boil six fresh eggs for ten minutes, and when they are perfectly cold, halve them lengthwise, take out the yolk, pound to a paste, with some fresh butter; then add the anchovies, a little mace, and as much cayenne as will season the mixture well. Beat these together thoroughly and fill the whites neatly with them. Serve with mayonnaise and lettuce.

NOW UP AND NOW DOWN.

NOTICE the slender column of mercury in your thermometer. To-day it is longer than it was yesterday; to-morrow it may be longer still, or much shorter; you can't tell in advance. So it varies with the amount of heat in the atmosphere. Very good; but we all knew that before, you say.

Take note of another measuring instrument, then; one that you carry about whithersoever you go. We often hear one person say of another, "His spirits are very mercurial," meaning that they rise or fall under slight influences. But others have protracted periods of depression of spirits, sometimes threatening permanent melancholia. In fact, instances of this kind are getting to be alarmingly common, and any suggestions as to the cause and the remedy must be welcome to society at large.

Speaking of a recent illness of her own, Mrs. Hagar Percival says the doctor pronounced her ailment to be "nervous debility." The phrase is familiar and expressive, and the doctor used it in the ordinarily accepted sense. After all we seem to need more light. Perhaps we shall get it by turning a leaf backward and finding out how the trouble began.

"In July, 1889," says the lady, "I felt strangely weak and out of spirits. I could scarcely persuade myself to eat anything, and when I did the food caused me much distress in the stomach and pain in the chest. Neither did I get any strength from it, but grew more weak and nervous. Later on I had frequent attacks of dizziness and fainting fits, which would come upon me in the street, so that I often came near falling to the ground. Sometimes I had two or three such attacks in a single day. The doctor said I had nervous debility, but the medicine he gave me did no good.

"Better and worse I suffered in this manner for about three years, no treatment availing to relieve me. At Easter of 1892 my mother brought me a bottle of medicine of the same kind that had cured her of liver complaint. I began using it, and in a short time I could eat better, and my food digested without giving me any trouble or discomfort. I grew stronger, the fainting fits gradually ceased, and I regained my health. (Signed) Hagar Percival, 25, Lind Street, Country Road, Walton, Liverpool, July 19th, 1893."

In a letter, dated November 30th, 1892, and written at his home, 142, Shepherd's Bush Road, London, W., a correspondent states that in the year 1883 he fell into a condition of nervous debility. He took medicines in plenty, but grew worse and worse notwithstanding. The early peculiarities of his case were exactly the same as in the case of Mrs. Percival, above named.

"One day," he declares, "a friend of mine, Mr. Charles Swan, of King's Street, told me of a medicine from the use of which his sister had derived great benefit under like circumstances. I had once began taking it, and before I had finished one bottle the pain and distress left me, my nerves were steady, and I gained strength. After I had used three bottles I was in as good health as I was before the attack the previous spring. Appreciating the value of a remedy which proved able to do what no other could accomplish, I am perfectly willing to have the fact made public. (Signed) Frank William Deacon."

The nervous depression in both these cases, as in most others, was the direct consequence of the circulation of impurities of the blood. The extreme melancholy and distortion of judgment witnessed in hypochondriacs arises from the same cause; and (*this point is for your memory*) the cause underlying all, is indigestion and dyspepsia, which creates these impurities in the stomach and scatters them through the system.

To have strong nerves we must have pure blood; to have pure blood we must have perfect digestion, and to have *that* we must do what these two people did, use Mother Seigel's Curative S They used it as soon as they heard of it. Warned by their nee suffering, *you* will use it the moment you feel the first sympto the coming evil.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (*July* 29, 1898) sa Public sales were only held on Tuesday this week in consequence o August Bank holidays and will not be resumed till Thursday next, A 4th. Large supplies were brought forward, however, on Tuesday, b demand was slow, and values ruled generally easier.

Only 80 bags East India were offered and part sold at barely s prices.

Costa Rica, which formed the bulk of the catalogues, met very competition, and a large proportion was bought in, the rest selli easier rates.

A firm tone has prevailed in the Terme market on smaller Bra receipts, and quotations mark an advance of about 6d. in the week.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Marke the week ending July 27th, 1898, says :—Bank rate 2½%. Bombay Exch closes at 1s. 3 1/16d. Brazil Exchange 7 9/32d. Rupee paper 3½% Silver 27¼d. per oz.

A flat tone has prevailed in this market throughout the past business being on a very small scale. The moderate supplies o were only partly disposed of at somewhat easier rates. Public sales be suspended from next Thursday until the 4th August. Brazil Ma are very quiet.

Daily receipts averaged 8,000 bags in Rio, and 17,400 bags in Sant

Futures have shown more firmness, and closing prices are 3d. t per cwt. above our last, viz. :—Good average Santos in Havre, Septe delivery, fcs. 36.25, in Hamburg pf. 30¼, and No. 7 low ordinary R New York $5.50.

To-day's London official quotations are :—

	Sept.	Oct.	Dec., '98.	Mar.	May,
SANTOS ...	29/	29/6	29/9	30/3	30/

We quote :—

UBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, it Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including tage. Single Copies, Eight Annas.

DVERTISEMENTS.—From the 1st October, 1897, the charge for advertisements will be: 4 as. per line for the first, 3 as. for the second, 2 as. for the third and succeeding insertions. Five-line advertisements Subscribers will be inserted for three issues for one rupee; non-Subbers will be charged two rupees.

OMESTIC OCCURRENCE.—The fee for inserting a domestic rrence will be *One Rupee* for each insertion, payable in advance.

.B.—Remittances should be sent to the Manager, "Planting Opinion," 2, Second Line Beach, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been oved to Madras, all remittances should be made pays to the Manager of *Planting Opinion*, 11 and 12, ond Line Beach, Madras, who will also attend to all ertisements, &c.

Letters to the Editor should be addressed to Coonoor, usual.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 2nd September, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

THE INDIAN TEA ASSOCIATION.

The Assam Branch held its Annual Meeting on 16th July, the Indian Tea Association followed with its annual general meeting on 16th instant. Extracts from the reports are given elsewhere in this issue, and some points deserve special comment. For instance, it is of interest to note that the total planted area represented by the Association is 308,920¾ acres. That this shows an increase of 33,473¼ acres on the figures of the previous year, points to increased production. The Association levies an assessment at the rate of one anna per acre, amounting to Rs.19,307-8-9, thus providing itself with a handsome income. Then again, the report of the Assam Branch informs us that the report on tea culture for 1897 shows that the total number of coolies employed permanently is 442,608 and temporarily 35,602, showing a total of 478,210. In 1896 no less than 81,115 coolies of all classes were imported into Assam, not including those imported for the Assam-Bengal Railway. Figures such as these have a double interest; they prove the importance and power of the tea industry, but they also show of what great moment to tea-planters are all questions affecting their labour supply, a considerable portion of which is

imported from long distances. On this latter point the Hon. Mr. Buckingham, the Chairman of the Assam Branch, had a good deal to say. Planters in the North, like their brethren in the South, have had labour troubles. Government is considering some of these; and the planters are evidently a little doubtful whether the eventual action of Government will be altogether to their liking. Mr. Buckingham remarked: "I think we ought to be prepared for any radical changes in our Coolie Laws. From what I have been able to gather, we must be prepared for certain proposals which will not be, by any means, acceptable, such as the reduction of contracts from four years to three." He added that another question that would affect planters most materially was the raising of the rate of wages from five and four to six and five rupees a month. Finally, he made this remarkable statement:—"The protection we receive from the Act becomes less with each amendment, and doctoring of the above description will certainly drive it out of existence." The responsibility for this rests solely with the highest authorities, for Mr. Buckingham asserts that every Chief Commissioner of Assam has testified to the coolie being looked after and cared for. He is right in stating that emigration should, therefore, be encouraged by every possible means in the power of Government, and not checked by enactments and artificial difficulties which undoubtedly increase the expense of importing, and throw an immense amount of extra work on Government officials in Assam.

That South Indian planters will agree with Mr. Buckingham on the above points, goes without saying. They will also be interested to find the subject of a chemical expert for tea districts still under discussion. In the North, as in the South, there is the chance of the services of a really good man being lost in consequence of delay. Then again, remarks on the American Market Fund are worth noting. It is suggested that a tax should be raised *by Government* for distributing the cost of placing tea in other markets. Travancore contributes to the above fund, but we doubt if any other district in the South takes special steps towards the discovery of new markets, or the development of those already known. Yet Ceylon not only spends large arms in America; it has given £200 towards the introduction of tea to Russia, £200 to Belgium, 5,000lbs. of tea for Germany, and the Ceylon Government granted £500 for advertising tea in Russia. With new areas constantly being opened up, new markets must also be sought, or a reduction of prices will be inevitable. And this question of price should be watched very closely just now, lest faults be laid at the door of Currency that rightly belong to the planter himself. It is obviously useless for him to argue about Currency matters while neglecting his own interests in respect of over-production, or a want of energy to go into the subject of the development of consumption. Competition must necessarily increase, it will not slacken. The planter must gird up his loins for the struggle, and he who thinks to win through the intervention of Government as regards the Currency question will fail, while his brother who improves his crops, and at the same time helps to make markets for them, will come out a victor. However, it is not out of place to notice here that the General Committee in India of the Indian Tea Association adopted the following resolutions and cabled the substance thereof to the London Committee of 15th June, 1898:—(1) That a gold standard is not needed in India even if it be practicable to establish it. (2) Tha cost of establishing it with or without a gold curre prohibitive, and that an undue proportion of such cos fall upon tea-growers. (3) That therefore in the op of this Committee the Indian Currency Committee sh be directed to enquire into the question of how to re the mints to the free coinage of silver with the least i venience to the trade of the country.

We attach importance to the proceedings of the I Tea Association in regard to every detail. Some p have no direct interest to our readers in the South be the example they afford of the manner in which p *local* interests receive the attention of the Central As tion. Other matters are of great importance to al planters in India, and we trust that these will be spe studied, and that co-operation will be arranged whe possible. There are various subjects touched upon i report, to which we make no special allusion here, but remarks are extracted on another page. After cons ing the whole report and its indirect bearings on tea industry in Southern India, we find ourselves reve to the section—though in another branch, so to s that first attracted us. The Labour Question pervade whole report. Its gravity is felt more than it is expre but expression is so far given to it that itappears tha Indian Tea Association has now made a very long s towards the carrying out of its scheme for establishi Central Recruiting Association. A Board of Manage has been in existence for some months. It has held se meetings, and having devoted considerable time and a tion to the compilation of the Articles of Association Form of Agreement with relative schedules essenti the formal incorporation of the Association, it awaits the final reply of intending subscribers to scheme before beginning active operations. The r states that it is understood that a majority of the dis of Assam, Cachar and Sylhet, representing upward 84 per cent. of the cultivated area, are prepared to join give the Association a trial, in which case it is under that operations would commence as from the beginni season 1899. The progress of this movement wil carefully watched no doubt, and it is to be hoped great good will result from it. In many ways the I Tea Association is on a widely different foundation the U.P.A.S.I., but there are also many points of re blance. To some extent the two might co-operate than they have yet arranged to do. Meanwhile, probable that each could learn some useful lessons fro other.

THE WORLD'S COFFEE CROP.

THE State Department at Washington has issued a r upon the coffee crop of the world. Probably the figures therein may be safely accepted as approximately co but though the report is interesting, some of the deduc arrived at by the writer are amusing rather than ins tive. Mr. FRANK D. HILL, United States Cons Santiago, is responsible for the report, and the line he is revealed in one sentence, where he says, "as a rule a yield for several years is followed by a rapid falli each subsequent year up to the point of ceasing to yi This is rather a sweeping remark. It means nothing

r less than that when a coffee planter has had several od crops in succession, he had better think of selling his ate, for it will gradually cease to yield! The most ious fact is that Mr. HILL cites Ceylon as proving this. points out that in Ceylon the exportation rose to 892,454 gs in 1869-70, and declined rapidly year after year, ng now reduced to about 50,000 bags annually. Not a rd is said to indicate that there was any special or ceptional cause for this falling off. Noting this, and owing what that cause was, our readers will perhaps ach less weight than Mr. HILL does to the similar luctions of exports that have occurred in other countries as ll as Ceylon. He says that in Java, Padang, Macassar, ., where the product reached its height in 1883 787,342 bags), the production is now one-half that ount. In Central America a very sensible decline has in during the last three years, and it promises to become ll more accentuated. The same thing is observed in the ates of Rio de Janeiro, Minas Geraes, and Espirito Santo, Brazil, where the diminution has reached considerable ures in virtue of the abandonment of old trees. The portation from Rio de Janeiro rose to 4,209,200 bags 1884-85, from which time a decline has set in, until the op remains stationary, Mr. Lacerda putting it at about 50,000 bags annually. The exportation from Rio de neiro during the calendar year ended December 31st, 97, was 3,905,000 bags. If we were to carry these marks to a logical conclusion, we should understand that course of time all the above countries would cease to port coffee! We are told that the production of Bahia d Ceara has increased during late years; but the additional pply is not important. Are these ports near the zenith their course as coffee-exporters, and are we to look rward to their gradually ceasing such exports? We rcely think so; and even if it were so, we must bear mind that in many tracts coffee cultivation has not yet en tried, so there is room for fresh fields. The report fore us states that besides the amount shipped from ntos, the dock authorities at Rio de Janeiro, in their e returns, show that of the exportation for 1897, 300,000 gs were of Sao Paulo origin. This was due to exceptional ıses; the opening up of vast and hitherto, from a market int of view, inaccessible tracts, by the great extensions of ilway lines and the inflow of a great current of immigration. o to 1870, even in epochs of high prices, the profits sappeared when it cost, as in Venezuela, in some sections to $7 in United States gold per bag to get the produce market. To-day, while rates differ according to distance, nigh average freight charge would be 5 milreis per bag 132lb. This points towards a development of the ffee industry rather than towards its extinction; and it is arcely credible that if men are encouraged to work their tates because of a reduction of transit charges they will d those estates cease to yield as soon as they have given everal' good crops in succession.

A more cheering view is seen when we turn to remarks out consumption. It is remarked that while the increase production has been stupendous, the increase in con- mption has been quite as remarkable. The mean annual nsumption for the three decades ended with 1890 was:— 70, 6,000,000,000 bags; 1880, 10,000,000 bags; 1890, ,000,000,000 bags. As long ago as 1893 the *American rocer* estimated that the world required an annual supply of 11,050,000 to 11,220,000 bags, and these figures were further stated to be the minimum requirements. In the quarter of a century, from 1870 to 1895, the demands of the consuming markets had doubled. There is consolation in this; and if, indeed, coffee-estates gradually lose their fecundity while consumption goes on expanding rapidly, there is hope yet for the few planters who can manage to keep on sending supplies to market. If we could but share Mr. HILL's conclusions about the results of a succession of prolific seasons, we should be disposed to prophecy "High Prices" loudest at the very moment when rates stood at an abnormally low level!

NOTES.

Farming on the Nilgiris. *Indian Gardening* has commenced a series of articles on this subject written by one who tried it. These promise to be of considerable interest, and we would recommend our readers to peruse them carefully, as there is undoubtedly an opening for money-making by dealing in farm produce in the neighbourhood of the larger towns on the several hill ranges of this Presidency.

Lipton again. The following shows the push of Lipton, Ltd. It should be a good advertisement with the number of men employed and the consequent stream of spectators:—

"Lipton, Limited, has contracted with the War Office for the rations and entire catering of the wet and dry canteens of the Northern and Southern armies in connection with the forthcoming army manœuvres. Eighty thousand men are expected to be engaged on Salisbury Plain during August and September next."

Fever in Plants. Mr. H. M. Richards, in the "Annals of Botany," states that plants get fever, and the relative discomfort is greater than in animals. The onion is said to be very sensitive to fever, and gets very ill, indeed, if a leaf is broken off the bulb. The potato stands fever well; so does the radish. If hurt, they are only slightly affected. Fever in plants is accompanied by an increased rate of respiration and evolution of heat, as in other animals. The effect, therefore, of picking a flower, or tearing off a branch, would amount to cruelty to plants.

Saltpetre Refinery. Elsewhere we print a long communication from "Toda" regarding the proposed Co-operative Refinery. "Toda" criticizes our criticism at some length, but the conclusion arrived at is that, from our own criticism, we have proved that saltpetre can be turned out at Rs.50 a ton. We had no intention whatever of throwing cold water on the scheme, for we have often acknowledged the value of this alkali as a fertilizer, but we think that the whole scheme must be put on a thorough business basis before it will take a practical shape.

Orange Tree Seedlings. We learn from the *Bombay Natural History Society's Journey* that:—

"From published statements it appears that orange trees, for fruit-bearing purposes, are frequently raised from seed in America. In this country the usual practice is to sow the seeds of the citron

(*Jumburi*) and graft on to that stock, by the process termed 'budding,' the variety of orange selected. In 1881 I sowed seeds of the best Nagpore Cintra oranges, and one of the trees raised has given produce. The fruit of the seedling has more numerous seeds, a deeper colour of pulp, a stronger inner stem (endocarp), and a more abundant bitter in the skin. It is nearly equal in size with its parent, and some of the fruit is tight skinned, other specimens having loose skins. As a fruit tree, this seedling is decidedly inferior to its parent. For the purpose of obtaining improved varieties, it is desirable to raise trees from seed of superior oranges, and those which prove inferior may be grafted with approved kinds after the natural fruit has been produced."

Black Pepper. If we are to accept the figures of the *Planter* as conclusive, the cultivation of Black Pepper should be a most profitable acquisition to planters residing within the zone where pepper flourishes. That an acre will carry 500 betel trees, and each tree carrying a vine will produce 250 per acre, without any material cultivation, reads almost as a dream; and putting the betel supplied at 500 trees, say, at Rs.100 per acre,—we only put this forward as a surmise,—we have the enormous return of Rs.350 per acre—a figure, considering the very little attention and curing of crops, as beyond the happiest dreams of any planter,—either tea or coffee—at present existing and perspiring under an Indian sun. Whether there are blights or other enemies to the crop we are unaware, but the figures as they stand make us wish we could take up about 50 acres of pepper in a favourable locality, and exist.

The Wily Chetty and the Innocent Planter. The following, communicated to us by a correspondent, goes to prove that the "ways that are dark, and tricks that are vain," are not only the accomplishments of the "heathen Chinee," but may be found occasionally within the limits of this land of exile:—

I used to think I was as cute a young man as any to be found that I have rubbed shoulders with,—a smart Yankee, and not been worsted, and never yet was taken in by any sharper. I confess, however, to having been at last discomfited at the hands of an Indian bazaar man. The way of it was this. I am a planter in a rather out-of-the way district, though my isolation is compensated for by the suitableness of the place for the purpose I selected it, which was to grow tea on the upper portion of the land and coffee on the lower.

In course of time the firstfruits were gathered in, and I wanted to sell the strippings and tailings of my crop locally, and called in the native dealers to whom I offered them.

After the usual bargaining, I accepted the offer, Rs.4-8 per full bushel for 100 bushels; saw it measured and tied up in sacks, and made out the bill. It then occurred to me that the merchant might buy some of my tea. It was my first attempt at manufacture, and was not particularly good, as coolies were new to the work; so, rather than send it to Mincing Lane, to get a bad name for the estate, I resolved to sell it in the country also. The Chetty, however, would not buy both the tea and coffee, but agreed to take the tea if I would allow him to give back the coffee for it. I was very glad to accede to the proposal, as coffee is always more easy of sale than tea, so 12 annas per pound was arranged as the price. The coffee bags were, therefore, emptied; the bill amended, and the tea chests removed.

A week passed without payment being made; and as it was still delayed, it was necessary to use threats, and, at, last to file a suit against the man. In due course the case was heard; but imagine my surprise at the novelty of the defence set up. The man said he did not buy the tea, but gave coffee of equal value in exchange for it. After a careful hearing, the plea was sustained, and a decision was given in his favour. I protested against this view of the matter, but to no avail. I was told the case was as clear as noonday. I had sold, and the merchant had bought, coffee!!

Coffee Adulteration. In recent issues we have rep edly drawn attention to the serious hindrances that the coffee industry is subject by the continued adulteration with chicory. We now a dealer at the Cape has been fined for selling a mix containing 98% of chicory!!! This is a matter U.P.A.S.I. should take up. The British public have an that a *certain* admixture is necessary for a good cup of c —an idea as erroneous as it is prejudicial to coffee pla generally, when the comparative prices of chicory and c are considered. We rarely, or never, take up our excha without seeing cases of coffee adulteration, but the imposed are so manifestly absurd, considered with the p accruing to the delinquents, that a representation fro influential body interested in the trade to the Lo Chamber of Commerce seems to us the only mea getting the ear of the magistrates and the B.P. gene It is an exploded idea that chicory is essential to make c palatable, and the sooner the impression is driven the heads of the consuming public, the sooner a very l larger demand will be created for a product in which of us are so heartily interested. As a substantiatio what we have written above, we append an account case before the Drumcollogher Petty Sessions:—

At the Drumcollogher (Co. Limerick) Petty Sessions, on Ju David Kelly, grocer, Drumcollogher, was summoned for selling of coffee containing chicory.—The defendant proved that the was sold by him in the same condition that he had received it the wholesale merchant.—The magistrates said they believed there was no intention on the part of Mr. Kelly to defraud, and were of opinion that the article sold was the same as was receiv him for coffee. They, however, were bound to convict, and h fined 6*d.* and costs.——Miss Margaret Abern was prosecuted alleged similar offence. The canister from which the sample supplied to the sergeant was produced, and the label on it state the contents were a mixture of chicory and coffee.—A nominal pe was imposed.

The Rivalry of China. If China awakens! When C awakens! Ceylon and Indian planters must not be over-sanguine because they have s gained ground at a tremendous rate in the race ag China. If the hare should awaken, what odds agains tortoise? And the chance of the hare awakening be

look less remote than it did some little time ago. A ome paper remarks "that an incident in the past tea season s the use at Wenchow of a machine-roller which proved yond doubt that the most ordinary China tea is capable astonishing improvements if treated by modern methods. enchow tea made by the old native process is of the most ferior description, but, by being carefully made and achine rolled, a very fair drinkable tea resulted. A mpany under the auspices of the Commissioner of Customs Hankow, Mr. R. B. Moorhead, has been formed to periment in this line in the Hupeh tea districts, the safety men and machines being guaranteed by Imperial edict. somewhat similar company is already working in Foochow d has had some measure of success. It is now enlarging operations. The Chinese Government, Mr. Mansfield ys, appears at last to be awakening to the fact that the a trade is rapidly slipping away from their country, and ere are signs that it will be willing to make some conces- ons to encourage measures for the improvement of the tea oduced. A very efficient and feasible way, he suggests, ould be to grant facilities to foreigners to take up land the tea districts, so as to introduce more careful cultiva- on of the plant, and to offer a premium in the shape of a rge reduction in duty on tea prepared by modern ethods. 'The wisdom of such a course would appear vious, for if the measures for tea improvement were owned with success, the revenue would soon recoup itself r the reduced duty by increased export, while in the event failure, the revenue would simply revert to its present oting.'" And Ceylon? And India?

---

dian Sugar. In the House of Commons on the 23rd ultimo, Lord George Hamilton oke on the Indian sugar trade, and as this industry and possibilities excites considerable attention, and may entually attract capitalists to this country, we append e speech of the Secretary of State for India:—

"The estimated amount of cane sugar produced in India during ordinary season has been variously estimated at from three d-a-half to five million tons. The number of large sugar factories shown in the latest Indian returns as thirteen; the return of pital for these factories is incomplete; for those factories which ade returns the capital employed ranged from one and-a-half lakh 16 lakhs a-piece. Most of the sugar produced in India is made at nall village works where bullock-power is employed. I have no formation regarding any sugar factories worked by water-power, paying rent to Government for such power. The quantity of ounty-fed sugar imported into India during the year ending arch, 1898, was 107,452 tons, or about two and-a-half times the tal of the previous year. I have no information to show how much this sugar came in bounty-fed vessels." At the present time it oes not really pay to manufacture refined sugar in India, because the large imports of bounty-fed sugars into the country. The roprietor of one of the largest sugar works in India writes to us as llows:—"You could not have failed to have observed during the st three or more years that the price of the raw produce (*goor*) has latively been very dear, while the manufactured sugar has been ry cheap. At the moment here the *goor* of the district, with its per cent. of treacle, is selling to-day for *one anna a pound*, while y best white sugar, polarizing 99·5 per cent., is to-day worth only *e anna and nine pice per pound!* At the same time I may tell you at the 'diffusion' process of sugar leaves all competitors behind." ur correspondent adds that, owing to the fact that it does not pay manufacture refined sugar in India, he was about to close his orks and go home! Another correspondent writes to us as follows this subject:—"*Re* your article on the Indian Sugar Industry, No. 29, India can never drive other competitors out of the ld while she is handicapped by the bounties with which Continental States subsidize their exports. I have studied the subject very closely for the last twenty years, and have written a good deal about it. And in my opinion the Indian Sugar industry is far more likely to collapse altogether than to be further developed, unless bounties are abolished, or an increased import duty is imposed by the Government of India on foreign sugar."

Tea and Coffee Markets. *Tea.*—We learn from the *Produce Markets Review*, dated London, July 23rd, that, owing to the unattractive quality of the bulk of the tea brought forward, the demand shows no improvement, but prices generally are steady. At this early period of the season the proportion of really good teas is generally exceptionally small, and the reports from most of the districts, so far, are not favourable to an early improvement in this respect. Teas from the Assam and Dooars districts are described in the Calcutta advices as thin in cup, although of fair quality, and this is fully confirmed here, as most of the supplies so far received are deficient in strength. From Darjeeling the reports are more favourable, but from Cachar and Sylhet they are not satisfactory, either as regards quality or quantity. That there will be an increasing trade, when the arrivals are up to the average of former seasons, there can be no doubt, particularly for teas worth 9*d.* and upwards, as the market is practically bare of both old and new season's teas at these prices. For next Monday's sale a large quantity is catalogued, and if a good selection of the better teas is offered, a brisk demand at firm rates may be expected. At the public sales 7,069 packages were brought forward, but the bidding was anything but active, buyers preferring to wait until the supply is larger and of more attractive character.

Coffee.—The auctions have again been very poorly supplied, and with a slow demand only a portion has been sold. The few lots of fine quality have alone met with any competition, and the prices for these are well maintained, recent arrivals showing a more marked falling off in quality than is usually the case at this time of the year. The supply of common Costa Rica is still in excess of the demand, and rather lower prices have had to be taken to effect sales, but the market can hardly be called lower. For East India there has been some enquiry, and a few parcels of bold have fetched rates fully equal to those ruling at the commencement of the season. A shipment of washed Santos of the new crop was offered yesterday; the quality was good, but buyers were not willing to pay the prices asked. In the terminal market very little has been done, and quotations have slightly eased off.

Horse-breeding. As some of our subscribers are interested in this enterprise, we

recommend them to the *Journal of the Royal Agricultural Society of England*, where a most interesting article on the "Mare and the Foal" will be found in their issue, No. 34, of 30th June. It has surprised us why those who have invested capital in horse-breeding always take the lower slopes for their operations. We admit that the climate of the Nilgiris is irregular, but a magnificent crop of lucerne and rye could be grown if sufficient attention was given to it, and the "stock" would be free from the ravages of wild animals. The great drawbacks to the successful issue of such venturs, in the past, has been the destruction of valuable brood mares, when they are *forward* towards foaling, and by the acquisition of good land in the higher slopes, this difficulty would be, to a great extent, avoided. We might take, for instance, "an estate" within Ooty itself, with some 250 odd acres of land, where some 125 head of cattle of any kind could easily be pastured. As we do not anticipate anyone going in for horse-breeding alone, we would suggest appending a dairy farm and poultry yard. The latter requires only a moderate capital, and will be sufficiently remunerative to provide a fair provision for maintenance of home and establishment. We are not now writing locally, but refer not only to the many hill stations, but, say, Waltair on the east, and Mangalore on the west, and plantations generally where, with care and upervision, a home farm thrives, and is a sure and certain source of income. But the possibilities are many. Why, with the advantages granted to us in the many ranges of hills in the Madras Presidency, should we not at any rate make an effort to supply the Government requirements for artillery and remounts. Is it not rather a standing disgrace to our internal progress that we have to indent on Australia and England for all our military requirements? We are perfectly certain that, with even small encouragement in the way of Government providing two or more stallions—not rubbish, but those whose produce would be accepted at a marketable value—there are several men who would willingly put a few thousands of rupees into such a venture, and look forward to a fair to large dividend after the first few years, which would be devoted to the establishment of a farm on a thorough basis. For ventilating new ideas, the "sleeperites" of the Madras Presidency generally scoff, but we wish to impress on those who, with success or otherwise, have invested on the several ranges of the Madras Presidency that they have let a very certain source of income evade them. We do not quite believe that even the U.P.A.S.I. can have the power to convert the Government on its currency theory and practice, but an Association, with such representatives as Mr. Geo. Romilly and Mr. Acworth, might induce Government to start on this very lucrative business, by providing planters with a few well-reputed stallions. Even if their services were given at a moderate fee, the planters would do the rest.

Low Country Coffee Cultivation.

Apropos of a recent visit of sundry planters and others to Mr. Justice Minakshaiyya's irrigated coffee-plantation near Bangalore, the local "intelligencer" of the *Madras Times* writes :—

"The plantation contains ten thousand plants, which will be three years' old next month, and which is expected at the coming crop to yield between three tons to three and-a-half. Twenty thousand other plants will be two years' old next month, and are estimated to yield about a ton as a maiden crop. Yet another twenty thou plants are just about ten months' old. The first two shou believe, yield not less than ten tons next year, and the third a one ton. And all fifty thousand plants two years hence sh yield at least fifteen tons a year, not to speak of what next y planting may yield still later on. The estate covers forty-five a at present, and there is an area of about thirty-five more acr land suitable for extended planting, making a total of eighty a And these eighty acres ought to yield, in full bearing, that is, they are three years' old, twenty-five tons at least. Two very reservoirs, at the head of the plantation, fed by a natural sp irrigate by gravity about thirty-five acres, and another in the m of a sloping valley irrigates another twenty acres. Besides there are two stone-built wells, which irrigate about ten acres. two natural perennial water-courses, in irrigating about fifty a save about Rs.5,000 a year, which should otherwise be spent irrigation at Rs.100 an acre. The present establishment is m tained at a cost of Rs.3,200 a year, and this establishment, calculated, will suffice for another thirty-five acres, and with the of extra manure for future planting, the total expenditure coul put down at Rs.4,000, when all the eighty acres are planted, th Rs.50 an acre, with a yield of from six to seven cwts."

The "intelligencer" continues:—"These facts," (the by the way, a considerable blending of speculation with facts!) "should be of interest to all those who believ the cultivation of coffee in the low-country and its m advantages compared with *Mulnad* cultivation. I h had an interview with Mr. Murray-Aynsley on the sub of the outing, and what he, as an acknowledged expert coffee cultivation in Southern India, thinks of the H hully estate. He tells me that this was his second visi the plantation, and that he found it looking very m better than before. All the plants were coming on a g deal, but he thinks they might be still further improved the introduction of shade trees. Mr. Murray-Aynsle entitled to speak with special authority on this point, f the fact that he has a low-country estate doing very out at Devanhully, where he gives the plants as de shade as can be got for them. For want of this aid mature growth he noticed that the Herehully plants w looking rather forced. Mr. Murray-Aynsley cultivates much as seventy acres of coffee at Devanhully, and obtai a very fair crop last year, in spite of short rainfall and very dry years preceding it. He attributes this succes the good influence of unrestricted shade, and considers t when this advantage is sufficiently recognised and is val with the cheapness of manure, the accessibility of lab and the absence of malaria, coffee cultivation in the l lands of India should become very general, though, would admit, the marketable value of the bean so produ would never come up to the hill-grown article." W the exception of this last bit, the report in very optimis but there are other irrigated coffee-plantations besi Mr. Minakshaiyya's. We should be very glad to hea any one of them has proved successful, from a finan point of view. We believe that few, if any, experien planters share the opinions attributed in the above Mr. Murray-Aynsley.

LETTERS TO THE EDITOR.

TO FORK STEEP LAND.

SIR,—There is no patent about my method for forking st land,—only a little "common sense," and *some* supervision. first thing to do is to cut a road along the top of your field w

sloped in (not a drain, hateful word!!) about three feet wide. When starting to fork leave about two feet from the bottom till unforked, and then start, and turn over an *honest* sod of earth, driving the fork well in, and work up the line, letting each sod overlap the other. If this is carefully carried out, I will defy wash on the steepest land.

"KOLA."

HYBRID COFFEE.

SIR,—As the production of hybrid coffee is a matter of undoubted interest to all Coffee Planters, will you kindly allow me space, with reference to my advertisement in *Planting Opinion*, to explain that the small estate was opened with the view to obtaining hybrids, and that last year I found, on several of my Liberian trees, a considerable percentage of *comparatively* small ripe cherry, which led me to believe that my experiments had succeeded. The seed was planted in a nursery and germinated freely, but unfortunately, during my absence, the nursery was entirely destroyed by fire and not a plant saved. As both species, however, flowered at the same time last March, I have, and not unreasonably I think, every hope of success in the near future.

"HYBRID COFFEE."

CO-OPERATIVE SALTPETRE REFINERY.

SIR,—With greatest interest I have read "Toda's" contribution on the subject. Yes, he says that he has got some little knowledge, but I say that he has got a proper knowledge, while he was in the Salt and Abkari Department he has learnt much of it, and when he is sure of helping his brother planters by supplying the stuff at a cheap rate I would advise "Toda" not to depend upon the subscription, and as he has got plenty of buildings on his estate, he can store up and sell at five per cent. profit, but if he has no funds to provide for its expenditure, he being a "Toda," he must have plenty of buffaloes, of which I would advise him to sell and make use of it; as he gets the principal and profit he can buy some more buffaloes than he sold, and he could easily travel on his buffalo, but not rely upon others' money. Will "Toda" be good enough to give the address of the Refiner who told him that he would supply at Rs.290 per ton on rail at Coimbatore? Will "Toda" be good enough to let us know if he has tried the stuff for his cultivation, and what result he had of it? Or if he knows any one who tried and got a good result? Time for me to graze my cattle and I conclude for the present.

GOWDA.

[Though the above is evidently written with some idea of "Toda's" personality, with which we in no way agree, it does, however, emphasize the opinion we hold, that to make a venture which has great possibilities for planters a thorough success, the identity of the promoter should be revealed, and the scheme started with a pucka debenture subscription.—ED.]

A CO-OPERATIVE SALTPETRE REFINERY.

SIR,—I have read your remarks in your issue of 30th July which precede my letter on the above subject; and you do me less than justice when you say, "We fear 'Toda' will never forgive us for writing like this." It is patent that, as you say, "your remarks are based on nothing save a sincere desire to ensure the success of a scheme which may mean such a lot to the planting community," and I am not so silly as to object to criticism which rests on that basis. Whether the refinery I have suggested is or is not a "commercial venture" is a matter of opinion which any planter interested in the subject can decide for himself. From a careful perusal of your remarks, I take it that the only *vital* point on which we are at variance is "cost of manufactured article." Regarding this you write, "As to this we are vouchsafed no information, and, indeed, are told 'this calculation does not enter into the question now.' In all new undertakings a certain amount of confidence is necessary, but surely this is carrying it to excess, &c. &c." When you say, "We are vouchsafed no information," you overlook the fact that, in my first letter, I put the "cost of manufactured article" at Rs.50 per ton. I have been at some pains to obtain reliable details, and from my present data the cost works out to Rs.1-12-0 per Bengal maund of $82\frac{2}{7}$lb., or, say, Rs.47 per ton. This may be a little out one way or the other; to be on the safe side, I put the figure at Rs.50. But I cannot speak with *absolute* accuracy, or give the odd annas and pies until our refinery has actually outturned a ton of refined saltpetre. And in quoting my words, "this calculation does not enter into the question now," you have quite mistaken the sense in which those words were used. The position I take up is a very simple one, and is just this. To make a ton of refined saltpetre it actually costs the refiner or B licensee X rupees. For this ton the planter has always to pay X+Y rupees, and often X+Y+Z rupees, Y and Z being the profits of the refiner and Estate Agent respectively. A refinery on the lines I have indicated could outturn a ton at X rupees, and every subscriber could purchase a ton for X rupees, saving Y and Z. It was in this sense,—that our refinery could make refined saltpetre at the same cost price as the present B licensee, *whatever that price may be*—that I said, "the cost need not enter into the calculation now." But to pursue this subject further would be to split straws; as, from the concluding para. of your remarks, I see that the experiment of a private refinery has already been tried, with the result that, to quote your own words, "the initial outlay was only Rs.500, and he managed to secure an excellent article at a cost of only fifty rupees a ton," that is at precisely the price I named when suggesting my scheme of a Co-operative Refinery, this definitely settles the "cost of manufactured article." Our initial outlay would necessarily be higher, as—with the demands of 25 subscribers to meet—our refinery would have to make a larger outturn than that of the refinery put up by the gentleman you allude to, who presumably tried the experiment merely with the object of satisfying his own requirements. Advances to Upiliyas would have to be larger in our case. I have already estimated the total sum required to start the Refinery at Rs.1,250, that is Rs 250 for plant, &c., and Rs.1,000 for advances. This latter sum would, of course, be recoverable, so the actual outlay would be only Rs.250. My proposal, therefore, can hardly be called a 'Hooley flotation'!

One word, in conclusion I have already said, and I would repeat, that I do not look for the smallest personal remuneration in any way whatever. Having applied saltpetre on a small scale with results I can only characterise as marvellous, I am fully alive to the benefit to be derived from a more extensive use of this valuable fertilizer; but, on the other hand, I object to pay the exorbitant price now demanded. Only the other day I was speaking to a neighbouring planter (who has joined the scheme) on this subject, and he told me he had recently purchased saltpetre from a firm dealing in manures at Rs.200 per ton, and that on examining it he found it contained a large proportion of sand! Contrast this with the good saltpetre our refinery would outturn at Rs.50 per ton. In order to reach the end I have in view—the production of a really good article at a reasonable price—it is necessary not only that some one should take the initiative, but that he should be prepared to take considerable personal trouble in arranging the various details and starting the refinery. As I happen to have studied the subject of saltpetre manufacture, that personal trouble I offer to take, in order that I, in common with the other subscribers, may be able to obtain really good saltpetre at Rs.50 a ton. Now that it has been shown that saltpetre of this description can be made at this low price, I do trust the necessary number of planters will signify to me their

willingness to subscribe. For if the Refinery is to be established at all, a start must be made very soon, as little, if anything, can be done over the N.E. Monsoon sets in.

I thank you for your offer to put me in communication with the gentleman who has already successfully tried the private manufacture of saltpetre, and that offer I gladly accept, as he will be in a position to afford me valuable data.

TODA.

GENERAL ARTICLES.

A BREAK.

FOR the last few days the flood gates of heaven had been opened ;—rain,—rain,—nothing but rain, from sunrise to sunset, and from sunset to sunrise—a dreary, weary, howling downpour. At length, however, symptoms of a break began to make themselves manifest ; gleams of intermittent sunshine alternated with passing heavy showers, and towards evening the wind ceased its wail and almost died away. This morning we awoke with a sense of an item wanting—a factor in the complex machinery of life-missing, and as the chain of one's thoughts began to revolve in more systematic unison, one remembered—yes, where was the ceaseless drip—drip—which had for the last few days harbingered "more rain." It was early dawn as I awoke, and the birds outside had only just commenced to herald in the advent of another day. As Noah many a lang time syne looked out from the shelter of his ark and saw "that the waters had abated," even so, I, looking out, from my window on the 30th day of the VII. month of this year of grace 1898, saw that everywhere "the waters had abated." Let me tell you, gentle reader (or otherwise), what I furthermore saw. In front of me lay a low undulating series of hills and hillocks, clothed with verdure and bounded at their furtherest extremity by the massive Nilgiri range, ten miles distant, for value and hollow nestled snug and peaceably, vast billows of fleecy cloud, far in the distance, rose the greater hills, their summits standing out abrupt and clearly defined. Slowly light began to dispel this twilight dawn ; slowly, nevertheless surely, until an opalascent haze testified to the near arrival of Phœbus, surely there he was rising, an arc of gleaming gold. He rose higher and still higher until he stood forth pinnacled upon a hill top changed now into a sphere of luminous silver. Cloud and mist, billow upon billow began to disperse, not hurriedly but with languid ease like leviathans disturbed and loth to move. Gradually this curtain lifted laying bare to one's enraptured gaze "Nature." Everywhere had she donned a mantle of brighter hue ; open sward, appeared a vivid green where forest and spinney existed here the green still was best toned down in depths of woodland to an almost purple, and yet not everywhere, for jutting from the distant hill sides could be seen great groups of rock wet with the dew of morn and glistening veritable "tears of gladness in the eyes of sorrow." Yet a little while, and the land lay basking in the sunshine of a beauitful cloudless day.

A gentle breeze fanned one's brow
A wind that had
"No more strength than this,
That leisurely it blew
To make one leap, the next to kiss,
That closely by it grew,"

and moreover, amidst all this joy, amidst all this beauty breathed an air of calm of peace, the peace of God which passeth all understanding.

GOOD NEWS FOR TEA PLANTERS.

OUR tea-planting friends will be glad to read the following intelligence from a reliable source as to the prospects of an increased demand for our teas in Russia, Turkey, Asia Minor. A London correspondent writes :—

"You will, I am sure, be glad to know that friends of the known Rood Lane Firm in the North, who last year found the c for Rogivue, have this week finally concluded an agreement w gentleman introduced by the same Firm, and who has been e lished in the Tea Trade in Constantinople for many years, to getically push British-grown teas in Turkey, Asia Minor and P so you see the Rood Lane Firm have again been instrument finding people with ample capital and business ability to take u development of the trade in British-grown tea in the countries mentioned. I believe it will not be long before we shall see a many million pounds of Ceylon and Indian tea diverted to direction, viz., Russia, Turkey, etc."

From another quarter we have late news of tea f London in the following forms :—

"Consumers are asking more and more for quality and flavo the tea rather than more strength of liquor, and consequently t is a wider difference in value between good liquoring parcels an ordinary run of Pekoes and Broken Pekoes. The few invoic new season's fine Indian teas have sold at high prices, while good to fine Hankow teas, which sold at a good profit to impor have been resold at a profit up to 2*d.* per lb."

Very appropriately, to present another side of a mu discussed question, here comes to us the opinion of a co spondent who ought to know a good deal about Ceylon estates and the teas they turn out. He evidently thi that the factories turning out good teas as ever are exception ; for he writes :—

"I will say that the salvation of Ceylon lies in making better such as we used to make five years ago when men managed t own factories and did not leave it to a teamaker. It can be d but men are too lazy, or else have not been taught how. Tea-mak is an art, not a system ; what suits one day may not do for the n and what are wanted are more brains and perseverance in the Fact The field work is excellent."

Gentlemen with first-class factories—plenty of space and po and superior tea-makers—are not required to notice this opin —*Ceylon Observer.*

AN AGRICULTURAL CHEMIST FOR SOUTHERN INDIA.

(*Communicated.*)

THE *Planter* publishes, as "communicated," a remarka effusion on the above subject. We sincerely trust that f of our readers share the whole of the opinions expressed the writer, who says *inter alia* :—

The South Indian planter has the fatal habit of procrastinat which, our copy book tells us, is the thief of time, and which he fi robs him of his opportunity as well. It did so in the case Dr. Leather, the Government of India chemist, who was enga and was at work for five years in the country, before the plante the south discovered that he would be of any use to him and enterprise, and was considering the way in which his services wo turn to account. Before he made up his mind, Dr. Leather finis his term of service with Government and vanished. This plant community is hardly pet alive to the value of science to its indus Twelve months ago the U.P.A. at Bangalore promised to give subject of entertaining the services of an agricultural chemist special consideration, but a year has elapsed, and it does not app that the subject has advanced beyond the stage of consideration. it has done so nobody is aware of the fact. We shall probably kn when the proceedings of the forthcoming conference at Bangal

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

are published. Meantime the services of two oxperts have been offered to South Indian planters which they seem disposed to let slide as they did those of Dr. Leather for what must be considered very inadequate reasons. One is the offer of the Mysore Government which thinks it cannot find sufficient work for an expensive all-time expert in that province, and, asks planters in Southern India to say what employment they can find him and what they can contribute towards his emoluments. When South Indian planters originally proposed to get out a chemist for themselves, they calculated on the support Mysore coffee planters would give the scheme. The Mysore Durbar's proposal cuts away this support, and without it they feel themselves stranded, but the circumstances would seem to justify their throwing in their lot with Mysore in this matter and giving the supplemental pecuniary aid which it deserves to give effect to its project. But not so. In a spirit that seems hardly commendable, they have resolved,—or at least one of the largest Planters' Association has done so,—to withdraw altogether from the Mysore project, and this courso, at least for the present, will leave them without such a useful adjunct to their industry as a chemist. ..... South Indian planters don't want to pay for the whole cake, but all the same want to eat it, and are not satisfied with only the part they can afford to pay for. This is a spirit similar to that which led to the rejection of the offer of the Mysore Government and has little to be commended.

SOME INTERESTING FACTS ABOUT RUBBER.

We have to thank *Indian Gardening* for the following interesting extract :—

We are all interested in information concerning this article, and the particulars embodied recently by Dr. Morris in the first of his series of two Cantor lectures on "The Sources of Commercial India-Rubber" may be of service to our readers. Since the days when Le Condamine first described the rubber tree of Brazil, and Don Jose, King of Portugal, in 1755, sent several pairs of his royal boots to Para in order that they might be covered with the waterproof "gum-elastic," the use of the India-rubber has enormously increased. Besides the demand in almost every department of arts and manufacture, the rapid development of cycling, and of the use of rubber tyres for carriage wheels, has added largely to the increased consumption of this interesting article. The quantity of raw caoutchouc imported into the United Kingdom in 1830 was only 23 tons. Even in the year of the accession of our Queen it was only about 200 tons. Last year it had increased to 20,000 tons—exactly a hundredfold. The present value of the imports is about £5,000,000 sterling. The total trade is probably not less than £10,000,000 sterling. More than one-third of the imports is now received from British possessions. In 1888 only about one-fifth was so received. It is estimated that the world's consumption of rubber is 60,000 tons, of the value of £14,000,000 sterling. This stupendous quantity of raw material is laboriously extracted from the milky juice of trees and shrubs belonging to three natural orders, viz., the spurges (*Euphorbiaceæ*), the nettles (*Urticaceæ*), and the dogbanes (*Apocynaceæ*). These plants are distributed over nearly every part of the tropical zone—none are found in the temperate zones, the most important being found in the vast basin of the Amazon, an area almost as large as the Continent of Europe; others are found on the east and west coast of Africa, in Assam, and the Malay Archipelago. Hitherto, the preparation of India-rubber has depended upon the crude hereditary art of a semi-savage people, the rubber-hunters who explore the depths of tropical forests and obtain the rubber milk at the sacrifice of millions of trees, which, owing to the recklessness with which they have been treated, are yearly decreasing. The result is that many localities where rubber was once abundantly obtained have almost ceased to produce it. New sources of supply have, it is true, been found in West Africa, especially in Lagos, the Congo State, and Portuguese South-West Africa. But here also the work of destruction is rapidly going on. The collectors have to go farther and farther into the interior, and the cost of transit is thereby greatly increased. An account was given by the lecturer of an important discovery whereby rubber could be extracted from the milk in a perfectly pure state. This is a mechanical contrivance on the principle of a cream separator. This was likely to prove of great value in the preparation of Central American and some West African rubbers, where the milk flows in an appreciable quantity, and it is capable of being brought in by the collectors. It would be indispensable on regular plantations of rubber trees. By such means the process of preparing the rubber could be kept under scientific control, and all injurious substances, such as proteids, and all dirt and chips, excluded. The value of rubber so prepared has been shown to be increased fully 25 per cent. The exports from Para, 1897, including rubber received from Bolivia, Peru, and Venezuela, amounted to 22,650 tons. Of this amount 51 per cent. was shipped to the United States, and 38 per cent. to the United Kingdom, leaving only 11 per cent., or 2,500 tons, for all other countries. The price of Para rubber, which regulated the price of all the other sorts, has been steadily increasing since 1894, when it was 2*s.* 11*d.* per pound; in 1895 it rose to 3*s.* 2*d.*; in 1896 to 3*s.* 4*d.*; in 1897 to 3*s.* 6½*d.*, while the average price for the first three months of 1898 was 3*s.* 9½*d.* At the last sales, on the 15th July, it was 3*s.* 11*d.* per pound.

THE INDIAN COFFEE & PEPPER EXPORTS, 1897-98.

Mr. Ralph Tatham, Messrs. Arbuthnot & Co's Agent at Tellicherry, has issued his customary Annual Statement of Exports of Coffee and Pepper. This gives statistics for the year ending 30th June, 1898, and the total figures approximately represent what the crops of these products in India for the year in question amounted to. Mr. Tatham further shows the distribution of shipments to foreign ports, and gives the figures relating to exports for the three previous years for the purpose of comparison. He remarks :—

"*Coffee.*—I pointed out last year that the crop of 1896-97 was remarkable as being the smallest exported from India for many years. I regret now to have to add that it is no longer a record year, the crop for the past year showing a further falling off of some cwts. 8,585. I am glad to say that estimates for the coming year would appear to point to the fact that we may expect a considerable improvement when dealing with the figures of the coming crop. Of the quantity shipped this past year, cwts. 121,517 may be regarded as plantation and the balance cwts. 81,658 as native coffee, showing an actual increase in plantation coffee as compared to the previous year of cwts. 4,335 and a falling off in native coffee of cwts. 12,920. The value of plantation coffee this past year was Rs.64,40,401 and of native coffee Rs.35,92,952, calculated at Rs.53 and Rs.44 per cwt., respectively, which I consider an average value for the year, allowing for the difference in prices obtained for the produce of the several districts in which the crops were grown. The total value of past year's crop may, therefore, be taken at Rs.1,00,33,353 as against that of the previous year, which I estimated at Rs.1,35,48,478, but, as already shown, last year's crop compared unfavourably in quantity with that of the previous year, and in addition the coffee market was weaker to the extent of an average of some Rs.15 per cwt.

"*Pepper.*—The total exports of this spice amounted to cwts. 125,231, or some 44 per cent. less than what was shipped last year, the value of which, at an average of Rs.24 per cwt., amounts to Rs.30,05,544. The price of pepper averaged Rs.6-8 per cwt. over that of the previous year, and the bulk of the business was done with Calcutta. I do not think that last year's actual crop was shorter

THE INDIAN TEA ASSOCIATION.

Extracts from the Report of the Assam Branch.

THE total number of gardens belonging to the Assam Branch Indian Tea Association is 146 against 144 last year, representing an area of 124,963 acres, or approximately 49,985,200lb. of tea against a total estimate for the Assam Valley, for the present year, of 69,851,522lb. of tea.

I would again impress upon all present the advantages of an Association such as ours. Strength is in numbers and unity, and I would ask each one individuaily to use his influence in getting those now standing aloof to join.

There have been various calls on us during the past year for contributions to various funds, and I am pleased to see the sum collected for the famine fund amounted to Rs.3,530-8-0, collected entirely by private contributions.

Extracts from the Proceedings of the Association.

The following resolutions were proposed and carried:—*Proposed* by the Chairman, *seconded* by Mr. D. A. Campbell, that proceedings of the General Committee during the past yea confirmed, the report adopted and the accounts, as audited be p as correct. Proposed by Mr. D. A. Campbell, seconded by M Traill:—That the rate of subscription for the current year each garden belonging to the Association be fixed at one ann acre under tea cultivation. Proposed by Mr. A. F. Bruce: seco by Mr. C. de C. Richards:—That with the view of obtaining gr exactness and reliability in the estimates of the tea crop, the statement of figures shall not be issued until it is also possib give details of the tea manufactured up to 15th August, and th further statement be issued until the actual outturn of the cr published.

Extracts from the Report of the Association.

INDIAN TEA IN AMERICA.

The campaign in America on behalf of British-grown tea has carried on during the year by Mr. Blechynden, the representati the Indian Tea Association, and Mr. Mackenzie, the representati the Ceylon Planters' Association, generally on much the same as before, except that a larger amount of money has been spe advertising, and a smaller amount allotted as subsidies to the who are assisting in pushing the trade. The result of the lev 1897 was, on the whole, satisfactory. The subscriptions collect Calcutta amounted to Rs.1,02,039, in addition to which a su £200 was contributed by a Company in London, which had hitl held aloof. The total amount compares favourably with the r of the levy for 1896, which amounted to Rs.1,03,674. Liberal co butions have again been received from the two Planters' Associa in the Travancore District, for which the General Committee d to record their grateful acknowledgments. The Committe London having decided that the operations in America shou continued for another year, a circular was again issued on the of April in the present year, asking for renewed contributions the Committee have every reason to hope that it will meet wi least as much support as the previous year's levy. At the time the Committee have again to express their regret that a large number of tea concerns still hold aloof from contributing t Fund, while, at the same time, deriving equal benefit with subs ers from the resulting extension of trade. They desire to r what they have before pressed upon the attention of members that it is only reasonable that an enterprise undertaken fo general benefit should be generally supported on the ground common interest and of a common advantage. The American Foreign Tea Committee of the London Association have, as issued an interim report, dealing with Mr. Blechynden's work, was published in February last, and was accompanied by an abs from Mr. Blechynden's report for the year 1897. Mr. Blechy appears to have exercised great care and judgment in distribu his advertisements in view of reaching the largest possible numb the tea-drinking population. He has also personally visited of the large centres where British-grown tea is being sold, satis himself that the spirit as well as the letter of the arrangements by him is being adhered to. The special agreement under whic representatives of India and Ceylon agreed to work conjo instead of in competition has, there is no doubt, been the mea arriving at distinctly more satisfactory results than would othe have been the case. Messrs. Gow, Wilson and Stanton's stat of Indian and Ceylon tea taken by North America during the 1892 to 1897 show a steady annual increase in the trade, the fi for 1897 giving a total of 11,362,000lb., almost equally di betwen India and Ceylon, against 9,624,000lb. for the year In connexion with this important matter, the General Comm have again had under consideration, at the instance of the Lo Committee, the question of approaching Government with a vi raising a fund for the exploitation of new markets by means of to be imposed on exports of tea in India, in much the same way a been done in Ceylon with marked success for some years pas will be remembered that a proposal of this kind was made som years ago to the Committee, but, after consultation with the mittee of the Bengal Chamber of Commerce, it was decided follow it up in view of the improbability of Government assisti the matter. It certainly could not be carried through wi unanimity among the planting interests, and this would be more difficult to obtain in India than it has been in Ceylon. A same time the Committee consider it would be desirable if

plan could be evolved by which the whole of the planting industry could be made to share in a scheme which is for the common good of all, and from which all derive benefit.

THE RED SPIDER, OR SPINNING MITE.

(*Tetranychus telarius, var. humuli.*)

THE following information is issued by the London Board of Agriculture:—The red spider, or spinning mite, sometimes causes serious injury in hop plantations. In 1868, and again in 1893, this insect did much mischief in many hop grounds. The leaves fell off, the burr or blossom could not develop into cones, and in some instances the plants were completely shrivelled up. In most seasons, at least in those in which rainfall and temperature are normal, spinning mites can be found upon the large leaves of the hop plants, especially where the soil is shallow, but in the two years just mentioned they multiplied with wonderful rapidity. They were found upon the small leaves high up the poles, also upon the burr, and even in the cones themselves.

In 1897 there were grave indications in the sultry days at the beginning of August that there would be an equally rapid development of this pest; but a succession of showers and a fall in the temperature opportunely checked its ravages. The lower leaves turned yellow in many grounds, and the yellowness was fast spreading up the poles. Upon the under-surfaces of the leaves thick webs were spread from mid-rib to mid-rib, under which the mites were seen actively sucking up the juices. All sorts and conditions were there, varying in size and differing in colour, but the greater number of them were of a light or greenish-yellow hue. Now and then one was seen of a darker-yellowish colour, approaching brown, but this was exceptional. Many eggs, which are perfectly globular, were suspended as it were in space between the mid-ribs, but upon close inspection with a microscope it was seen that they were kept in this position by means of fine threads stretched from side to side.

Life History.—The spinning mite of the hop-plant passes the winter in the perfect state under stones and clods, in the bark of trees, and in the clefts and under the dried rind of hop poles. It is not noticed, at all events in numbers or as actively injurious, unless there is at least normal summer-heat, and it only multiplies in a dangerous degree when the day and night temperatures are abnormally high. In such circumstances the increase in its numbers and the rapid spread of its destructive influence are remarkable. Eggs are abundantly laid, and, as above described, fixed in position by threads. The comparatively large and round egg is pellucid-white at first and finally becomes slightly dark-coloured. The mites emerge from the eggs in five or six days, and at once begin to suck up the juices of the leaves. At first they are pale greenish-yellow in colour with dark patches on both sides of the body; they become more tinged with yellow later, and some very light-brown specimens have been found, but in no case have they been seen of a distinctly red colour.

In the earlier stages of their existence the mites have only three pairs of legs, but the full-grown insect has four pairs. There are two stiff hairs upon each joint of the legs, and the claws are furnished with long, stiff hairs, upon the ends of which, or upon some of them, are little round balls, or pads, supposed, as Murray says, "to be an essential part of the spinning apparatus." The head is provided with a stout pair of mandibles with hooked ends for biting into the tissues of the leaf, and the mouth has a sucking apparatus which is inserted into the tissues. Very far behind the head are the red eyes. On the under-side of the mite, towards the end of the abdomen, there is a "conical nipple," to use Mr. Murray's words, "from which the threads of the web are drawn out and guided by the motions of the mite and by the action of the minute claws and hairs of the legs."

A badly-infested leaf has its under-side completely covered with a dense web, in which eggs are found in abundance, as well as quantities of mites of all sizes feeding upon the juices of the leaf. The leaf becomes yellow, and, as a rule, finally falls off, when the insects escape into the earth. Mites left on the leaves upon the plant retire into the cracks and under the rind of the poles; they have great power of locomotion, and travel very rapidly quite independently of their webs.

This spinning mite of the hop-plant differs in many important respects from the typical spinning mite cited as *Tetranychus telarius* by Murray and other entomologists, and should be defined as a distinct variety, as *Tetranychus telarius, var. humuli*, or even as a distinct species. It is different in shape and colouring from Claperéde's figures of *Tetranychus telarius*, as adopted by Mr. Murray, and as described by many writers. Though it is admitted that the nature of the food-supplies of these mites may affect their colouring in some degree, it does not seem possible that the differences in the food could be sufficient to change the colour from very light-brown, the darkest shade which has been noted in mites upon hop-plants, to reddish or brick-red, which is the colour of the adult typical *Tetranychus telarius*, according to Murray, Taschenberg, and others. It appears to be just as distinct from *Tetranychus telarius* as *Tetranychus cucumeris*, the mite found upon melons and cucumbers.

It is most difficult, and it may be said almost impossible, to prevent these spinning mites from getting on the bine and leaves. They are most agile in movement, and travel up the bine rapidly. Plants on wire and string seem equally liable to attacks, as the mites crawl up the bines. The application of caustic substances close round the hill is ineffectual, as the mites are so tiny that they would not be affected by such materials as lime, gas-lime, or kainit unless reduced to the very finest powder. It would also be impossible to get at the mites in the cracks of the poles and posts for wire work. When a drought commences in June and there is a probability of its continuance, it would be useful to immediately syringe hop plants upon which the mites are seen with cold water, or with water, soft soap, and sulphide of potassium before the webs are made, or before they are plentiful and thick. This syringing must be heavy and frequent, mere spraying will not suffice, as it is well known that the ordinary spraying with quassia and soft soap has a very slight influence upon them. Hop plants that have been sprayed three or four times for aphis-blight have yet remained badly infested by these mites. To be effectual, syringing must be done early, vigorously, abundantly, and with hand machines. When the webs are well established, even the most drastic syringing is often unsuccessful.

Sulphuring, that is applying "flowers of sulphur" by means of a horse machine, which blows the fine particles on and under every part of the hop plants, is supposed by some to have a prejudicial effect on the mites, but it is believed that this is of little if any benefit. Hop plants are sulphured almost in the ordinary course of cultivation, but the mites are not hindered by this in the least degree. Leaves have been examined upon which the webs of the mites were thickly covered with particles of sulphur, and the mites in the webs immediately in contact with the sulphur were lively and unconcerned. Paraffin emulsion has been of considerable effect when used in the early stages of the attack. This is made by mixing 6lb. of soft soap and 7 gallons of paraffin with 100 gallons of water. The soap is dissolved first in boiling water and poured into a tub containing the paraffin, the whole being churned up with a force pump. The mixture is afterwards diluted to the proper strength. It is important that the water used for this emulsion should be soft; it can be made soft by adding soda or borax.

Sulphide of potassium, known commonly as liver of sulphur, the foundation of several washes for insects, has been used with considerable advantage. It is readily soluble in cold water, but it must not be allowed to stand, as it loses strength rapidly. It may be applied in the proportion of 2½lb. to 100 gallons of water; a little soft soap mixed with it tends to keep it upon the leaves.

Liver of sulphur is also a remedy for some fungoid affections of plants, and would probably be more efficacious than sulphur applied in the form of a powder. It is so soluble that it may be put in with soft soap and quassia and with other insectifuges and insecticides. —*The Planter.*

TEA BLIGHTS.

[BY MR. MASSEE.]

"THE field of nature is one of incessant struggle. Every plant has to hold its own in the face of foes bent continuously and relentlessly on its destruction. If it succeeds it is only because its defensive resources are on the average superior to the attacks made upon it. The final result is one of equilibrium, in which foe and victim each manage to survive. This is arrived at through the interaction of conditions usually difficult to trace, but brought into adjustment after a long period of struggle.

"When a man appears on the scene and for his own purposes destroys the adjustment the struggle begins anew with increased severity. He grows some one plant in wide stretches after clearing the ground of its competitors, but in so doing he relaxes the restraint of all its foes and often gives them a chance they have never possessed before.

"Plants and their parasites have to live in nature as best they may. The host can do without the parasite, but the parasite cannot do without the host. A plant may exist alone in a forest, and the parasite which kills it will find its own fate sealed if it cannot transfer its attacks to a neighbouring individual. The straits to which a parasite in consequence is put to continue its existence, and the varied means by which this is effected, form one of the most fascinating subjects of biological study. But the net result is that under natural conditions the parasite is kept in check.

"When any crop is grown on a large scale it is obvious that the conditions are changed. A parasite having by accident fastened on an individual plant in a plantation and done its fatal work can then extend, usually with little difficulty, to contiguous plants. Under such circumstances the spread of a fungoid disease can only be compared to a conflagration, which, beginning on a small scale, may increase to disastrous dimensions. Such troubles are part of the price which man has to pay for disturbing the order of nature. The only way to treat them is to endeavour either to restore the natural checks which man has abolished, or, as this can from the circumstances of the case rarely be done, to substitute artificial ones in their place. And as a matter of practice, by an attentive study of the habits of the parasite, this can generally be effected and the injury it inflicts circumvented.

"The difficulties which beset tea-culture in Assam are only an illustration of these general principles. But the Government of India does not possess any trained mycologist in its service, and no one was available for the study of the 'blights' which affect Indian tea culture, but Dr. Watt, its reporter on economic products. When a similar investigation was needed for the poppy crop, it was entrusted to a gardening member of the staff of the Royal Botanic Garden, Calcutta. Dr. Watt was obliged to have recourse to Kew for the technical investigation of the most serious maladies with which the tea-planters have to contend. The following report has been drawn up, from material transmitted by Dr. Watt, by Mr. Massee, a Principal Assistant in the Herbarium of the Royal Gardens.

GREY BLIGHT.

"(*Pestalozzia Guepini*, Desmaz.)

"The amount of injury caused to the tea plantations by this fungus is estimated by Dr. Watt as follows:—'I regard the grey blight as very alarming, a disease that if not checked may easily reduce the productiveness of gardens by 50 per cent. It might, in fact, convert Assam from the prosperous province the planters have made it to one of extreme distress.'

"An examination of the fungus sent from Assam on leaves of the tea plant showed it to be identical with the parasite common on leaves of cultivated species of Camellia in Europe. The fungus first appears under the form of small grey spots, more or less circular in shape; these spots gradually increase in size, and not infrequently run into each other, forming large, irregular blotches, which often eventually cover the greater portion of the surface of the leaf. During increase in size, the spots are often bordered by a narrow dark line. The grey or sometimes white colour of the spots is equally evident on both surfaces of the leaf, and is due to the disappearance of the chlorophyll, and the subsequent death of the cells composing the tissue of the leaf. The mycelium of the fungus is very delicate, rarely exceeding 2 u in diameter, hyaline, and sparingly transversely septate; it at first occupies the intercellular spaces and runs between the cells, which eventually become separated from each other by a dense weft of mycelium. Finally the mycelium enters the cells and vessels in considerable quantity, causing the death of the invaded patches, the unattacked portion of the leaf remaining quite unchanged. When the leaf-tissue of the diseased patches is quite dead and brittle, the mycelium of the fungus becomes aggregated in numerous dense tufts just beneath the cuticle, more especially on the upper surface of the leaf. On the tips of these aggregations of slender, erect hyphae, or conidiophores, which spring from a basal pseudoparenchymatous stroma, the conidia are borne. As these clusters of conidia increase in size they raise the cuticle of the leaf into a series of minute warts, until finally the tension is too great, and the cuticle ruptures, us in a triangular slit through which the mature conidia protrud soon become free on the surface of the leaf, from which the removed by wind or rain. Such of those as happen to alight o moist surface of the leaf of a suitable host-plant, germinate at enter the tissues of the leaf, and form a new centre of disease, in course of time produces conidia. By this rapid method of co formation and distribution it can be readily understood how po and certain it is for the disease to spread rapidly when once introd into a tea garden.

"The conidia are produced at the apex of slender hyphae or diophores, and are very beautiful objects when seen under the m scope, being narrowly elliptic with somewhat pointed ends, and us three-septate; the two end cells are colourless, while the two m cells are olive-brown, the terminal colourless cells being surmou by four very slender, colourless, spine-like processes longer the conidium itself. The above-described is the typical and abundant form of condition; variations occur in the number of s which range from two to four; the hair-like appendages also from one to four, or are sometimes entirely absent.

"The life-history of the fungus was ascertained from a seri cultures; living conida being obtained from the fungus growin Camellias cultivated at Kew.

"Conidia germinated freely within eighteen hours in hanging cultures in ordinary tap water. The median dark-coloured cel the conidia are alone capable of germination, each cell as a producing a single germ-tube; in rare instances two germ-t spring from a cell, one of which remains rudimentary. On steri bread a dense white superficial mycelium soon appears, on surface of which very minute dark points, consisting of grou conidia, are visible about the third day. Five days after sowing conidia are mature and capable of germination, but bread does appear to be a very suitable medium for the cultivation of fungus, the characteristic terminal, filiform appendages of the co being almost constantly below the number normally present, a certain tufts entirely absent. The spineless condition of coni agrees exactly with the fungus described by Cooke as Hender theicola, parasitic on living tea leaves from Cachar, which is in re nothing more than an abnormal form of Pestalozzia Guepini, has also been observed on Camellia leaves at Kew. Examples of abnormal spineless conidia, sown on plum-juice gelatine, gave o to perfectly normal conidia within a week, in fact only no conidia were produced on the last-mentioned nutrient solu whether normal or exceptional conidia (in so far as the numb apical spines were concerned) were sown. It is quite an easy m to inoculate living uninjured Camellia leaves by placing conid the damp under-surface of the leaf, and keeping it moist for tw three days. No result was obtained when the conidia were pl on the upper surface of the leaf.

"Pestalozzia Guepini is not known to possess any other for fruit or mode of reproduction than the condition described abov

"The disease under consideration is by no means new; specim of tea leaves attacked by the Pestalozzia, now in the Kew Herba are accompanied by the following note: 'Tea leaves (bligh Cachar. 1872 growth. A. H. Blechynden.' A second lot o leaves, suffering from the same disease, is accompanied by a as follows:—'Leaves from a tea tree recovering from 'red spi Sap just beginning to run through them. This tree, like m thousands, has not given any leaf for three months.—T. B. Cu Received from Mr. Blechynden, Calcutta, by T. B. Curtis. Rece from Mr. Blechynden, Calcutta, by T. B. C., October, 1878.'

"The fungus occurs as a parasite on leaves of plants belon to the following genera:—Camellia, Rhododendron, Citrus, Magn Alphitonia, Niphobolus, and Lagerstræmia.

"Owing to its wide distribution at the present day, the orig home of the fungus is difficult to determine with certainty, but amount of evidence at hand suggests an Eastern origin. In I it occurs on Camellia and Rhododendron; in Europe it is b means uncommon, but always on introduced plants belonging t two above-named genera. In the United States it occurs introduced species of Camellia and Citrus, from which it ma possibly have passed on to the native Magnolia. On the other h it occurs on indigenous plants (Niphobolus) in New Zealand, an Alphitonia in Queensland.

"*Preventive Measures.*—If the diseased leaves were collected with the amount of care and intelligence exercised in collecting sound leaves, and burned at once after being collected, the disease would soon be stamped out, as the mycelium of the fungus is not perennial in the tea plant; consequently infection, and a recurrence of the parasite, depends entirely on inoculation by the numerous conidia or reproductive bodies of the fungus present on diseased leaves. Remembering the very different kinds of plants on which the fungus is known to be parasitic, it is very probable that it also occurs on wild plants growing in the vicinity of the tea gardens; if such proves to be the case, all such plants should be removed if practicable, as the conidia of fungi are carried considerable distances by wind, birds, and insects, and no amount of attention in the way of removing the parasite from the tea plants would avail, if the supply of conidia requisite for inoculating the tea plants were formed on other plants growing in the neighbourhood."—*Kew Bulletin.*

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (August 5, 1898) says:—As mentioned last week, owing to the Bank holiday the Public Sales were only resumed yesterday, when a moderate supply was brought forward, consisting chiefly of common Costa Rica, New Granada, Salvador and other Central American descriptions, which sold at about previous rates.

No East India was catalogued.

Futures were firm and fully 3*d* dearer, the early part of the week on moderate receipts, but the recovery was nearly all lost yesterday on large receipts at Santos. So far the receipts at the Brazilian Ports since the 1st ultimd (the commencement of the crop year) to the present date, show a deficiency of nearly 300,000 bags compared with last season, and the trade is naturally much interested in the question as to whether the crop is not only a later but a really smaller one than last season.

COFFEE.—London advices dated 5th inst. state:—The public market was closed until yesterday, when public sales were resumed. Supplies were on a very light scale, only one catalogue being issued which consisted entirely of Central American descriptions; there was a good demand, and practically the whole was disposed of at steady to occasionally higher prices. There has been very little business passing in "futures," and prices, after showing a slight advance, close without alteration, the tone being flat owing to heavy receipts at Santos. We quote:—

London	...Santos	...September delivery	...	29s 0d
New York	...No. 7 Rio	... „	...	5·45 cents.
Hamburg	...Santos	... „	...	30 pf.
Havre	...Santos	... „	...	36 francs
Holland	...Good ordinary Java	...	...	38¼ cents.

Imports Deliveries and Stock of COFFEE in London are as follows:—

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—From the 1st October, 1897, the charge for line advertisements will be: 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N.B.—Remittances should be sent to the Manager, "Planting Opinion," 11/12, Second Line Beach, Madras.

IMPORTANT NOTICE.

The Business Offices of this paper having now been removed to Madras, all remittances should be made payable to the Manager of *Planting Opinion*, 11 and 12, Second Line Beach, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should be addressed to Coonoor, as usual.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 9th September, 1898.

Season Reports should be sent to the Printers, Messrs. ADDISON & Co., direct, and not to *Planting Opinion* Office.

Coorg.

POLLI BETTA, *1st Sept.—Weather.*—It has been one long break throughout the past fortnight. It may be judged what rain we have had when the total registered for the month to date is barely 4 inches. *Plant-diseases.*—Leaf-disease has only showed up in small patches, few and far between. The coffee generally throughout the district is looking in splendid condition. *Labour.*—But few fresh arrivals, but they are coming: sufficient for present requirements. *Health.*—Good. Price of grains high. Paddy transplanting continuing.

Kil Kotagiri.

26th August.—Weather.—No rain again this week. Wherever it is possible to turn water into the estates it has been done. All the places are suffering very badly now, and I am afraid the whole crop will go light. A few beans turn red that leave nothing inside them. Estimates are being reduced throughout the district. Young Clearings that have been planted out this year are doing badly on account of the short rain, and it is feared that if rain does not come within a week, most of the plants will be past help. *Health.*—Fair; worse amongst planters than amongst coolies. *Labour.*—There is more labour in the district than we can give work to.

PESTS AND BLIGHTS.

WE hear a great deal more of competition between Tea and Coffee, and of the conflicting interests of coffee-planters and tea-planters, than of the fact that, from the scientific point of view, there are many similar features in the life of the tea-plant and that of the coffee-plant. This fact shows that the growers of these two rival plants should have a good deal to learn from one another. In the matter of pests and blights, for instance, the coffee-planter can learn a good deal from the results of investigations of the diseases of tea-plants; and *vice versâ*. It is questionable,

however, whether any planter takes up a book on a subject other than that of his own particular product in the hope of learning something that may be useful to him in regard to it. We propose to try to show that he might often do this with great advantage. First, we will take the case of a coffee-planter, for old though the industry is, it is yet behind tea in the matter of scientific investigation. Let us glance for a moment at Dr. WATT's recent book on *The Pests and Blights of the Tea Plant.* In the first place, it is on record there that Dr. WATT has been "compelled to realise that remarkably little value can be placed on insecticides." Is there any satisfactory evidence that what applies to Tea in this connection does not hold equally good as regards Coffee? If there is, we should like to have it before us, and to submit it to Dr. WATT for remark. Then there are other words that surely apply to cultivators of coffee as well as growers of tea:—"The process of trying effects is one of blindly groping in the dark so long as we have no grounds for our experiments. And this state of affairs, as it seems to me, has come about more by accident than anything else. The planters have only to be pointedly told that their co-operation is indispensable to any solution of the complex problems of the tea-pests and blights, to ensure a large body of willing and careful observers. The time and money spent in trying experiments with insecticides had far better be directed to an intelligent effort to trace out the habits of pests." Perhaps Dr. WATT is over-sanguine about the large body of observers, but he asks a pertinent question when he says, "Why should we, for example, be unable to say where red-spider hibernates?"

A similar question, *mutatis mutandis,* might be applied to every pest and blight from which the tea and coffee plants suffer. Is it necessary to await the investigations of a scientist before deciding what a particular pest is, or what treatment should be adopted for its extermination? Experience has shown that it is *not.* There are many planters who are quite competent to study effects so closely as to acquire a very fair idea of causes; and if such men will but carry their researches to the farthest possible point, they will find that scientists will be able to help them even from a distance. Dr. WATT points out that pests and blights must not be too readily regarded as *causes* of disease. They are often mere *consequences* of an unhealthy state of the bushes. This is a point that an intelligent and observant planter will frequently determine for himself. Such men have been at work among us for many years past. Some have taken their brother planters into confidence as to the result of their study of blights, etc.? Others have not. If all who investigated matters in a quasi-scientific, or even in only a practical, manner would but make the results known, comparisons between one man's reports and impressions and another's would undoubtedly lead to a sounder knowledge on many points of interest than is now possessed. The broad lines of Dr. WATT's conclusions regarding Tea apply equally to Coffee. For instance, liberal and rational treatment—remarkably few blights. Exhaustion from age is a less serious danger than defective cultivation—so that many of the pests and blights will have to be dealt with "by changes in the systems and principles of the agricultural operations pursued."

Lest the above remarks might be read as meaning that Coffee has much to learn from Tea and can teach it nothing in return, we add a few words on the subject of Hybrids. Here, we think, successful experiments with Coffee demonstrated the soundness of some of Dr. WATT's deduc from the unsatisfactory results of some instances of na hybridisation of Tea. In one place Dr. WATT rema "Hybridism has hitherto been left to Nature; it ha fact, been regarded as an unavoidable evil instead of recognised as one of the possible means of solving question of blights or of effecting improvements in yield and quality of tea." Coffee-planters have at leas the length of realising the useful effects of hybridisa They have done more: they have found that what be termed the foreign sire leads to one set of re while the foreign stock and the "home" sire yield t different results. Dr. WATT sees that there is a proba of something of this kind occurring with tea; but w sure that he would be interested in reading the resul actual experiment and experience on the part of c planters in Southern India. With Tea, he says, the h is more liable to Mosquito; in like manner red-s appears first of all on China and few hybrid teas, rare Assam. Similarly, certain hybrid coffees have been to suffer greatly from leaf-disease, while others have en entire or comparative immunity. Dr. WATT merely re in one place that "it seems possible that the female eleme the inferior hybrids may have been the China stock." in Southern India, experiments with Coffee have affo results that might almost be said to justify the re that Dr. WATT's "guess" regarding Tea is correct. be so, then Tea has, indeed, learned something from C And if our quotations from Dr. WATT serve the purpos which they are intended, they will convince our reader coffee-planters as well as tea-planters may learn a good by a careful study of *The Pests and Blights of the Tea* There are general lines of resemblance between the diff sections of plant life, just as there are many poin difference. The Laplander and the Fiji islander offe widely divergent specimens of the human race; but the organs differ less than the features and physical forms. action of the heart, the lungs, the muscles, is much the in both cases; and though the one man may be most to the diseases from which the other suffers least, the many from which *both* suffer. So it is with Tea and C There are many points of resemblance as well as of d ence; and the study of ascertained facts concerning th should certainly help to improve our knowledge of the

THE CURRENCY QUESTION.

FROM Reuter's telegrams to the Press and a private gram from the *Pioneer's* London correspondent we that a blue-book was issued on the 25th instant conta 319 closely printed pages of the evidence given befo Currency Committee up to the date of adjourn Twenty-four witnesses had been examined, includin James Mackay, Sir Frank Forbes Adam, Messrs. J O'Conor, Stephen Ralli, Robert Steel, Allan Arthur, North Christie (Ceylon), Francis Harrison, James Fair Finlay, Alexander Lindsay, Cave Browne, William (Ceylon) and Charles Cox, Sir Henry Waterfiel Edgar Vincent, Sir Antony Macdonnell, Sir S Montague, Baron Rothschild, Messrs. Leslie Probyn, Acworth, Henry Coke and Ewan Cameron. The evi of the above gentlemen is said to deal minutely with

spect of the Currency question, in relation to the finance, nd the import and export trade of India and Ceylon. mong the proposals for meeting the deficiency estimated o ensue if the mints are re-opened are the raising of the ustoms duties 10 per cent.; the doubling of the salt tax; ncreasing the railway rates; an export duty on jute; an xcise duty on manufactured articles; and doubling of the ncome-tax. But it is admitted that each expedient is kely to yield only a fraction of the amount required. large majority of the witnesses are, however, opposed to he re-opening of the mints. The schemes of the Indian overnment and those of Messrs. Lindsay and Probyn are lly discussed. The Government's scheme is approved ordially only by official witnesses. Many of the witnesses ecommend a gold standard even without gold currency, ut Lord Rothschild considers this unfeasible, and thinks hat the late enormous increase in gold production ought o facilitate India's acquiring the reserve necessary for a old standard.

It is understood that the Committee have been unfavourbly impressed by the evidence and suggestions of the re-open the mint" witnesses. Not only Lord Rothschild, ut also Sir Samuel Montague (lately an ardent Bimetallist) nd Mr. Raphael stated that the gradual accumulation of a old reserve would be necessary for the introduction of a old standard. They agree that this was practicable without affecting the money market to an undesirable extent. Mr. Lindsay, of the Bank of Bengal, and Mr. Leslie Probyn xpounded their respective plans. The evidence of the ormer was very clear. His plan was admitted to be ngenious, but the adoption of any artificial system is conidered unlikely. Sir Antony Macdonnell gave important vidence concerning the incidence of land assessment and nternal trade. He and other official witnesses appear to ave tried to disprove the statement persistently made ere that the reduction in the value of silver ornaments ollowing the closure of the mints had caused discontent in ndia. Sir Antony asserted that there were two ornament uyers to one seller. These witnesses also asserted that the redictions regarding serious illicit coining were groundess. On these two points there must, however, be much nore to be said. "Two buyers to one seller" is a very eal phrase, but what about *prices?* The gist of the whole natter lies in the present *value* of ornaments as compared with the value in, say, 1891. As for the illicit coining, the act that it is increasing appears to be established by the ecords of Indian and Ceylon Police Courts.

According to the *Pioneer,* further evidence will be taken n October. The present tendency of opinion, it is confidently stated, shows that the question of re-opening the nints is considered absolutely extinct. Government must proceed to the effective establishment of a gold standard with a rate of sixteen-pence, accumulating a gold reserve nd ensuring the convertibility immediately success is ssured. To meet the present prolonged monetary tringency, close attention will be given to the maintenance f a sound financial position. The Committee, it is thought, vill probably recommend a plan which, while not identical with any of those suggested, will yet aim at containing the best elements in each.

Elsewhere in this issue we give the statement made to the Committee by Messrs. G. L. Acworth, T. N. Christie and the Hon. Mr. H. P. Hodgson. Only the first two of these gentlemen were examined. We also give an interesting report of an interview with Mr. Lindsay on his return to Calcutta.

CEYLON'S SCIENTIFIC EXPERT.

Mr. Bamber has been engaged for twelve months as Tea Expert by the Planters' Association of Ceylon, who have thus got the better of the Indian Tea Association, which was considering whether it should or should not make Mr. Bamber an offer. It is yet too early to say what this gentleman will do in his new position, but his work should be watched with interest by South Indian planters. They, too, should follow carefully the actions of Ceylon planters in regard to the new appointment, for human nature is much the same in the island as on the continent. In fact, there are already signs of the conflicting interests the effect of which was foreseen in Southern India when the employment of an Agricultural Chemist was seriously discussed. It appears that the Thirty Committee in Ceylon have made a grant of £1,000 to meet the cost of the new appointment. It is thought possible that typical estates might be taken from different parts of the island—estates of different altitude, rainfall, soils, &c., and they should arrange for Mr. Bamber to visit and report on those estates, his report being, of course, public property for the use and advantage of all members of the planting community. From the report of the proceedings of a meeting of the Dikoya Planters' Association held on 25th ultimo, it is abundantly evident that all planting districts are likely to raise the cry: "The money used is partly ours; take care, that at least one of your 'typical estates' is selected in our district." It is not an unreasonable cry, but it shows where there must always be a very weak spot in any such arrangement as that made with Mr. Bamber. Then, too, the question has been raised: "Mr. Bamber is to be paid by the 'Thirty Committee;' can he undertake any private work?" And the question, "Who is to select the typical estates?" is not yet definitely answered. These points have an interest for planters in Southern India, for it may be safely prophesied that similar points will come up for settlement here whenever an Agricultural Chemist is employed, whether by Government or by the U.P.A.S.I.

Since writing the above, we have learnt from the *Times of Ceylon* that twelve estates will be selected for experiment, but details are still to be settled by the Thirty Committee.

NOTES.

The Nelliampathies. It is reported that new capital is finding its way to these Hills, and that the area under cultivation is being steadily increased. If Leaf-disease and Scale Pests will but spare the Nelliampathy Coffee-shrubs, there may be a glorious future before the compact planting community of those parts.

Estate Coolies in Ceylon. During the quarter ending 31st March last there were about 295,000 immigrants on Ceylon estates. Of these 104,000 were in the Kandy district, where there are 472 estates, and 88,909 at Nuwara Eliya, where the estates number 251. It is interesting to note that the births far exceeded the deaths in number.

Tea in the Wynaad. The Wynaad correspondent of the *Madras Mail* reports that tea is looking exceedingly well, and further extensions appear under contemplation, despite exchange and low prices. It should, however, be borne in mind, he adds, that great uncertainty exists as to the future of the tea market, and that a potent factor in governing the value of such produce is associated with China.

Batta for Jurors. A Minute by His Excellency the Governor of Ceylon announces that Planters and Superintendents of estates (Europeans and respectable descendants of Europeans) and Native planters, proprietors, and Superintendents of estates of not less than 150 acres in extent in cultivation, residing more than ten miles from the Sessions town, shall be entitled to special rate of batta of R7·50 per day.

Advertisement! A correspondent who has been to the "Indian Show" in Berlin writes from that city to a Colombo contemporary :—"I am glad to find that Mr. John Hagenbeck is so well advertising 'Ceylon Teas.' It is the best advertisement of Ceylon teas I have yet seen. 40,000 visit the exhibition weekly, and all cannot fail to see the beautiful tea-house, besides the large advertisement, and get a taste of real Ceylon—if they like."

"The World's Coffee Crop." A correspondent informs us that our recent figures (issue of 27th ultimo) were wrong, and as *Capital* gave them in the same way, he concludes we took them from that paper. He is incorrect in this, but our Calcutta contemporary and ourselves no doubt culled from the same bush! The mistake was just a trifle of three oughts, whereby millions were converted into thousands of millions! This was in the figures for 1870 and 1890.

Indian "Financing." The Government of India has floated a 3½ per cent. loan (rupees) at about Rs.94-12-0. The Great Indian Peninsula Railway Company has floated in London £250,000 3 per cent. debentures, with the guarantee of the Secretary of State for India in Council, at an average price of £100-2-2. Where, then, is the economy of rupee loans? With, say, 5 per cent. in hand at the beginning and ½ per cent. saved every year, the sterling arrangement does not appear more risky than the rupee one!

Calcutta Tea Sales. The Calcutta Tea Sales of 26th August were the largest this season; 26,000 packages were sold. The competition was fair, the quality being generally common, however. Buyers were cautious, buying at lower rates than last week. A few good Assams fetched fair prices. Fine teas are badly wanted, and are likely to meet with a good reception. There was a good demand for Bombay and outside markets at low rates. The exports from Calcutta to Great Britain to the above date stand at 42,750,000lb. compared with 43,500,000 for the corresponding period of last year.

Japan Tea. The tightness of money in Japan is said to be seriously embarrassing the tea trade there, and the rise in wages and in the prices of general commodities in recent years has likewise b severely felt by the planters. It is again stated th considerable decrease in the production of tea in Ja will be a feature of the present year. The Central Guild of Japan is, however, attempting to arrange for training of the *quality*, and is urging the producers in Ja to improve their methods. The Guild is also establish tea inspection offices in Yokohama and Kobe, with object of preventing the exportation of inferior tea.

Heavy Pruning of Tea. There has been much co spondence on this in Colombo of One planter avows himself a staunch believer in he pruning. He says the tea bush likes it! He says :—

"I have seen a heavy belt of big gum trees brought down havoc to look at the tea bushes planted below them. Branches off and stems split for 18 months are as fine looking tea and y ing as freely as the surrounding tea. No; heavy pruning is going to kill our tea."

But the Editor of the local *Times* observes :—

"That heavy pruning provides an artificial stimulus to the p causing it to throw out wood freely, every one is aware, but tha tree actually likes it, or that the more it gets the better it is, w hardly bring ourselves to believe."

Malaria and Mystery. The somewhat mysterious sile that has been observed regard the result of Surgeon-Major Ronald Ross' investigatio Malaria is resulting in the usual "leakage." A correspon writes to a contemporary that Dr. Ross' theory of the di bution of the malarial parasite by the agency of mosqui has now been accepted by all the leading authorities malaria in Europe, and he has conclusively proved it u the hilt, by means of experiments, as also its passag and through birds. He is even said to have recent Calcutta succeeded in infecting a number of sparrow different occasions with the malarial plasmodium, an birds it seems to take in a very virulent form, from w they generally die.

Coffee in North Wynaad. A recent visitor to North Wy gives a glowing description of progress made in coffee extens in that quarter, containing, as it does, perhaps the r remarkable property developed in the taluq during the few years. Here a block was taken up about three an half years ago by some South Coorg planters, who opened it on what may be termed the "Coorg princi and have succeeded (in less than three years) in bringi very considerable extent of land under coffee, and in a ma

hich reflects much credit on the resident manager and all llied in the enterprise. The *Madras Mail's* Wynaad correpondent can recall the time when the impression existed hat "Ichabod" might be inscribed over the fortunes of Iorth Wynaad, but, he says, our Coorg friends may now ith pardonable pride say *nous avons changé tout cela.*

---

hina's Rivalry. There is a silver lining to the China cloud that the planter is warned to egard as threatening disaster, the deluge, &c. From "The Consular Report on the Trade of Hankow," it appears that profits in China are cut finer than here. The Hankow Consul notes that in the case of Indian teas the profit on apital employed is said to be as much as 7¾ per cent., while the profit per lb. made on teas sold averages 2-2/10*d.* The average profit on Hankow teas is estimated at about ½*d.* per lb., and it is evident that, in the event of any serious competition between Indian and Hankow teas, the latter could be driven out of the market, while the former would still fetch a handsome profit. There is now no demand for Hankow teas in London, except for such chops as can be laid down at not over 5*d.* per lb., and at this price decent sound teas are expected.

Coffee in the Wynaad. According to the Wynaad correspondent of the *Madras Mail,* coffee generally looks extremely well, though leaf-disease, which usually is in evidence (except on the higher elevations) in July, has at last begun to show up prominently. Whether the attack will turn out severe will probably be determined more or less by the character of the weather during the next few months. With sunny mornings, or showery drizzly afternoons, "rust" works its evil effects more acutely than in heavy rainy and cloudy weather. On the one hand young tea wants rain, whereas the coffee would be much benefited by a rainless break of three weeks. In another note the same writer says that one peculiarity in connection with the present light monsoon is the prevalence of leaf rot on isolated coffee bushes, situated in highly-manured fields, away from hollows, and the inimical influence of excessive *shade,* the rot having asserted itself on coffee after a June handling.

Tea & Coffee Markets. There has been a better selection of the finer teas brought forward at the sales, says the *Produce Markets Review,* and active competition prevailed especially for Assam growths, which are decidedly firmer. The comparatively small supply of fine tea will no doubt keep prices at a high level, at any rate until the imports become larger. That there will be a decline on current values later on is almost certain, especially when the trade have sufficient stock to meet their immediate requirements; meanwhile, buyers will no doubt purchase cautiously until increased quantities are forthcoming. The demand for the medium kinds has been fairly active at steady rates, the market being more liberally supplied with these descriptions. On the other hand, the common grades were keenly bid for and prices remain very firm, there being but a limited quantity available under 5½*d.* On the whole, the lower kinds of new season teas are inferior to old imports, and in most cases give a poor infusion. Darjeelings continue about equal in character to those previously offered and attract but moderate attention, although they are obtainable at comparatively easy prices. The public sales comprised 20,889 packages, mainly consisted of this season's imports, and 3,220 were withdrawn. *Coffee.*—With the exception of Tuesday, when four small sales were held, there have been no auctions this week, and they will not be resumed until Thursday. Only a small business has been done privately, although there has been rather more enquiry for the commoner grades of Guatemala and Salvador. At the present low range of prices for the cheaper qualities of Costa Rica importers are not anxious to sell, and, in consequence, have not pressed supplies forward, and they will, in all probability, continue to act in this way until there is a better demand. The finer qualities have maintained their value, and more business has been done in East India. Plantation Ceylon continues to fetch extreme rates, while Mocha is rather dearer. In the terminal market quotations have rather hardened, but only a small business has been done.

Tea Companies. The report of the *Imperial Tea Company* for the year ended December 31st last states that the season, as a whole, has not been a favourable one for quantity or quality. In South Sylhet and Cachar the long-continued drought seriously retarded the growth at the beginning of the season. Rema division was severely damaged by hail in April, which so punished the older planting that it was considered advisable to leave the bushes unplucked, while Kuttal was subjected to a heavy loss through persistent sickness in the labour force. Such an unhealthy season has never before been experienced in this district. The Dooars gardens yielded well up to the middle of June, when blight made its appearance on the largest division, where the short fall amounts to 33 per cent. of a carefully-framed estimate; Assam was disappointing throughout the season in both quantity and quality, while Darjeeling quality was pence below the average of former years. The total yield was 2,092,469lb., against the estimate of 2,668,000lb. Of this 2,092,469lb., there were sold in Calcutta 1,621,694lb. at an average of 6 annas 1 pie and 470,775lb. in London at an average of 7.564*d.* The revenue account for the year shows a balance at credit of £2,491, out of which the dividend on the cumulative preference shares at the rate of 5 per cent. per annum from the date of allotment and payment of calls absorbed £1,385, leaving a balance of £1,106, which it is proposed to carry forward. The total crop for 1898 is estimated at 2,863,520lb.—The *Upper Assam Tea Company* has applied for the sanction of the court to a proposal

for the reduction of the capital of this company. Counsel stated that the original capital of the company was £250,000 in shares of £10 each. Of these shares 18,925 had been issued and fully paid up, the paid-up capital in respect of them being £189,250. In 1872 the capital was increased by the issue of 2,000 preference shares of £5 each, carrying a dividend at the rate of 15 per cent. per annum. These were all issued and fully paid up. Since that time the business of the company had not been very successful, and there had not been sufficient profit made to pay the dividend on the preference shares; so much so that the accumulated dividend on those shares had amounted to 15 guineas per share. A scheme has now been proposed and sanctioned by all the interested parties by which the 18,925 £10 ordinary shares were to be reduced to £1 shares fully paid by writing off £9 per share, thus involving a reduction of the capital of the company by £170,325. As regarded the preference shares, it was proposed to cancel them and to issue to the holders of each preference share 13 ordinary shares of £1 each in full satisfaction and discharge of all claims in respect of such cancelled shares. The result would be that the total capital of the company would be £79,675, divided into a like number of shares of £1 each, of which 44,925 would be issued fully paid. The misfortunes of the company were attributable to a succession of bad seasons. The matter stands over for further consideration.—*The Hapugahalande Tea Company*, Limited, shows a falling off, in consequence mainly of the fall in prices of tea and the rise of exchange. Tea in full bearing, 235 acres; New clearings, 150 acres; Jungle, &c., 369 acres 1 rood and 3 perches. Total 754 acres 1 rood and 3 perches. The quantity of tea manufactured during the season (including estate and bought leaf) was 188,455lb. Estimating the unsold tea at a safe valuation and excluding a surplus of Rs.528·50 on last year's crop, the nett amount realised for this product totals Rs.61,057·74, which is equal to 32·39 cents per lb. An interim dividend of 5 per cent. was paid on 1st March last, and a final dividend of 4 per cent. was declared at the annual general meeting on 27th ultimo. Authority has been granted to the directors to borrow £2,000 if need be to meet the expenditure incurred in opening up Uralindatenne.

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U.P.A.S.I.]

THE Government of India (as "patron" of Coorg and the Cochin and Travancore Governments) have expressed their inability to render any assistance in the matter of the engagement of an Agricultural Chemist for Southern India. The planting interests of Cochin are not large, but those of Travancore are so important, and are expanding so rapidly, that the decision the Administration of that State has arrived at is regrettable. However, if the excellent example set by Mysore is followed only by the Government of Madras, a good deal will have been done towards the settlement of a most important matter. In other parts of the world the need of specialists in agriculture as well as in medicine, law, etc., is being more and more appreciated, and fresh indications of such appreciation are constantly broug notice in the Press.

In regard to Import Duties on Artificial Manures, Gov ment has exempted nitrate of soda, muriate of po sulphate of ammonia, sulphate of potash and kainit s The notification to that effect appeared in the *Fort George Gazette* of 26th July, 1898.

On the subject of railway freights on Artificial Manu the following information has been gathered: The *Ma Railway* classifies them first class at owner's risk and se class at railway risk, but superphosphates are conveye owner's risk in waggon loads of 270 maunds at the s rate as ordinary country manure, bone dust, etc., viz., 0 pie per maund per mile for distances 200 to 300 miles, 0·148 pie for 300 miles and over. The *East Coast Rai* classifies manure as first class, chemical manure as first at owner's and second class at railway risk. The *S Indian Railway* classifies common and artificial man together.

The supply of the 1897 Book of Proceedings ran sh To prevent a recurrence of this with the 1898 book, wh is in the Press, planters might kindly register their or early. If, through District Associations or by direct p card, each member of the community will state his requ ments, all shall be supplied as soon as the book is read probably towards the end of this month. Names addresses should be written clearly.

CEYLON TEA HAS NOT DETERIORATED.

Two well-known Planters come forward and support Mr. Bag assertion that Ceylon teas have not deteriorated. And they reasons for the faith that is in them. We gather from a pri letter received from one of them, however that, whilst he does believe that there has been any falling off in the quality of the plucked from the bush, he is inclined to think there is some det ration in the quality of the manufactured article. He does not so in as many words, but he very pertinently points out that if n estates some years ago obtained high prices for their teas, in probability it was because they were then securing a smaller quan of tea per acre, and had ample withering space to deal with the put of the estate, which, on many places, is not now the case. can only mean that owing to the large quantity of tea now c with in many factories and the inadequacy of the arrangements withering, &c., the same attention is not now given to the te used to be the case, with the result that the quality is not so goo it was. We do not see what other inference can be gathered this admission. Mr. Metcalfe is, however, strongly of opinion no deterioration has taken place in Ceylon tea at all, and adva as a reason for this that he has reports from London on his which say they are as good as ever they were. But though we very pleased, indeed, to hear this, we submit that the instances qu are hardly numerous enough to generalise from. We are not ass ing, let it be understood, that Ceylon tea *has* deteriorated, no far as we are aware, have we ever made any such dogmatic asser But bearing that opinion expressed on all sides, both in Colo and London, we think it well that the matter should be caref investigated, and it is chiefly for this reason that we have welco the appointment of Mr. Bamber as scientific analyst, as we fi believe that any faults which are attributable to mistakes in ma facture are the more likely to be discovered and rectified. We con we have not much faith in the theory that the actual leaf on the has not the same strength or flavour in it as it once had, and, th fore, suggestions that shade trees amongst the tea, or the increa age of the plant, were responsible for whatever was amiss have ne had very much support from us, though we consider the argume important enough to discuss and enquire into. If anything is wr we have always felt sure it would be found in the factory, and f

the very first we have drawn attention to the need for more careful supervision in the factory, and denounced the Ceylon practice of putting a poorly-paid native in entire charge of the tea-making, whilst this work in most Indian factories is under the direct personal superintendence of a skilled European. For this reason we have urged on the Planters' Association the advisability of employing the services of someone who, like Mr. Bamber, can carefully go into the matter of manufacture in all its many phases and report on it analytically and chemically for our benefit. Our correspondents say there has been no falling off in quality, but they do not say that the large quantities of tea now dealt with in up-country factories have in every case the same relative amount of withering space and attention that used to be the case when the total output of the same estate was a quarter the quantity now manufactured? Whatever is amiss we firmly believe is remediable, and it is for this reason that we have not ceased, in season and out of season, to direct attention to the matter. Let us glance at what our fellow-planters in India have been doing in the last few years. In the year 1888-9 the average for all India was about 10·42*d.*; in the same year the Ceylon average was 10¼*d.*—practically the same. Last year the average for India was, roughly speaking, just under 9*d.*, whilst the Ceylon average was just under 8*d.*, so that in the same time our teas have fallen 1*d.* more than Indian teas. When we come to compare our position in this respect with that of once despised Assam the disparity is even greater. We quote as follows from Messrs. Geo. White & Co's last yearly report :—

Ceylon average	...	1895	8⅞*d.*
	...	1896	8¼*d.*
	...	1897	7¾*d.*
Assam average 9 months	...	1895-6	10⅛*d.*
	...	1896-7	10⅜*d.*
	...	1897-8	10⅛*d.*

The low grown teas of Assam have maintained their price, that is to say, on a constantly falling market. We only wish we had been able to do the same. We cannot help thinking, therefore, that what Assam planters have done Ceylon men can do. It is, of course impossible to lay down hard-and-fast rules on such a subject as this, and on a number of estates, no doubt, all that skill and care and unremitting attention can do to maintain, and, if possible, to improve the quality of the tea has been done. In such cases we have every reason to believe the result has been satisfactory—*vide* the experience of Mr. Metcalfe, but he must admit that this has not been the case on every estate. Indeed, we heard the other day of a Superintendent who had not tasted his day's make for months, the bottom was burnt out of his kettle and his cups were stored away in some undiscoverable cupboard. Yet he fancied he was giving great attention to tea manufacture! He knows better now, and is, we believe, making much better tea. So far from any harm having been done to the enterprise by the light that has lately been let into the methods of manufacture practised on too many estates, we feel sure great benefit has been derived. The whole planting community is now hard at it trying their level best to turn out the best possible tea their estates are capable of, and we shall be very much mistaken if results in improved prices do not soon manifest themselves, not for a time only, but for a considerable period. Our belief is that we have touched bottom in prices, and provided only that the same care in manufacture is maintained, we see no reason why prices should not improve, presuming, of course, that no large extension of cultivation is undertaken for some time to come.

COFFEE.

The following additional extracts from the report on Coffee by Mr. Frank D. Hill, United States Consul at Santos, are a good deal more instructive than the brief cuttings on which we commented last week :—

Varieties of Coffee and Coffee Trees.

"Of the twenty-two varieties of coffee plants (a rubiaceous plant whose original habitat was Abyssinia), four belong to Asia, eleven to the west coast of Africa, two in Central and East Africa, and two in Mauritius. Among the different varieties, the following may be enumerated: Arabian, Mocha, Myrtle, Aden and Bastard. Moorish; Marron, of Rèunion; Monrovian, coffee of Gaboon; Saurine, yellow coffee (*cafè amarello*), red coffee (*cafè vermelho*), and the common coffee of Mexico and Central and South America. All these varieties are variously subdivided, taking name from the districts where they are produced or from ports whence they are shipped. For example, Brazil coffees are Rio, Santos, Bahia, Ceara, etc.

"The ordinary coffee shrub is an evergreen plant that grows to a height of about twenty feet, with oblong, ovate leaves. The fruit is a fleshy berry, having the appearance and size of a small cherry. Each fruit contains two seeds, embedded in a yellowish pulp, the seeds being inclosed in a thin membranous endocarp.

Regions Suitable to Coffee Culture.

"The regions best adapted to the cultivation of coffee are well-watered mountain slopes, at an elevation of from 1,000 to 4,000 feet above sea level, in latitudes lying between 15 degrees north and 15 degrees south, although it is cultivated with success from 25 degrees north to 30 degrees south of the Equator, where the temperature does not fall below 55 degrees Fahrenheit. Frost is a deadly enemy of the plant, and excessive heat hinders its normal growth. The low, hot lands of Mexico, the Carribbean Sea region—which produces the best cocoa in the world—and the South Atlantic are not adapted to its culture, the coffee lands in all these regions being found on the highlands that rise from the sea. On the American continent, coffee is produced all the way from Paraguay to Mexico; the Argentine Republic, Chile, the United States and Canada being either too far north or south for its growth.

"The shape, size, and colour of the seeds are the points that determine the commercial value of coffee. The shape depends upon the particular part of the plant upon which the seed grows, the size upon the nature of the locality of the growth, and the colour on the degree of maturity of the fruit at the period of gathering the crop.

"Brazil is the great coffee country of the world, being credited with 66 per cent. of the total product. Nearly all the twenty States that form this vast Mesopotamia extending from the Amazon to the River Plate produce coffee; but the true coffee zone is confined to the States of Rio de Janeiro, Sao Paulo, Espirito Santo, and Minas Geraes—Sao Paulo being the banner coffee State. This coffee finds its outlet at the ports of Santos, Rio de Janeiro, and Victoria.

Coffee in Sao Paulo.

"A few words as to the cultivation, harvesting, preparation, grading, marketing, and exporting of coffee from the State of Sao Paulo.

"Plantations.—Plantations are usually made on hillsides—the plant growing even in crevices of rocks—plants being placed at intervals of ten or fifteen feet. Hillsides are preferred because less subject than low lands to frost. At the age of four years, the tree begins to bear; it reaches its best at ten years, but continues to bear up to twenty and even thirty and forty years. The life of a plantation properly cared for is, however, about thirty years. Frosts and droughts damage crops here: insects very little.

"Harvesting the Crop.—The first flowering appears in September, and the berry ripens in April or May, when the gathering of the crop begins. The berries are stripped by hand. The berry contains two grains, with the flattened sides toward each other, each covered with an inner membrane called *pergaminho*, and a thicker outer coat called *casquimho*, and the outside tough rind or shell, *casco*. To remove these coverings, the berry is passed through the *despolpadar*, after having been washed in shallow cisterns. It is then dried—either spread out on a cement-covered pavement, called *terreiro*, in the sun, which is the old way, requiring about two months, or by the modern method of steam, which is used on the large *fazendas*, or plantations. After drying, the coffee, still inclosed in the inner and outer skins, is passed through machinery to prepare it for marketing.

This machinery consists of the *ventilador* or windmill, *brunidar* or *descascador*, and polisher or sheller.

"Marketing the Crop.—The crop begins to reach Santos about May, the largest receipts being credited to the latter part of the second semester of the year. Formerly, the planter sent his product to Santos in bags of any size, and the *commissario* (his agent, a very important man in coffee business) placed it in the standard coffee sack of sixty kilograms (132,276 pounds) for export. In Rio de Janeiro there is still a class of middlemen called *ensaccadores*, who buy from the *commissario* and sell to the exporter, reaping a profit on the resacking. In this State, on the contrary, the planter sacks his own coffee in the regulation sack. The *commissario*, who is accustomed to advance large sums of money on growing crops, receives, besides interest on these loans, a profit of 3 per cent. for his intervention in receiving the coffee and selling it to the exporters. This sale is made by a coffee broker, who receives 75 *reis* (1.05 cents) per bag from both buyer and seller. It will be perceived that the commissions of some of the leading brokers on large sales made daily afford a very comfortable income. The last man to be considered here is the exporter or his agent. He is, of course, the natural business enemy of the others, as he represents foreign interests who are desirous of buying as cheaply as possible, and he wishes to obtain a margin. Some of the large export houses, as Naumann, Gopp & Co., Zenner, Bulow & Co., and Goetz, Hayn & Co., buy direct to some extent from the planters, thus cutting off all middlemen.

"Business Methods.—A publication of the National Association of Manufacturers has the following on the methods of doing business at Rio de Janeiro and Santos:

Rio de Janeiro and Santos are the principal ports from which coffee is shipped. The manner in which the coffee business is conducted in Rio is somewhat different from the method followed in Santos, and a few remarks on the subject may be of interest. In Rio the *commissarios*, or planters' agents, sell to the *ensaccadores*, or intermediates, who classify and sack the coffee. Each coffee-exporting firm employs its own brokers to buy from the intermediaries. The broker's interest, therefore, is to act solely on behalf of the exporter, and, as he is well posted on the stock and requirements of the market, and as the intermediaries have the coffee ready for sale, duly classified, he can generally procure the exact number of bags of any type he may be instructed to purchase.

It is not so in Santos. There the planters' agents sell direct to the exporting houses, employing their own brokers. The latter's interest is, therefore, with the growers. The coffee is not classified as in Rio, but is simply sold in lots. An exporter who has to execute an order for a certain type of coffee may have to buy in excess of his needs, in order to be able to separate and obtain the quality and quantity required. The remainder, should it not be of a standard suitable for shipment, must be disposed of in the market. In either case the exporter naturally regulates his invoices so as to cover any loss the transaction may entail. It will be seen that with greater capital and the employment of thorough experts to buy the coffee, the Santos market offers every inducement to exporting houses. They would not only save profits, by saving the intermediaries' commission, but often, by careful selection and judgment in shipping, surpass their expectations.

"Coffee Grading.—Coffees are graded in this market as follows:

"Fine.—Consisting of clean coffee of regular bean.

"Superior.—Bean regular in size, but may contain a few husks or black beans, called 'quakers'—sticks, stones, and dirt not allowed.

"Good.—Evenness of bean not absolutely insisted upon; may be black beans or husks, and even a few broken beans, sticks, stones, and dirt excluded.

"Regular.—In this grade defects appear, large quantities of black beans, hulls, stones, sticks, or dirt.

"Ordinary.—Contains foregoing defects and some broken beans.

"Triage.—The last or lowest of grades, is made up of broken beans, and has all the other defects enumerated.

"In the vernacular (Portuguese) these six grades are *fino*, superior, *bom*, regular, *ordinario*, and *escolha*. The berry is sometimes coloured before shipment and sometimes milled. The export firm of Rose and Knowles is successful, and another mill is being built, whose owner proposes to mill 500,000 bags (66,000,000 pounds) a year. Coffee, for the Cape of Good Hope, for example, is artificially coloured black to meet the taste of that market. There are two classes of beans—flat and round—and this determines the classification of the The former is the Java, the latter the Mocha type. The pea-berry, or Mocha type, represents 3 to 6 per cent. of the p tion. It is graded to-day 2 *milreis* above the 'base' or st price. The same tree produces both varieties."

TEA.

EFFECTS OF HIGH EXCHANGE AND INCREASED PRODUC

MESSRS. GOW, WILSON AND STANTON, 13, Rood London, E.C., have published an interesting paper on Effects of High Exchange and Increased Production o Tea Industries of India and Ceylon." The diagrams which this is illustrated cannot, unfortunately, be r duced here, but we give below the gist of the Lo brokers' remarks, which have a double aim: (1) to i "those affected" to use every endeavour to have w practically a differential tax on British-grown Tea rem and (2) to impress upon planters the need for forcing products into new markets. Incidentally, Messrs. Wilson and Stanton show to what extent the efforts al made in this direction have succeeded.

They say:—

On broad lines it may be said that Tea is produced in currency and paid for in gold currency. In other words, a very large percentage of the price obtained for the article has converted into rupees, in which the producing expenses are The higher the gold value of the rupee, the fewer rupees w seller of Indian and Ceylon produce get for his sterling pric when the rupee is worth 1*s.* 4*d.* the pound sterling exchang only 15 rupees, while it exchanges for 20 when the rupee is only 1*s.* The Industries are now of such vast magnitude that of 1*d.* in the exchange means a difference of more than £4 sterling to the producers. The artificial value recently given rupee by the closing of the mints by the Government of handicaps the growers of India and Ceylon in their compe with their rivals in other Tea-producing countries whose curre ruled by natural laws. . . . . The rupee fell steadily from 1886 to There was a very slight recovery in 1889, and a rapid rise in which was due to the passing of the Sherman Act by the U State's Congress in that year. A heavy fall took place in 189 continued until 1895, when the rupee went as low as 1*s.* $1\frac{5}{8}$*d.* fo average of the year. Then, at last, the closing of the mints to tell, and the gold value of the rupee rose gradually to 1*s.* 2 1896 and 1*s.* $3\frac{1}{2}$*d.* in 1897. . . . . For a few years previous to 18 producer had been able to combat the almost persistent fall i London average price of Indian and Ceylon tea by the decline value of the rupee, and notwithstanding a fall of nearly 20 per in the London market price, he received an increased numb rupees for his produce. Since 1895 the planter has not only h face still lower markets, but has received a less number of r for his local expenditure, in proportion to the rise in exc which has taken place; and although the fall in the London pric only about 6 per cent., the fall in the remitting power amounte figure approaching 20 per cent. What is true of Tea is, of course of all Indian produce. Everything that has to be raised in Ind Ceylon and sold abroad is injuriously affected in precisely the way as Tea. China is not handicapped in this way, for the Ch Government has not yet either adopted the gold standard, o ployed methods for giving a fictitious value to the dollar. Sil China, therefore, is regulated by natural laws, and hence w industry is rapidly prospering in places where the benef European administration are experienced. Practically, India a present time, when the rupee is but a little under 1*s.* 4*d.* o money, gets only about 15 rupees for the sovereign for whic sells a commodity. Whereas a piece of silver, if current in Chi exactly the same weight and fineness as the Indian rupee, wou worth only $10\frac{1}{2}$*d.* Consequently the sovereign obtained, let us for China Tea exchanges for $22\frac{6}{7}$ silver pieces exactly equivale

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

he rupee in weight and fineness. The difference between 15 and 2$\frac{26}{7}$ is about 50 per cent. In other words, the gold which the Chinese rader obtains in Europe by the sale of his goods, returns in silver oin about 50 per cent. in excess of what it does in India and Ceylon. Hitherto, fortunately for Indian traders, the Chinese have not been ble to avail themselves of the advantage they have over their ndian competitors. But the whole of Europe is now scrambling ot only for railway, banking, and other concessions, but for erritorial possessions and for trading privileges. Is it not possible hat, before long, European skill and capital will be applied to the reation in China of the industries which have made such strides of ate in India? Already machinery has been sent out, with instructions to endeavour to improve the quality of China Tea, and to make t more resemble the better qualities of Indian and Ceylon Tea, and ve take the following extract from the Consular Report just issued on the "Trade of Shanghai for the year 1897":—

"An interesting incident in the past season was the experimental use at Wenchow of a Machine Roller, which proved beyond doubt that the most ordinary China Tea is capable of astonishing improvements if treated by modern methods. Wenchow Tea made by the old native process is of the most inferior description, but by being carefully made and machine rolled a very fair drinkable tea resulted."

We ourselves hold that it is no more possible to make China Tea resemble Indian and Ceylon Tea than to make Darjeeling-flavoured Tea in Sylhet, or Dimbula-flavoured Tea in the Galle District. We have no liking for the China-produced article, but that is no reason why the point of the above extract should not be watched, as the displacement of China Tea in the past has been largely due to its inferior quality. China is a larger country than India—has varieties of soil and climate. It is difficult, therefore, to say what article cannot be produced. Suppose that, just as India created a Tea industry in competition with China, China should now, under European guidance, create a jute and an indigo and a grain industry. What would become of all those industries in India, handicapped as they are by a currency which gives the Chinese competitor so great an advantage. In a short time China will be provided with better means of communication with the rest of the world. If European skill and capital are applied, not only to producing all the things which China is capable of growing, but also to the manufacturing, say, of cotton, what will become of the competing industries in India, and what will be the effect, not only upon the mass of the population, but upon the revenues? A great depression of the industries, it need hardly be said, would very seriously reduce the tax-paying capabilities of all persons engaged in them.

The question of exchange is thus a most vital one for the Tea producer of India and Ceylon, and when agitating for his grievances to be remedied he should draw attention to the vast amount of good that the industries have done in the past by opening up what would otherwise be waste land, and thus giving employment to about 1,000,000 of natives. He should point out the fact that the £35,000,000, which are estimated as having been laid out, was attracted in the belief that the enterprise would never be unfairly handicapped by the Government of the country; and that during the last year further extensions of cultivation have been greatly curtailed by the distrust created in the management of the monetary affairs of the country. The Indian and Ceylon Tea producer does not, however, feel the whole of the disadvantage in which he is placed against his rivals by the disparity in the silver exchange, as China Tea has to bear certain internal and export duties; besides which there is some slight loss in converting "silver" into "copper cash," in which part of the producing charges are paid in that country.

New Markets.—It is beyond question that the fall in the average price of Tea is due primarily to the fact of supplies being in excess of demand. Owing to the amount of land planted during the last three or four years that will be coming into bearing, this state of things may continue for a time. Thus the only course open to producers is to turn their attention to new outlets. Before going further into this point let us see what has been done in the past. . . . . The actual increase in the use of British-grown Tea is distinctly satisfactory so far as it goes, but in face of further increases in supplies, and the small margin of profit left to the producer, the demand will have to be made to continue, if possible, without further concessions in prices. Both the Indian and Ceylon Tea Associations are doing good work in opening up new markets, but they will require more support from the planters, as their difficulties are increasing instead of diminishing. The chief difficulty is again the fictitious value at which the wage paying rupee is kept. It is in the endeavour to open up the important markets of Russia and America, representing some 150,000,000 to 200,000,000lb. of Tea annually, that the difference in Exchange tells so severely in favour of the China article. The sympathies of the consumers of Tea in the United Kingdom have naturally been with their own kith and kin producing the article in their own Colonies; but there is no such sympathy with British-grown Tea in many other countries. Consequently, in foreign markets, Ceylon and Indian Teas have to rely entirely on their merits. We have in many previous circulars pointed out where new markets are to be obtained, and in conclusion we desire to impress upon all interested in producing British-grown Tea the necessity of keeping up the quality of their produce, and substantially helping the movements made towards the extension of new markets.

INDIAN CURRENCY COMMITTEE.

Statement by G. L. Acworth,
Late Chairman, United Planters' Association of South India.

Mr. Chairman and Gentlemen,—In coming before you as the representative of the United Planters' Association of South India, I would most earnestly ask you to remember that I do not merely represent the European planter of tea, coffee, cinchona, or whatever product European enterprise may be engaged in developing, but I speak also in the interests of the whole mass of native producers, the scores of millions who are unable to make their voices heard, who are really the backbone of the Great Empire of India, and on whom the prosperity of that Empire depends.

From the letter of the Chairman of the U.P.A.S.I. to the Secretary to the Government of India, Finance and Commerce Department, dated 14th February, 1898, and published in the Blue Book containing the proposals of the Government of India, you will have observed that we producers are strongly opposed to the rupee being fixed at so high a rate as 1/4, our reason being that it handicaps us so heavily in our competition with other silver-using countries as to ensure the extinction of our various industries. With the price of silver at 26*d.* per ounce, whilst the rupee is forced to 1/4, we have a duty imposed on our produce of not less than 40 per cent., or, to put it in another way, the produce of all silver standard countries coming into competition with our own produce receives a bonus equivalent to 40 per cent. In these days of keen competition and narrow margins, it is hopeless to suppose that any enterprise so heavily handicapped can exist.

That these are not idle words the destruction of the Sugar Industry in the West Indies is a proof, for it has been the competition of bounty-fed beet, which has crushed that industry, and not the superior merits of beet sugar, which is well known to be inferior to that raised from cane.

India is essentially a producing and exporting country, and it is by her exports that she must live and thrive. Tea, coffee, cotton, jute, cinchona, wheat, pepper, hides and seeds are some of her most important products, and all these come into competition with such countries as China, Japan, Brazil, and the Central States of America, where the standard is either a silver one, or practically a silver one, as in the case of Japan and Brazil.

The Government of India, in reply to a memorandum from the Darjeeling Planters' Association on the subject of exchange, stated:

"That a country as a whole makes no gain in its international trade "by a depreciation of its standard, the higher prices received for ex-"ports being balanced by those of imports."

This argument, however, holds good only on the assumption that the value of the Import Trade of India is as great as that of the Export, whilst a reference to statistics will at once prove that both in volume and value the Export far exceeds the Import Trade.

Further, the value of the Export Trade politically, quite apart from its intrinsic value, is of vital importance to the Empire. The over-population of many of the districts in India is a problem, which, even now, causes the gravest anxiety to the Government of India. To a certain extent, local manufacturers and the growth of produce for export, such as coffee, tea, cotton, wheat, jute, &c., have been a relief to the congested districts. Cut off these outlets (and who can doubt but the imposition of a 40 per cent. duty will slowly but surely crush the producing exporter), and the problem of the congested districts, with their inevitable poverty and the

discontent and disaffection attendant thereon, will be a difficulty greater than any the Government of India has yet faced.

It must never be forgotten that the ryots, the most numerous class in India, the chief payers of revenue to Government, are quite independent of Imports, and can satisfy their wants, as they did formerly, from local produce.

I would respectfully maintain that the first duty of Government is the happiness and welfare of the greatest number of its citizens. In India the greatest number, by scores of millions, are the producing classes, and it is these whose very means of existence are in danger of being wrecked.

I would further observe that the strangling of the Export Trade of India will be equally fatal to the importer, as it is solely by Exports that Imports are paid for.

Hitherto the decline in the value of the rupee has not fallen heavily on the consumer of imported goods, as a comparison of prices in 1875 and 1892, respectively, will prove. In the latter year, oilman stores, wearing apparel, cotton goods, coal, and metals of all kinds were as cheap or cheaper than in 1875, whilst curiously enough, steel rails were in 1892 cheaper by Rs.13 per ton than iron rails were in 1875.

From the point of view, therefore, of both Exporter and Importer, there is nothing to be said in favour of the artificial enhancement of the value of the rupee, whilst the argument of the Government of India that the extra price received for exports goes to pay for imports falls to the ground.

The Government of India, in reply to the Darjeeling Planters' Association, further asserts that the producer makes a temporary and unfair gain at the expense of his employés and others, to whom he makes fixed payments, also that this gain cannot be permanent, but is counterbalanced by the tendency to over-production, consequent reaction and depression, and a liability to sudden falls and rises in prices, all resulting from the want of a common standard of value between two countries.

The answer to the argument, that producers make an unfair gain at the expense of their employés, is found in the Planters' checkrolls and pay sheets kept over a long series of years. We are now in South India paying a slightly higher wage than was the case when I first went to the country, some twenty years since, whilst the purchasing power of the rupee for common country grains, such as are used by our labourers, is as great as ever, and enables them working five days a week, to lay by a full fifty per cent. of their income. This is the case, notwithstanding the fact that tea has fallen in value during that time pretty nearly one-half, and has now touched so low a point, that, with a high rate of exchange, it could not be profitably cultivated.

The argument as to over-production seems to me so forced as hardly to require an answer. So long as there is a demand for an article and it can be profitably produced, it will be produced. When profits disappear, matters will gradually right themselves by a decline in the production, until such time as the demand exceeds the supply and the profitable point is again touched, when production will be once more stimulated. Nobody but the producer suffers by a fall in values, whilst such a fall is of enormous benefit to the consumers, who are by far the greater number, and I again assert that it is the welfare of the greater number that should be studied by the Government of India in common with all other well-conducted Governments. For instance, everybody must agree that the decline in the value of tea and cinchona, respectively, has been of immense benefit to the public, whilst nobody can contend that the present high price of wheat and the consequent rise in the value of the quartern loaf from 4*d.* to 7*d.* is anything but a disaster to all but Farmers and Landlords.

Owing to the increase of labour and capital throughout the world, and moreover to the modern means of rapid transport, the over-production of certain classes of goods is almost a necessity, and I maintain that the gradual depreciation of the standard of India of late years has been a distinct advantage to her, in that it has enabled her to exist as an exporter during a time of over-production throughout the world of almost all the commodities in which she deals. Had not this been the case, the position of the Government of India would at this moment be desperate.

The Government of India further contended in its reply to the Darjeeling Planters that the adoption of a single standard of value for England and India would place China and other silver-using countries at a disadvantage. Such a statement almost takes away one's breath. It is certainly not the opinion of experts. The Madras Chamber of Commerce states, "that the Indian producers will be he handicapped in competing with silver-using countries by a 1/4 rupee." In China itself the merchants are alive enough to advantages accruing to them from the proposed legislation in I and the Foochow Tea Improvement Company lay stress i prospectus on the fact, that "China now has an advantage over and Ceylon in cheap silver," but understates that advantage it places it, as it does, at 25 per cent., for, with a rupee at 1/4 silver at 26*d.* per ounce, the gain to China is more like 40 per c

The Ceylon Silver Currency Commission of 1894 states in its re

"The class which produces commodities for export other "tea appears to have augmented its business in a very no "degree. The value of the exports has more than doubled (meas "in rupees) in the last fifteen years, measured in gold the incre "is 60 per cent.

"We are of opinion that the low price of silver has stimul the production of many commodities."

Further on, in reference to Tea, the staple of the Island, the mission reports: "The real capital value of estates must depe "their profit-yielding capacity, and if that capacity has been r "tained owing to low exchange, the owner, though he might n "able to get the same sterling price originally paid on purch "the estate when the rupee was high, is indebted to low exch "for having counterbalanced the fall on the sterling value o "produce, which would otherwise render his property profitless "possibly valueless." The same Commission in paragrap "continues: "Our opinion is that up to the present time a bu "silver currency, coupled with a falling rate of Exchange, has "for the benefit of the greatest number, and, as far as we ca "the action of the Government of India is not advantageous t "general interests of Ceylon."

Substitute India for Ceylon, for the situation in the two coun is identical. Both are affected in a similar manner by the closi the mints, and both will be similarly affected by the proposed lation. The action of the Government of India is therefore advantageous to the general interests of India.

I think I have said enough to show that the trade of India Ceylon will be anything but stimulated in its competition with silver standard countries.

To sum up: The Government of India contends in its reply t Darjeeling Planters' Association:

1. That international trade must be considered as a whole.
2. That trade and production are extended by everything adds to the welfare of the country at large.
3. That illegitimate and temporary gain by one section o community at the expense of another can only prove injurious i long run.

I am fully in accord with this summing up, with the follo qualification:—

1. International trade must be considered as a whole, but the first duty of every Government to so legislate that the cou it governs may derive the greatest possible benefit from its tra its exchange with, or in competition with, other countries. proposed policy of the Government of India is in direct contradi to this law.

2. Trade and production are extended by everything that to the welfare of the country at large. With this I also agree I contend that the community at large consists not of a few sal officials, nor even of the Europeans, whatever their occupation, are really strangers in a strange land, whose object is to acqu competency out of the country, in which they are exotics, and, ha acquired it, to retire therewith to their own land. I assert, a would do so with all the emphasis in my power, that the commu at large in India consists of the millions on millions of produ not merely whose comfort, but whose very existence almost, stake. If this proposed legislation is carried through, the time come,—it will of course take time—when the result will throug the length and breadth of India be felt disastrously in every vil Gradually it will come to the understanding of the villager, f will be taught him by the agitators, of whom even in India the no lack, and who will be quick to seize the opportunity, that additional poverty and misery are due to the falseness of the In Government, which has at last committed an act of breach of f and gone back on a word once held to be sacred. It is the In Government, he will be taught, which has made his fields productive; which has stopped the periodical visits of the middle who used to purchase the surplus of his small crops; which

made it useless to send the bullock's hide roughly dried to the neighbouring market for sale; which has reduced the output of the oil mill, for there is nobody to buy the surplus oil. Discontent and disaffection will most surely result, and such disaffection amongst the whole producing population of India is a far more serious matter than the revolt of an army.

This will of course take time, all great economic changes do, but the time will as surely come as that this Commission is now sitting.

3. Illegitimate and temporary gain by one section of the community at the expense of another can only prove injurious in the long run.

Quite so. Again I agree with the Government of India, and once more I say that it is that Government which makes the illicit and temporary gain. To artificially raise the value of a currency, which has existed and served its purpose for ages, in order to relieve its own embarrassments, can only be described as most illegitimate, and moreover the Government itself, with all its staff of officials, from the Viceroy to the lowest grade European police officers, is the merest fraction of a section of the community—they probably do not amount to one per cent. of the population. The Government will of course gain, but its gain can only be temporary. The export trade, the backbone of the country, must diminish, and, as it gradually diminishes, the capacity of the population to pay its taxes will decrease. With the dwindling of exports, the import trade will decline, for it has been proved, though it is almost too self-evident a fact to require proof, that imports increase *pari passu* with exports. By the decrease of this trade another important source of revenue will be cut off, and the last state of the Government of India will be worse than the first.

The obligation of that Government to remit annually between £16,000,000 and £17,000,000 sterling will remain. This remittance should take place in exported produce, but, speaking as a producer myself, I am confident that this trade will not continue on its present scale, and there will be an insufficient balance to meet the drafts of the Council.

There is nothing to warrant the assumption, held by some, that the present volume of the export trade will continue under the 1/4 rupee basis. The average rate of exchange for

1894-95 was 13·1*d.*
1895-96 „ 13·698.
1896-97 „ 14·45.

These were the rates for the past three years since the closing of the mints, and it is only comparatively recently that we have seen a 16*d.* rupee. It is, therefore, premature to conclude that the volume of the export trade will continue at its present level, for there is no experience to justify such a conclusion, whilst the opinion of the whole body of producers is against it.

The producer knows his business, he knows from actual experience that the present artificial value of the rupee imposes on him an income-tax bigger than has yet in the history of the world been placed on any one class of men.

It will of course take time to test this question of exports, as many a producer, who has this capital so invested as to be unable to shift it from one product to another, even were another product available, will struggle on and pledge such credit as he has in the hope of things righting themselves, in my opinion vainly so, and I for my part have no intention of fighting the inevitable, or throwing away good money after bad. The moment the proceeds of my produce are insufficient to cover my expenses, I shall abandon my estates with all their valuable plant and machinery, the fruit of twenty years' patient work, whilst five hundred labourers will be thrown out of employ. Doubtless many others, unwilling to incur a hopeless debt, will adopt this policy, and in this way the beginning of the end for the producers will come.

I think I have now said enough to justify the opinion of the producer that an artificial rupee is against the interests of the Indian Empire, as also detrimental to the welfare of the greatest number.

It only remains to suggest a remedy. My Association strongly urges the re-opening of the mints, and allowing the rupee to fall or rise with the value of silver.

We are quite aware that violent fluctuations in the value of the rupee are most prejudicial to mercantile transactions, but we are of opinion that, when once the Government of India has declared its determination to re-open the mints and to abide by that decision, though the rupee will fall heavily, until it has reached its true level, the fluctuations thereafter will not be violent, in fact no more violent than the fluctuations of the silver market, by which the rupee is, or rather ought to be, controlled. We further believe that speculation would be reduced to a minimum.

We are fully aware that a rupee so low as 10*d.*, 11*d.*, or even 1/- entails great losses to the Indian Government in its remittances, but we are prepared to do our part and assist the Government in meeting those losses.

With a rupee at 11*d.* the loss to the Indian Government is estimated by the Secretary of State at fifteen crores. Other authorities place it considerably lower, but let us grant that it is that sum.

A part of this loss is already covered by taxation, and it is, therefore, unnecessary to consider it.

The balance of the loss, whatever it may be, we producers are prepared to pay by having an export duty (not larger than the amount necessary to cover it) placed on our produce, provided —

(1) That should the rupee rise in value, or the export trade increase, which it almost certainly would, the duty should be proportionately reduced.

(2) That the exports of Ceylon should be taxed to a like extent.

No doubt Ceylon producers would oppose such a measure and would justly argue that their Government is not in want of funds. It is, however, only fair that our brethren in the island competing with us in India should be placed on the same basis as ourselves. But I would suggest that, should this tax be imposed in Ceylon, it should be utilized for the benefit of the planters, either

(1) By developing the railway system in the Island or
(2) By the entire removal of medical and road cesses, or
(3) That the proceeds of the tax should be handed over to the Ceylon Planters' Association for the purpose of pushing the consumption of Ceylon Tea and other products throughout the world.

Our brethren in Ceylon must bear in mind that the Indian Government must pay its way, and they should be prepared to allow us to assist that Government, and by reaping no unfair advantage over us through our misfortunes to cheerfully bear their share of the burden. Should any one of my suggestions as to the disposal of the proceeds of the export duty in Ceylon be adopted, the indirect benefit to the producers of all classes will be great. I have now laid our case before you, but before concluding I would ask you to consider what enormous interests (quite apart from those of the Indian Government) are committed to your charge.

The value of the tea, coffee, and cinchona estates in South India alone were estimated by the South of India Planters' Enquiry Committee of 1896 to amount to 13 millions £ sterling at the present rate of exchange; the estates give employment to some 325,000 labourers, and disburse annually in wages 1¼ million £ sterling. In North India the tea industry is as large, but gives employment to half a million labourers. For Ceylon I have not the figures, but it may be safely assumed that the planting industry fully equals (if it does not exceed) that of South India.

The total value therefore of tea, coffee, cocoa, and cinchona in India and Ceylon together must amount to fully 40 millions £ sterling, and must find employment for at least one million labourers; but it must never be forgotten that, great as are these, which may be classed the European industries, they are in India at any rate the merest fraction of the agriculture of the country. I repeat once more that all we Planters, who appear before you, represent not ourselves alone, the few European landholders, but that our interests are identical with the whole mass of producers; in other word, the tax-payers of the great Indian Empire.

GRANVILLE L. ACWORTH.

STATEMENT BY THOS. NORTH CHRISTIE, ESQ. (OF CEYLON).

BEING much more interested in Ceylon than in India, I should premise my statement by explaining the relevancy of Ceylon evidence to the present enquiry. Although the Indian Government in their recent despatch (3rd March, 1898) claim for their Currency policy Imperial importance and Imperial aid, and so open the question to the consideration of other than purely Indian views, there is not on the part of Ceylon any expectation that its interests could in the very least be allowed to interfere with those of India. The attitude of the Colony in this matter is that its 1893 Currency Commission (of which I was a member) cleared up issues and elicited facts which had not previously—nor have they subsequently—been investigated by any authoritative body, and that Ceylon affords a most valuable object lesson to those who desire to see what the effect of currency changes has been, and is likely to be, on the real prosperity of the people in a producing country. There is practically

no difference between Ceylon and India in this particular; the prosperity of the people in both countries depends on the remunerativeness of their agriculture, and the ability of each country to meet its home (English) charges for debt, &c., entirely hinges on a favourable balance of trade being maintained. It is true, however, that in the matter of sterling payments, the position of the Government of India is not such an easy one as that of the Government of Ceylon, and that the anxieties of the former have not been shared by the latter owing to its relatively smaller gold obligations.

In the investigation by the Committee of the probable effects of the proposed changes upon the internal trade of India, *the* issue of most far-reaching importance is whether on the whole a high or a low rate of exchange is beneficial, and the finding as regards Ceylon, after most careful investigation, was:—

"Our opinion is that up to the present time a bullion silver cur-
"rency, coupled with a falling rate of exchange, has been for the
"benefit of the greatest number—in other words, the sum of the
"advantages has preponderated over the sum of the disadvantages
"and, as far as we can see, the action of the Government of India is
"not advantageous to the general interests of Ceylon, provided—

"(*a*) That the re-adjustment of all local salaries, wages and prices
"to the altered value of the rupee could be deferred for an indefi-
nitely long time;

"(*b*) That the future rise in the general revenue would be sufficient
"to keep pace with the increase in the obligations of the Govern-
"ment consequent on the altered value of silver, such rise being
"secured either by the revenue naturally rising *pari passu* with the
"increased demands on it, or by additional contributions from the
"producing interests specially favoured by a bullion silver currency
"and low exchange."

"With reference to the possible re-adjustment of local wages and
"prices measured in silver, while we find that there is in Ceylon a
"slight tendency towards increasing wages, and a more general
"tendency towards increasing prices (after taking duly into account
"local exceptions and certain prices which have decreased), such
"increase bears no actual proportion to the progressive decline in
"the gold price of silver, and it can hardly be attributed thereto.

"It is our opinion that the date of such a general adjustment of
"wages and prices is uncertain: that it will probably be remote,
"and that it may be postponed for an indefinite period of time."

This, be it remembered, was during a period when India, Ceylon, the Straits, China, Japan, &c., were all sharing the fall, but when, as at present, the high rate of exchange is an artificial one, and partial only to India, Ceylon, and Mauritius, the crushing disadvantage to these countries where they now, or may hereafter, come in competition with silver-using countries, cannot be lightly thought of, and claims the most careful consideration. There is one rather convincing example of the benefit which a silver currency is to an industry competing against gold currency rivals, and that is the sugar production in Province Wellesley. It is the only one of England's sugar Colonies which is prosperous and not on the verge of ruin—it is the only one with a bullion silver currency.

I would most especially direct the attention of the Committee to the necessity of their examining the only attempt (so far as I know) of the Government of India to rebut the producer's belief that low exchange benefits him. It is contained in the letter of the Government to the Darjeeling Planters' Association, dated 12th October, 1892, and on that document the Government of India evidently still rely, for it is referred to in their despatch of 17th March last. The entirely erroneous premises on which the reasoning in that document is founded were exposed by the Ceylon Currency Commission, thus:

"In the reply of the Government of India to the Darjeeling
"Planters' Association in the following conclusion:—

(1) "That a country, as a whole, makes no gain in international
"trade by depreciation of its standard, since the extra price received
"for its exports is balanced by the extra price paid for its imports.

"This conclusion appears to us to involve two assumptions of
"fact, neither of which is true respecting either India or Ceylon.

"It assumes (untruly) that the commodities exported and the
"commodities imported exactly balance each other in value.

"In both countries the exports largely exceed in value the imports,
"leaving a surplus in favour of the country which is paid in bullion
"(either gold or silver) at the option of the country entitled thereto.

"In India the surplus imported in bullion is shown at page 239.
"It has risen from an average of Rx.5,394,897, from 1870—75 to
"Rx.14,099,390, for 1890—92.

"The argument of the Government of India would regard
"last surplus as no more profitable than the first, or indeed a
"more profitable than no surplus at all."

"It assumes (untruly) that the standard of each other co
"with which the country trades is identical."

"That is not the case with regard to India or Ceylon; the t
"of both is shared between countries with a gold standard
"countries with a silver standard."

Even had the position of India's trade been as was (wron assumed, the reasoning would still be unsound, for it takes no of the benefit which accrues by a producer exporting more and sp ing the full amount of his increased income on imports. Fur the reasoning that any benefit derived by anyone from a currency change can only be at the expense of another member o same community would, if true, apply equally to the benefit w the Government of India expected to get by their currency manœu And still further, the argument that the gain is not permanent is counterbalanced by a tendency to over-production and conseq re-action would apply with equal force to a rise in market pr and would condemn as illusory the benefits which the credu producer has hitherto imagined he derived from many of the de of mankind to cheapen production and land and sea transp Additional profit of course means additional production, and tha its turn, means lower prices, but it is the action of an all-round and not one singular to exchange benefits.

The value of Ceylon as an object lesson in this matter is th presents, in a compact and reliable form, an index of the resul high and low, natural and artificial, exchanges, undisturbed by famine or plague. The prosperity of all classes in Ceylon stea advanced with falling exchange, and with the artificial rise scarcity of currency came a great check; the margin of profit most seriously gone down, in some cases disappeared, and the I rate has stood for months at 12 to 15 per cent. The price of tea staple product, has gone down, and verified the prediction of the Currency Commission:

"The effect of this exchange premium in China's favour w
"therefore be manifested less by any remarkable increase in
"export of China tea or displacement of Ceylon tea, than b
"prolonged reduction in the price of tea to a figure which
"so low as to prevent Chinese growers, even with a premium of,
"1½*d.* or 2*d.* per lb. in their favour, exporting with profit."

Had Ceylon been competing during the last few years on currency terms with China and Japan, it would undoubtedly displaced the teas of these rival countries to the extent of a many millions of lb. in the American, Russian and other mark and, as a consequence, the English market would have been reli of the over-supply which has depressed it. Up to the time when artificial value of the rupee rose considerably above the lowest p which it had reached when a bullion coin, and the scarcity Currency became acute, every index of a people's prosperity un takably showed the advancing welfare of all classes in the Colo since then the turn has taken place, prosperity has waned, Europeans and natives alike feel the baneful effects of the pre Currency position. I draw precisely the same deduction from Indian statistics—they showed a steady and great increase in prosperity of the people, in their purchasing power and in t accumulating capital. The later figures tell a different tale, distorted as they must have been by the influences of plague famine, it is impossible to attribute the decline solely to the state o Currency, although it must have been a potent adverse factor. only do the statistics relating more particularly to the people te the steady advance under low exchange, but the facts and fig connected with the Government's finances bear witness to the conclusion. In spite of the great decline in the opium revenue the much increased rupee charge for sterling payments, the Fin Minister in his last statement was able to show that during twenty years (1878—1898) the revenue had exceeded the ordi expenditure by Rx.50,998,294, and he declared, "The record of tw years' finance which I have displayed in the above figures is a b one than can be shown by almost any country in the world bu United Kingdom." The prosperity of the people was reflected i expansion of Revenue, for there has practically been no increa the rates of taxation except those imposed after 1886 to make u the remissions of 1882. It is evident, too, from the above state that the embarrassments of the Government of India due to exchange had been greatly exaggerated. In this connection, it

be well to draw attention to the erroneous way in which the Government of India's loss by exchange is commonly thought and talked of. The par value of a remittance is taken, and the difference between it and the rupee sum actually required is "loss of exchange," or the rupee cost of India's sterling remittances in a given year as contrasted with the rupee cost in a subsequent year and the difference is "increased loss by exchange." India has of course often increased its debt, and with increased debt, apart from exchange, larger payments have to be made. I notice that the permanent debt in England, which was £73,000,000 in 1886, has gone up to £113,000,000 in 1886, and the difference has been raised at an average probably under 1/4 per rupee. The gain on capital on such portions of the debt is quite equal to the proportionate loss on the annual interest, and enabled a smaller loan to construct a given railway or irrigation work. I notice that Sir J. Westland quotes the extra exchange loss on the railway debt as it stood in 1878 at Rx.1,000,000.

Stability of exchange has had very great importance attached to it, and the Secretary of State for India said lately:

"If we could ever establish a gold standard in India, fixing the 'stable exchange of the rupee at 16*d*., subject only to the fluctuations 'of trade, the advantage to India would be enormous. At the 'present moment the great industries of tea, and indigo, and jute, 'are carried on to a large extent by borrowed money, and in India 'money can only be borrowed at from 6 to 10 per cent. On the other 'hand, if you can secure anything like a stable exchange, you would 'have all the hoarded capital in this country waiting for employ-'ment, ready to be used in developing the resources of India."

But I submit there is in this utterance a great misapprehension of what is the real magnet that attracts capital. It is the reasonable prospect of profit which causes the flow of capital, and stability of exchange *per se* comes as a very minor factor. For instance, we have perfect stability of exchange with the West Indies, but no British capital—other than the Government doles—is going there; nor has the stable exchange with Australia, Newfoundland, or Fiji, sent British capital to these countries for some time past; on the other hand, the unstable exchange with Ceylon has not in the least checked the flow of capital to it. After examining witnesses of all classes, the Ceylon Currency Commission reported:

"The evidence we have is conclusive that that fall has not prevent-'ed the introduction of all necessary English capital, and it is stated 'that there is more capital offering for investment on reasonable 'terms than has ever been the case before. There is no practical or 'legal difficulty in securing the repayment of sterling loans in 'sterling value, and the loans of English capital, almost entirely 'made to Europeans, are so secured (see Appendix D, 13). Native 'borrowers and lenders deal entirely in rupees, and have been in 'this respect unaffected by the fluctuations of exchange."

Stable exchange, if other things remained equal, is an encouragement to the free movement of capital, but it is not a condition that is worth achieving at the cost of restricted currency and diminished prosperity. It would be a convenience to many, and tend to assure profit to those financial houses—private firms and public companies—who can borrow money at low rates in England and lend it at high rates in the East. The increase of local capital, to which the mints were so favourable, and the maintenance of whatever exchange conditions are found to be best for the producers, would seem preferable to driving the people to borrow from foreign lenders. It must always be remembered that many of those whose voices are heard loudest in expatiating on the advantages of a stable exchange, are, in reality, nothing for stable exchange *per se*, but regard it solely as a hopeful means towards securing their end, which is an artificial rate very much above the natural rate. Similarly, with those who, like myself, oppose it, it is not the abstract stable rate which is opposed, but the knowledge that behind it comes what at present would probably be a 50 or 60 per cent. artificial appreciation, and the possibility that this crushing handicap on Indian and Ceylon products in competition with those of the far East might be further increased. On the merits of the scheme, as a sound or unsound currency proposal, now before the Committee, I can only offer a mere amateur opinion, but it seems to be a reversal of the usually accepted duties of a Government to its people in currency matters; and a denial of a sufficiency for local trade requirements of the only legal tender, in order that it may acquire an outside scarcity value, is a sad come-down from the stand-point of the Indian Government as disclosed in a State paper bearing date October, 1876, in which it was laid down that to evade the consequences of lower exchange by raising the value of the standard unit of value would be "an especially vicious form of class taxation," and "an expedient quite inadmissible."

The present scheme is apparently that of Sir David Barbour, as laid down in his minute of 21st June, 1892, but it omits one essential of the scheme then propounded, viz., that "they (the rupees) must "be convertible into gold coins either without payment of premium "or on payment of a trifling premium whenever any person wishes "for gold coins in exchange for silver coins." If an effective gold standard can be introduced into an Empire like that of India in such a simple manner as is now suggested at almost no apparent cost at all, it is strange that other countries, Russia for instance, should have required many millions of gold to achieve the same end.

If achieved in India in the manner now suggested, the real cost would, I believe, soon be apparent in the strangulation of trade and diminution, if not extinction, of the favourable balance. I do not question that, as the Indian Government states, "redundancy is a relative term," but I submit that the standard should be the needs of the people, and not that necessary to give a coin a scarcity value in foreign eyes.

So far as the needs of commerce and the people go, there is far from being a redundancy even at present, before the destruction of the currency medium has commenced.

It is much more easy to criticise than to suggest, and I am unable to propose any alternative scheme which I consider satisfactory. The least unsatisfactory plan would be, I think, to re-open the mints with a rather heavy seignorage and the imposition of an import duty on silver to about the same amount per rupee. If the whole of the artificial value be placed on the seignorage, the temptations to illicit coining will remain very great, and, on the other hand, if it were all placed in an import duty, the value of silver in the country would be raised too much, and probably for some time to come there would be little outside silver imported, and consequently the revenue to Government would be small.

The unqualified re-opening of the mints is what one would like to be able to recommend, but although strongly opposed to their closure, I consider that a sudden drop in the rupee to bullion value, even allowing that silver would at once rise somewhat, would be too revolutionary, and it would leave the Government in a position of anxiety as regards their sterling payments. I may say, however, that I would prefer to see the mints re-opened without qualifications, and bear the cyclonic disturbance which would result, rather than continue the present wholly intolerable position.

THOS. NORTH CHRISTIE.

18*th June*, 1898.

STATEMENT BY H. P. HODGSON,
Planting Member of the Legislative Council of Madras.

MR. CHAIRMAN AND GENTLEMEN,—Before placing my views on the Currency question before you, I will premise my statements by explaining that I in no way claim to be an authority on a subject so intricate as that of International Currency, my only claims for being heard at all being, firstly, that I have the honour to represent the Planters of Southern India on the Legislative Council of Madras, and secondly, that I have had an experience extending over 25 years as a planter in India, during which time I have been a grower of produce for export, the value being paid me in gold, whilst the cost of production has been paid for in silver. As a planter, therefore, I maintain that one is brought into practical contact with the effect of the exchanges on agricultural industries. His labour being drawn entirely from the agricultural classes, the planter is brought into very close touch with them and their necessities, and their ways and means of livelihood.

In following the working of the currency policy of the Government of India since the adoption of the proposals of the Herschell Committee in 1893, which I have done with much interest as affecting my business, it has always occurred to me that the main questions as to the desirability of changing the currency from silver to gold, either with a gold currency or a gold standard, would some day have to be considered, and should have been considered before the somewhat hasty adoption of the Herschell scheme (as I may call it) instead of afterwards.

These main questions as they suggest themselves to me are:—

I. Did the trade and agricultural interests in India require, or call for, a change in currency?

II. Is a gold currency, or standard, the one best suited to the

conditions and requirements of India, the country which would have to pay for it?

III. If so, is the Herschell system, namely the system of raising the value of the rupee by creating a scarcity or retraction of the coinage with a view to raising it to a fixed point and then substituting a gold standard, the best one to introduce it?

IV. If so, is 16*d.* per rupee the best rate at which to fix the value?

V. If questions Nos. 1 and 2 are decided in the negative, what is now the best thing to do?

These questions appear to me to embrace the chief points on which the present enquiry into the future currency policy of India should turn, so far as the interests of agriculture aud commerce are concerned. I say advisedly the agricultural and commercial interests apart from the interests and liabilities of the Government, for I maintain that the currency should be fixed for the welfare of the people, and not for the necessities of the Government, the revenues which the latter have to control being entirely dependent upon the prosperity of the former.

This principle was admitted by the Government of India in a letter to the Secretary of State for India, dated Simla, 13th October, 1876, No. 368, Financial, in the following distinct terms:—

"It is especially important to observe that the State would have no right to change or enhance the standard unit of value, either for the benefit of the public revenues or of any class or classes of the community, however influential or valuable, on any ground whatever other than that the relations of the whole community were so disturbed by the alteration of the value of the standard that the common weal required its readjustment."

I. Did the trade and agricultural interests in India require or call for a change in currency?

In considering this question, it will be necessary to go back to a time previous to the appointment of the Herschell Committee to see how the alteration in the views of Government in this respect came about, and from whence came the first agitation for a change in the currency. Such a question is, I think, legitimate at this stage of the enquiry when the result of five years' working of the Herschell scheme has brought down universal condemnation from all classes whose existence depends upon a sound currency policy, and has left the present Government of India alone in supporting it. I think it will be admitted that the first real agitation for a remedy in the steady fall in exchange was made by the Government officials in India, who (doubtless with reason) complained that they were heavy losers by it, and ought to be compensated. This agitation was continuous and widespread, and I think that to it may be attributed the first step towards the consideration of a fixed rupee at an artificial value.

The next move was with the Government of India (coming from the same class) who saw in a fixed rupee, artificially raised in value, a means of meeting the heavy sterling liabilities yearly increasing by the falling rupee. Eventually no doubt some representatives of the banking and commercial interests joined in advocating a trial of the proposed scheme, caught perhaps with the idea of a fixed rupee facilitating business and minimising the risks. The producers from the first declaimed against the Herschell scheme, on the ground that an artificial rupee would place them at a disadvantage with other silver countries having a natural exchange.

Thus I would trace the origin of the Herschell Committee to the members of the Indian Government, supported afterwards by some of the banking and commercial representatives, but always opposed by the representatives of the producers. I think this retrospect may be excused when it is considered in connection with the present situation, which is, that the members of the present Indian Government continue to approve the working of the Herschell scheme and advocate an extension of its principles, while the whole of the banking and commercial representatives have unanimously declared that the present position of the money market in India (the direct result of the working of this scheme) is intolerable, and fraught with the greatest danger to their prosperity, and the agricultural representatives of India, joined by Ceylon, remain staunch to their original contentions, fortified by the sad experience of the trial, and declare that a continuation of the present currency policy must involve them in extinction.

II. Is a gold currency or standard the one best suited to the conditions and requirements of India, the country which would have to pay for it?

To this, as far as my experience goes, I should certainly reply in the negative, for the following reasons:—(*a*) Because unles urgently called for by the unanimous voice of the banking, co cial, agricultural and industrial representatives of the people, c (which might be termed volcanic) in the old-established coina country, especially a country with a vast population of uned and ignorant people of an alien race, may be attended with dangers to the commerce, industries, and agricultural interes to that settled feeling of confidence which it is so necess maintain in a country like England. (*b*) That the adoption of standard would necessitate the fixing of the value of the rupee, would still be the medium of exchange and payment in Indi would place all producers permanently at the disadvantage o we now complain, amounting to the difference between India' value and the natural value of silver, with all countries using at a natural exchange and with which our goods come into tition.

But although a gold standard might be established without currency, the want of a bullion backing would soon be felt, again quote from a previous utterance of the Government of such a state of things could not be tolerated permanentl should an enhanced standard be established, it would be imp to indefinitely escape the obligation to introduce an en currency.

If a gold currency could be established, which I believe beyond the resources of the Government of India, it could o maintained with difficulty, and at great expense, as the absorption by hoarding (which would then be done in gold ins in silver as now) would be so great as to materially affect the sary volume of floating coinage.

Again, to establish a gold currency in India would only t further appreciate gold, and it is more than probable that India is suffering from now is appreciation of gold rathe depreciation of silver. This would tend to still further wid difference between the gold legal tender coin, which would chi used in exchanges out of the country, and to depreciate the legal tender, which would continue to be the one used by the to the loss of the latter.

III. If so, is the Herschell system, *i.e.*, the system of raisi rupee by creating a scarcity or retraction of the coinage with to raising it to a fixed point and then substituting a gold sta the best one for introducing it?

This question brings up one of the most important indict against the Herschell scheme, and one in which all classes agree.

It is found that through the contraction of the currency, five years' application of the Herschell scheme has brought money has become so scarce as to practically interfere with bu and the price of money had become so high that for some r before I left India, in May of this year, bank rates were nor 12 to 15 per cent., but practically money could not be got than 15 to 16 per cent. on Government paper or gold bars. speaking of commercial money, but money for agricultural pu was not to be had at any price. Some of the members Commission must be aware that the whole of the agric production of India is carried on under a system of adv However objectionable such a system may be in principle, it it is older than the British rule, and will not be altered. field and almost every growing crop has money advanced u the rates of interest on such loans always being high, and from 20 to 73 per cent., the latter being a common rate of i for loans for short periods on growing crops. The ryot mus the money usually to buy grain to show is fields, and unless it the ground remains fallow. I know that of late the ra interest have been raised by the native money-lenders, and in cases the loans are refused, either case bringing povert desolation to the ryot. This state of affairs is due to the s and dearness of money. The native money-lenders in many get their money from the banks, on security of Government or produce, and lend it out in small sums. These men cann money from the banks now as they could, and the result in co time will be a deplorable loss to the native agriculturalist.

Cheap money, and plenty of it, is what makes the prospe any country, but the Herschell scheme seeks to raise the va the medium of exchange, the rupee, by creating a scarcity of which means poverty in plain English; in fact, without such city, the artificial value cannot be maintained under this sche

The principle is suicidal to the prosperity of the people, and

not be permitted for a moment in any country where they are sufficiently educated and advanced to have a real voice in the government and administration of their country. In fact, the aim and object of the Herschell scheme is to bring about the balance of the revenue by a form of taxation which is condemned in no measured terms in a letter of the Government of India of the 13th of October, 1876, which I have before alluded to and will again quote from :—

"An addition to the liabilities of India arising from an increase in the value of gold, so far as it affects the State, can be legitimately met only by an equivalent improvement of the account of revenue and ordinary expenditure, *i.e.*, either by an increase in the revenue or a decrease in the ordinary expenditure : there is no way of avoiding this necessity. To meet any obligation thus caused by raising the value of our standard unit of value would, we conceive, be an especially vicious form of class-taxation ; for the burden of it (while virtually raising the demand of Government on those who reap the products of the soil) would fall exclusively upon the poor and indebted, the rich creditor class benefiting like the State, at the expense of the rest. We should consider this expedient inadmissible." Here is rightly shown how such a means of the standard unit of value is a vicious form of class-ta directly falling upon the agricultural classes of India.

IV. If so, is 16*d.* per rupee the best rate at which to fix the

To this I should decidedly answer, no. The difference b the actual and the artificial value of the rupee is far too wide t of profitable competition with other silver-using countrie causes too heavy a loss to the producer. That a high rate of ex would be injurious to India is admitted by the Government o in a Financial despatch to Her Majesty's Secretary of State fo No. 261, dated 16th September, 1897, from which the follow extracts :—

"In any case we are of opinion that the true interests o demand that any measure for attaining stability in the r exchange between gold and silver should be based upon a ra greatly differing from 16*d.* per rupee ; and that any measure would raise the rupee materially higher than that level i great danger for which we see no adequate compensations.

w.

One of the factors in fixing the demand of Government for revenue is the price of agricultural produce; if that price falls away the heavier the demand becomes, and if it falls away materially the relation between the price the ryot can obtain for his produce and the assessment he has to meet may be so seriously altered as to affect the agricultural prosperity of large tracts of country. . . . So also as regards our railway revenues which are now so important a portion of our income; they are in part directly dependent upon the activity of the export trade, and a blow struck at that trade will be felt by us immediately and directly through our railway account."

So here the principle is admitted that, India being a country competing in a large proportion of her produce with silver-using countries, having a natural, which means a lower exchange, would suffer from a high exchange. But the Government of India fixes, without any reason for the violation of the admitted principle, a rate of exchange of 1/4, or a difference of, say, 6*d.* between the actual and artificial value they propose to fix as a rate which will be of advantage to the country! Surely there is something inconsistent in such an unexplained contradiction. The only possible explanation that I can discover is that, at 16*d.* per rupee, the Government can balance their budget without trouble or anxiety. If this is the reason, I can only say that the principle involved is one that I cannot commend. What the Government of India practically says is: We want money by tinkering with the coinage; we can get it in a form of taxation which will not generally be recognised as such. We will arrange the exchange so that for £1's worth of produce no one shall receive more than Rs.15, although its present rupee value may be 18 or 20 rupees.

By this means, last year, a sum of no less than Rs.18,70,300 was made under the item expenditure, being the difference between the budget estimate and revised estimates under this head for 1897-98; and this was admittedly due, to quote Sir James Westland's own words, "mostly by reason of improvement in exchange."

This profit was made out of the bills purchased by exporters to cover exported produce, and comes really out of the pockets of the producers.

To justify this very manifest loss to the producer, the Government of India attempts to prove that real trade is only an exchange of goods; that the producer exports, say, £1's worth of rice or tea, and in return receive £1's worth of cotton goods or iron-cooking pots. But this is theory, and depends for any value in the argument on an even balance between exports and imports. In practice the producer sends home £1's worth of rice or tea, and does not want the £1's worth of cotton goods or cooking pots, nor has he that amount to spend on them, for in the first place he has to pay for the cost of producing his exported articles, and, secondly, may prefer to spend his sale-proceeds on articles manufactured in the country. Whether, therefore, he gets Rs.15, the artificial value, or Rs.20, the real value, makes a very material difference to him. As a matter of fact the millions of agriculturalists in India have little or no occasion to purchase imported goods, and for goods grown or manufactured in the country the purchasing power of the rupee is not affected by exchange.

I submit, therefore, in the interests of the people of India, and of producers in particular, that if it is decided to fix the value of the rupee in order to establish a gold currency or standard, it should be done something near the true value of silver.

V. If questions I. and II. are decided in the negative, what is now the best thing to do?

Herein arises a question on which I will speak with much diffidence. In the interests of the producers alone—and it must be remembered that the population of India is of this class—I have no hesitation in saying that the gradual re-opening of the mints until the rupee reaches its real silver value would produce the greatest measure of prosperity, as it would enable us to compete on even terms with other countries having a silver currency, and would ensure to us the highest price for our exports in the coin of the country in which we work, and in which coin we have to pay the whole cost of production. It would take too long, and would perhaps be out of place here, were I to go into the average percentages of profit, after paying cost of production, on certain articles grown for export, but I may say, without fear of contradiction, that the margin is too often a very small one, and in some cases the balance is the other way, and the sale-proceeds do not cover the cost. When all these costs have to be paid in silver, it does not require much explaining to show how important is the amount of silver obtained in return for the produce sold. If the re-opening of the mints is decided against and a gold standard, or coinage, advocated, I would suggest for consideration that the value of the rupee should be fixed at a much lower rate than that proposed by the Government of India. This would be a relief to the producer only second in degree to the last proposal.

I recognise the difficulties of the Government of India in meeting their sterling liabilities, and that means must be forthcoming to enable the Government to meet them, and also to provide funds for the vigorous prosecution of works for the opening up and development of the country. But after reading the statement made by Sir James Westland on presenting the last Imperial Budget, I cannot believe that there should be any very great difficulty in arranging the revenue and expenditure. The Finance Minister spoke with pride of a record for the past twenty years of finance, unequalled in the world except by the United Kingdom, and at the same time his prophecies for the future were of the most optimistic character. If further taxation, however, should be necessary, let it be a direct tax, say, on exports or imports, but let it be a legitimate tax of which the extent can be definitely understood by all, and not a tax on money, which is the first necessity of progress and prosperous trade.

Before closing my remarks, there are two points on which I would ask leave to touch briefly. First, the effect that the sudden closing of the mints to free coinage of silver has had upon the savings of the poorer classes throughout India. It has been the custom, among the poor agricultural classes especially, for ages past, to put their small savings into silver ornaments made out of rupee silver; this having been done both for safety, as they are carried about on the persons of the members of the family, and also because such ornaments were always available as negotiable securities on which money could be raised. So long as the mints were open, the value of these ornaments was gauged by their weight against rupees, into which they were readily convertible. By the closing of the mints, the rupee value of these savings was at one blow heavily cut down. In other words, the face value of the rupee is now above its bullion value, and the uncoined hoards of the natives have now at least 20 per cent. in purchasing power compared with rupees. Imagine how disastrous this must be to them in times of famine. If an account of the actual loss thus occasioned could be made up, the figures would be startling, and would, when the cause is realised by the sufferers, which is not yet the case, be a very just reason for discontent among the millions of poor affected by it.

The second point I would wish to make myself clear upon is that, in objectiug to the artificial enhancement in the value of the rupee, we are not actuated by a desire to make what the Government of India describes in a despatch replying to a letter from our Associations on the subject as "a temporary and unfair gain from depreciation of the standard." I may say that we claim to look further ahead than such a shortsighted policy would imply.

We do not fear a high exchange so long as it is a natural exchange which would affect all silver countries competing with our products. What we do fear is the strangling of our industries by other countries working with a lower natural exchange, enabling them to place their products in the markets of the world at a price which we cannot attain with the bounty we have to give them, and it is to us a certainty that this will be the end unless we get relief.

Industries other than agricultural suffer in India by high exchange, whenever the cost of producing the article paid for in silver and the product is sold for gold. In support of this statement I would illustrate the gold mining industry in Mysore, which provides a valuable instance of how the cost of production in rupees is affected by a high exchange, as the product of the mines being gold is unaffected by fluctuation in value.

The expenditure in India affected by exchange amounts to about ten millions of rupees per annum; taking the intrinsic value of the rupee to be 10*d.*, this would amount to £416,666, whereas the amount required to buy these rupees at the present artificial value of 1/4 is £666,666, or a difference of 250,000 per annum. When I say that this sum represents about 10 per cent. on the nominal capital of the companies paying it, it may be understood what the loss is to shareholders.

The Mining Board of the Colar Fielde is of itself about to lay a statement of the foregoing facts before your Commission, but in case such written evidence may not be accepted, or should arrive too late, I ask leave, as a representative of some of the companies, to embody the information in my statement.

Finally, I submit that India flourished in its trade and in the expansion of its industries with a silver currency, and with a low and falling exchange, and although the latter may have caused some

loss to a few, it brought prosperity and riches to the people, directly reflected in the brilliant financial retrospect of the last twenty years by Sir James Westland, previously referred to. Capital flowed into the country under the old system, and if there is now a stagnation of trade and a general withdrawal of capital from the country, it is due to the currency policy of the Government of India, whereby a scarcity of money has been created through the closing of the mints, and by the unhealthy enhancement of the rupee to an artificial value, causing panic to investors and bringing ruin to producers.

(Signed) H. PERCIVAL HODGSON.

INTERVIEW WITH MR. LINDSAY.

THE Calcutta correspondent of the *Pioneer* telegraphs:—I have just had a long interview with Mr. A. M. Lindsay of the Bank of Bengal, who has just returned from England after giving evidence before the Currency Commission. As the Blue Book containing the evidence given before the Commission is published in London this evening, Mr. Lindsay saw no objection to expressing his views as to the probable outcome of the Currency Commission.

Mr. Lindsay prefaced his remarks by saying that his opinion was formed solely on the enquiries made in the course of his own examination before the Commission, and may be modified when he sees the result of the evidence given by others.

Questioned first as to the possibility of bimetallism being recommended by the Currency Committee, Mr. Lindsay said: "I think it will be found that bimetallism is no longer within the range of practical politics."

"And the proposal to reopen the Mints?"

"The reopening of the Mints also, I venture to think, may be regarded as outside the sphere of practical politics, so far as the opinion of the Currency Committee is concerned."

"What support do you imagine the Government proposals are likely to meet with?"

"Sir James Westland's scheme has few or no supporters in the Committee. The idea that a gold currency can be established in India at a small expense is held only by those who have little or no experience of the conditions of Indian trade and Indian banking."

"The Government scheme meeting with no favour, and the opening of the Mints and bimetallism being both outside the pale of probable discussion, in what direction do you consider the Currency Committee is likely to carry on its deliberation?"

"There are several important points at issue—(1) In the first place there is the question whether convertibility should be adopted at once or whether, in order to give time for more mature deliberation, matters should be allowed to remain as they are for a little longer; the stringency in the money market being meanwhile relieved by temporary measures, such as increasing the Government balance with the Presidency banks.

"(2) If convertibility is adopted, ought the responsibility of the step to rest exclusively on the shoulders of the Government of India, or ought the Imperial Government to lighten the burden and increase the public confidence by giving an Imperial guarantee that convertibility will be permanent and unfailing?

"(3) What ought to be the margin (favourable to the Government) between the rate of issue and the rate of conversion? Should the margin be 2 per cent. or less?

"(4) Should the par value (or convertible value) of the rupee be fixed at 1*s.* 4*d.*, or would it be more advantageous on the whole to fix the rate at 1*s.* 3*d.*?

"(5) In the event of the Government's Gold Conversion Fund becoming exhausted by reason of a heavy demand for sovereigns in exchange for rupees, is it desirable to melt down rupees and sell the silver to supply the deficit of sovereigns?

"(6) In the event of exchange dropping to the conversion rate, should the Home charges be paid out of the Gold Conversion Fund, or should Council Bills continue to be sold on all occasions to the highest bidder?

"These six points," added Mr. Lindsay, "are of immense importance, and I am inclined to think that they will occupy a prominent place in the deliberations of the Currency Committee."

I pointed out to Mr. Lindsay that there was still the question of indefinite liability which must necessarily be incurred in connection with any scheme of free and unrestricted conversion.

"The argument of indefinite liability," he replied, "has no force, for the simple reason that it is now recognised that a still heavier and an equally indefinite liability is incurred in the absence of convertibility, and a similar indefinite liability would also ha borne if a gold currency were introduced."

This concluded the interview, and as I was preparing to t departure, Mr. Lindsay expressed his strong belief that the C Committee have attached and will continue to attach consi importance to the views of the Press in India and of the Chambers of Commerce on the points under discussion. "I reason," he added, "I earnestly hope that when the Blu arrives, the reports of the evidence contained in it will be fre fully discussed."

WINDING UP THE WATCH.

IT is my custom to wind my watch every night at ten. W go to bed I lay the watch on a little table at the head of t Should I chance to wake in the night I always hear the clea tinct ticking. But one night recently I awoke and heard no from my faithful friend. "What!" said I, "is it possible I fo wind it?" To light the candle and put the watch to my ea but a minute. Going still? Yes, going still; but very feeb faintly. I wound it at once, of course. Then it spoke out arousing echoes in the stillness, and to its monotonous r dropped off to sleep.

That other watch—the watch in your breast. Ah! it doesn let that run down, for, unlike the pocket watches, when *it* s stops, as the children say, "for keeps," for good and all.

Therefore Mrs. Susan Gladdish's statement that her "hea to stop beating" cannot be accepted literally. She doesn't n so. She means that at times it beats so feebly and faintly she hardly feel it. "It alarmed her very much," she says. No But what ailed it?

"In July, 1892," she says, "I began to feel ill. At first I fe and weak, without life or energy. I had a bad taste in the spitting up thick phlegm and a sour, frothy fluid. My appeti bad, and after eating I had a sense of pain and weight at the I had also frequent attacks of dizziness, and had I not taken something I should have fallen to the ground.

"As time passed I grew weaker and weaker until I could walk across the floor. For six months I was confined to the The doctor said my heart was exceptionally weak. He ga medicines and told me what outward applications to make wh attacks came on. They did no good though.

"I was in this condition sixteen months, when, in Novem last year (1893), my brother told me about the benefit he had re from Mother Seigel's Curative Syrup during an illness he ha through. This made me hope the Syrup might do me good had done him. I got a bottle from Mr. Wiseman, Grocer, Street, and after taking it for a week I felt relieved. By the had taken three bottles I was cured, and have had no return trouble. Had I known of this medicine sooner I should have spared a deal of suffering. (Signed) Mrs. Susan Gladdish, 7, down Place, Perry Street, Gravesend, January 10th, 1894."

We could quote the words of several other persons, mostly w who have passed through an experience virtually identical wit of Mrs. Gladdish, but it is not necessary, as the comment case will apply to theirs.

One point at a time, then. The heart is no weakling, no flower that must be constantly nursed and tended. It is a powerful muscle, and does more work, far and away, than any organ in the body. All the others stop and rest betimes. heart never does. It hammers away, year in and year out, da night, work-days, holidays, and Sundays. It is kept going b nerves, the nerves are kept going by the blood, and the bl merely digested food from the stomach. There's the connecti

Mrs. Gladdish was afflicted with indigestion and dyspepsia. poisoned and thinned her blood, starved her nerves, and mad nerves unable to give the usual strong impulse to the heart. the heart beat feebly; the brain, insufficiently supplied with caused the dizziness, and the *general* lack of nourishment t whole body caused the weakness, pain, and loss of flesh. The went to the bottom of the difficulty, expelled the poison fro system, and restored the digestive powers. The food then gave new vigour to the nerves, and the nerves set the heart at vigorously, and on full time.

In other words, Seigel's Curative Syrup wound up the Please remember this simple yet wonderful process.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (*August* 12, 1898) says :—Moderate supplies were offered at auction consisting chiefly of Costa Rica, Guatemala, Columbian and other Central American descriptions.

Costa Rica sold steadily for lower qualities but at full prices for colory kinds. Guatemala and Columbian part sold at a slight advance and remainder held for higher rates.

Only 76 bags East India were catalogued, a few lots of undesirable qualities sold at irregular rates.

Futures. On moderate receipts and firm Brazilian markets prices advanced about 9d.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Fortnight ending August 10*th*, 1898, says :—Bank rate 2½ %. Bombay Exchange closes at 1s. 3⅞d. Brazil Exchange 7 5/16d. Rupee paper 3½ % 62⅞. Silver 27 5/16d. per oz.

The moderate quantities offered at auctions since the re-opening of the market last Thursday have met with a good demand, and we have to report an advance of 1s. to 2s. per cwt. for most kinds, especially the better grades of Columbian. Good Plantation Ceylon continues to realize extreme values. Brazil markets are firmer.

At the Rotterdam sale held yesterday, 22,154 bags 38 cases were offered and sold at an irregular decline of ½ to 1 c. on valuations, good ordinary Java realizing 37¼c., against 35 c. at the June Sale.

According to Messrs. During and Zoon, the European stocks on 1st instant showed the small decrease of 300 tons, whilst the total visible supply was 13,510 tons larger, the respective figures being 207,400 tons, against 207,700 tons on the 1st July, and 338,230 tons against 327,420 tons on the 1st July.

Futures have been more active, and close steady at an advance of 9d. to 1s. 3d. per cwt., viz. :—Good average Santos in Havre, September delivery, fcs. 37.75, in Hamburg pf. 31, and No. 7 low ordinary Rio in New York $5.70.

London advices dated 12th August, 1898, state that coffee continues to meet with a better demand, nearly all the business being in Central American descriptions, with which the market is almost exclusively supplied. Fine coloury qualities are very scarce and are eagerly competed for at higher rates. "Futures" are about 1s. dearer; good average Santos is quoted at 29s. 6d. for August, 29s. 9d. September, 30s. October, and 30s. March.

The improved demand noticed last week has continued, and nearly everything offered at auction has found buyers at good prices. East India and Mocha, however, continue neglected. The small supplies of Plantation Ceylon sold with competition at extreme rates. Jamaica slow of sale. Nearly all the business effected has been in Central American descriptions, with which the market is almost exclusively supplied; fine colory grades, being scarce, are eagerly competed for, and realise fully 2s. advance, dull qualities also improving 1s. "Futures" have been firm, and prices close at an advance of about 1s. per cwt. for the week, viz. :—

London	...Santos	...September delivery	...	30s. 0d.
New York	...No. 7 Rio	... „ „	...	5·65 cents.
Hamburg	...Santos	... „ „	...	30¾ pf.
Havre	...Santos	... „ „	...	37½ francs.
Holland	...Good ordinary Java	...	...	37¼ cents.

Auctions on 12*th ultimo.*—Auctions to-day embraced 4 tierces 36 casks 12 barrels 1 bag Plantation Ceylon, 302 bags East India, 63 bags Liberian, 1,625 bags Costa Rica, 521 bags New Granada, 594 bags Colombian, 107 bags Porto Rico, and 519 bags Savanilla. The market was steady to-day, and nearly all offered sold at previous prices.

PEPPER.

Advices of the same date state that Singapore Black has been sold on the spot at 4 25/32d. for fair; parcels near at hand have been done at 4 15/16d, July, September, and August-Oct. shipment at 5d, Sept.-Nov. at 5 3/16d, and October-December and November-January at 5¼d. Tellicherry, Sept.-Nov. shipment has been sold at 4 11/16d. Of White, sales of Singapore Aug.-Oct. shipment have been made at 8⅞d. (closing at 8¾d); Penang, Sept.-Nov. and Oct.-Dec. at 8 1/16d. down to 8d, and Dec.-Feb. up to 8¼d, closing at 8 1/16d. sellers. On the closing day of the mail :—

Black.—A firm market and dearer. Singapore Sept.-Nov. shipment sold at 5 1/16d. 100 tons sold.

25 tons Tellicherry, Aug.-Oct. shipment, sold at 4 11/16d. c.i.f. delivered weights. The price from first hand sellers is 4⅞d. c.i.f. Singapore October delivery sold at 4 15/16d.

1,000 bags Singapore on the spot sold at 4 13/16d. cash less interest and further buyers.

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated August 5*th*, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899...	89,274 packages.	210,651 packages.	6,612 packages.
1897-1898...	89,626 „	238,857 „	8,646 „

4,138 *pkgs.* INDIAN
— „ CEYLON
711 „ JAVA
} Total 4,849 packages were offered in public auction this week.

Deliveries of Indian Tea during July were fairly satisfactory, showing an increase of about half a million pounds over last year. On the other hand the deliveries of Ceylon tea show a falling off of about one million

pounds. We give below a table showing the average prices obtained each week for the Indian and Ceylon teas since the commencement of 1894.

SUBSCRIPTION.—Advance Rates : Yearly, Fifteen Rupees ; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee ; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duff & Co., Proprietors, "Planting Opinion," 11/12, Second Line Beach, Madras.

IMPORTANT NOTICE.

The Offices of this paper having now been removed to Madras, all remittances should be made payable to E. C. Duff & Co., Proprietors, *Planting Opinion*, 11 and 12, Second Line Beach, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should also be addressed to the Madras Office.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 16th September, 1898.

Season Reports should be sent to the Printers, Messrs. ADDISON & Co., direct, and not to *Planting Opinion* Office.

Coorg.

POLLI BETTA, *7th September.—Weather.*—Continuous rain since the 31st ultimo inclusive. More rain during these few days than during the whole of August. Average daily rainfall over 40 cents. *Plant-diseases.*—This rain is good for this season's supplies, but will probably bring on a big attack of leaf-disease, which is already showing up badly in parts. *Grain.*—Price of grains continue grievously high. *Works.*—Most seasonable works well in hand.

Kil Kotagiri.

1st September.—Rain.—We have rain now and cannot complain. From the 25th August the rain has been 5·01 cents. Planting is now being carried on again where it was not finished in the early rains. *Crop.*—Picking is starting in a small way, and a berry here and there is ripening up. It is to be feared this year the percentage of light will be high, and the average to the ton instead of being 90 to 95 bushels parchment will run nearer 100 bushels per ton. But crops are good. *Leaf-disease* has started here and there, not so badly as last year, and it is to be hoped will not do much damage. *Health.*—Good. *Labour.*—Plentiful.

CINCHONA.

ON another page of our present issue we give the Madras Government's review of the Report on the Administration of the Cinchona Department in 1897-98 by Mr. W. M. STANDEN, Director of Government Cinchona Plantations, Nilgiris. This review was, unfortunately, crowded out of our last week's number. We take the report up now, however, and find in it many points interesting to planters that find little, if any, reference in the Government's review.

First, however, we may note the chief figures given in the report, as these, naturally, are of the first importance with Government. Coppicing and thinning operations during the year were confined to sickly trees on ridges and poor soil and to trees on replanted land. The total amount of bark harvested during the year was thus only 128,349lb. from 118,683 trees as against 186,867lb. from 23,840 trees in the previous year. The yield of the plantations was supplemented by the purchase of 108,934lb. of bark in the local market. Adding the stock of bark on hand at the close of the previous year, the total amount of bark available for manufacture during the year was 484,034lb. In other words, after carrying forward 246,751lb., the Director added to it 128,349lb. yielded by the Gardens and 108,924lb. purchased from private planters. This gave him a total of 484,034lb., and out of this he disposed during the year 1897-98 of 241,895, thus ending the year with a stock of 242,139lb. as against 246,751lb. in stock at the beginning of the twelve months referred to. The stock of quinine at the beginning of the year was 4,862lb., at the close only 3,618lb.; while the figures for febrifuge are 1,227lb. and 5,660lb. These accentuate the falling off there has been in the demand for febrifuge. We are glad to find that quinine, on the other hand, is in ever-increasing request. The following small table shows the issues of quinine and febrifuge since 1889-90 :—

—	Quinine.	Febrifuge.
	lb.	lb.
1889-90	234	7
1890-91	1,356	200
1891-92	3,344	3,017
1892-93	3,204	2,608
1893-94	2,536	3,513
1894-95	3,631	3,956
1895-96	5,644	2,666
1896-97	5,908½	3,709¼
1897-98	6,336½	1,955½

Some interesting figures are also given in regard to cost of production. The cost of the chemicals used per pound of febrifuge extracted from red barks was As.15-11, while the chemicals and oils used for the extraction of quinine and febrifuge from the crown barks cost Re.1-8-1 for each pound of alkaloid. The cost of 11,481lb. alkaloids was Rs.82,705-4-1, or Rs.7-3-3 per lb. The cost in 1896-97 was Rs.8-2-2 per lb. of alkaloid, and, deducting the value of the raw material used, the cost of manufacture and distribution was Rs.2-0-7 per lb. against Rs.2-7-7 per lb. last year. The crown barks treated during the year yielded an average of 4·04 per cent. sulphate of quinine and 1·65 per cent. of febrifuge, while the red barks gave 3·75 per cent. of febrifuge. A small proportion of the purchased bark, viz., 8,934lb., gave the very high outturn of 6·40 per cent. sulphate of quinine and 1·04 per cent. of febrifuge, and the remaining 100,000lb. averaged 3·74 per cent. sulphate of quinine and 1·75 per cent. febrifuge.

The most interesting points in the report from the planters' point of view are the above particulars regarding barks purchased from private growers, and certain remarks made on the subject of replanting and the restoration of exhausted soil. Before noticing these latter, we ca readers' attention to the following statistics showin annual yield of barks since 1889-90 :—

—	Crown and Hybrid barks (quinine and febrifuge barks).	Red barks (febrifuge barks).	Total
	lb.	lb.	
1889-90	6,650	8,600	1
1890-91	96,200	...	9
1891-92	122,500	22,000	14
1892-93	157,771	13,946	17
1893-94	52,600	122,400	17
1894-95	152,800	43,800	19
1895-96	136,000	97,800	23
1896-97	237,000	1,100	23
1897-98	125,934	114,650	24

These figures represent the outturn of three "esta Dodabetta, Nedivattam and Hooker. The first is the important. It is in very satisfactory condition, and STANDEN states that "it is undoubtedly the finest cin estate of its size in Southern India." He remarks th growth of shoots from coppice stools has, in some pa the estate, been very good, but in other parts the r have not been satisfactory. A small plot was cleared planted with plants raised from seed received from Ja mainly to enable a comparison to be made betwee growth of plants on virgin soil and that of plants g on old cinchona land. The Director remarks tha difficulty experienced in growing a second crop of cinc on land which has been for many years under cin cultivation raised the question of the deteriorati crown bark plants grown from seed taken from the trees on the plantations. For this reason fresh see obtained from Jamaica. But, he adds, if it can be p that no deterioration of the plant has occurred, the of success which attends the replanting of old cin land must be due to a deficiency of plant food, or change in the physical condition of the soil, or to a com tion of these causes. He is inclined to think that the cause is a change in the physical condition of th brought about by years of cultivation and exposure t and wash. "Such soil," he observes, "is greatly in in the power of retaining moisture to virgin land contains an ample supply of humus, and when it is sidered how trying to plant life is the long peri drought which is characteristic of the climate o Nilgiris, the importance of the retention of moistu the soil cannot be over-estimated." He purposes t periment on the lines of a period of fallow, the appli of manure, and the planting of shade trees.

With further reference to the subject of manure STANDEN points out that the numerous and valuable e ments made by Mr. D. HOOPER on the action of manu raising the quantity of alkaloids in cinchona barks c sively proved the desirability of the application of fert containing nitrogen, potash and phosphoric acid, but alt it was shown that, in the case of individual trees, the a of quinine was increased 50 per cent. and sometimes more by suitable manures, no steps have hitherto been to profit by the conclusions drawn. Various manures as fish, bonemeal, nitrate of potash and castor poona been applied from time to time, and in every ca

nprovement in the richness of the bark has been considerble, but the cost of the application was not recorded, nor ere the experiments made on a sufficiently large scale to be f much practical use. He then gives the following interestng details of experiments made during 1897-98:—"Of 2,400 ees on the Dodabetta estate, 800 were treated with a ixture of nitrate of soda, nitrate of potash, bone-meal and astor poonac, 800 received super-phosphates, castor poonac nd nitrate of potash, and 800 were left unmanured. The ems of all the trees that were manured were covered with rass in view of the fact that the exclusion of light favours ne development of alkaloids, and renovation pits were ug among the manured trees. The unmanured trees were ft uncovered and will receive no more cultivatiou than the rdinary weeding and digging given to the rest of the lantation. At the end of a year the 2,400 trees will be ppiced, and the bark yielded by each plot of 800 trees ill be worked up separately in the Nedivattam factory. A areful account will be kept of all expenses incurred on each f the three plots from the time of the application of the anure, and the yield of quinine and febrifuge will be ecorded for each plot." In this way, the Director remarks, is hoped that it will be possible to prove that when a nchona estate is worked on a coppice rotation, it is highly rofitable to adopt every possible means of enriching the ark before the trees are cut down. The 800 unmanured rees will probably yield 4,000 pounds of bark analysing per cent. or 160lb. of quinine, and it is expected that each lot of manured trees will give 4,000lb. of bark analysing per cent. or 240lb. of quinine. Taking the value of uinine at Rs.10 per lb., the increased yield would be worth s.800, while the total extra expenditure on each of the anured plots will not be much more than Rs.180. So that ere would be a profit of about Rs.620 per acre if the sulhate of quinine was increased 50 per cent., *i.e.*, from 4 per ent. to 6 per cent. An increase of rather less than ½ per ent. of quinine will, it is estimated, cover the cost of the anure, &c. If results prove these calculations to be correct, Ir. STANDEN will deserve additional praise beyond that hich Government has rightly accorded to him for his work uring 1897-98. His report for that year is unquestionably f great value, and we would recommend all cinchona-planters n Southern India to study it attentively. At the same time e think that they might reasonably ask how, in the face of he figures given in that report, the Madras Government can ustify the conclusion expressed in G.O., No. 140, of 10th March, 1898, that in addition to the purchase of bark rom private growers, it was necessary that the plantations hould be extended.

THE PRUNING OF TEA.

WITH reference to an extract frrm a Colombo contemporary that is published on another page, we may emark that although the recent correspondence concerning he Pruning of Tea has been very interesting, we have not bought it necessary to publish any part of it *in extenso*. Our contemporary's summing up will suffice to indicate the general lines of argument, and we would only add that ome few of the writers did not, apparently, distinguish etween real *pruning* and what Dr. (now Sir George) King ermed in the Agri-Horticultural Society's Journal for 1871 "mere meaningless mutilation." The paper from which this term is quoted deserves to be studied over and over again, and we cannot but think that our Ceylon friends would learn something about tea-pruning from it, or from the extracts that Dr. Watt gives from it in his recent work on Pests and Blights. At the time Dr. King wrote there was scarcely any true pruning practised by planters in India. Dr. Watt has largely utilised his predecessor's remarks, but has also been able to profit by the experience gained by numerous planters who for years past have tried to adopt definite systems of pruning. There are so many considerations to be borne in mind in matters of this kind, that one man's experience may need to be subjected to various modifications before it can be adopted by a brother-planter as his guide also. It is, however, a happy sign of the times that there is much more inclination among planters nowadays than there was in earlier years, not merely to study scientific points theoretically, but to make practical experiments thereon, and to apply in the daily routine of the estate the lessons thus learned. This is as it should be, for, as Mr. Parsons (we think it was) pointed out at the 1897 meeting of the U.P.A.S.I., a scientific expert would be of comparatively small value to the planting community unless some among them were in a position to furnish him with *data* to work upon. It is for them to detail their experiments and their experiences, leaving Science to declare which are causes and which effects; which are good, which bad; and to find remedies for all that is harmful to the plants under cultivation.

NOTES.

Pepper. Last year's Pepper crop in India was short of the average, and this year's seems likely to turn out worse.

Coffee in Coorg. The Government forecast of the Coffee crop in Coorg puts it down at 2,730 tons from European and 1,470 tons from Native gardens, making a total of 4,200 tons, or a total of 79·2 per cent. of the average annual crop.

Ceylon Tea. A Colombo contemporary observes that the official tea crop estimate will be revised early next month. The total shipments to the United Kingdom for the current month amount to about 6,250,000lb., the smallest quantity shipped in any month this year. The shipments during July were 10,411,701lb.

Ceylon Tea in London. Telegraphing to the *Times of Ceylon* on 1st instant, Messrs. Gow, Wilson and Stanton, London, reported a steady market, and quoted fair liquoring Ceylon Pekoe Souchong at 6¼*d*. The average price of Ceylon Tea sold on garden account during the week was 7¾*d*.

Ceylon Tea Sales. At the public sale of tea at Colombo on 31st ultimo, 6,759 packages — 515,536lb. were offered, of which 5,155 packages — 393,915lb. were sold. The sale showed common teas somewhat easier, though all good medium and fine kinds realized full rates, and in some instances showed an advance.

Estimates of Coffee Crops.

Coorg always manages to turn out an annual estimate—whether correct or not. Is it impossible for Mysore, the Nilgiris, Nelliampathis, Shevaroys, &c., to do likewise? The officials concerned could surely manage some sort of an estimate, if they would but take the work in hand.

Locusts.

A Home paper states that the locust disease fungus, cultivated by Dr. Edington, Director of the Bacteriological Institute, Grahamstown, is proving effectual in exterminating this pest. Internal doses of a liquid in which the fungus culture was dissolved were given to some locusts which were liberated among three swarms, and in seven days the swarms were destroyed.

A Failure.

"Alinit" is a yellow powder (regarded as a microbe) "made in Germany," which is supposed to foster cereals even in soil poor in nitrogen; but, according to a Home contemporary, recent experiments made with it by Dr. Paul Wagner, Director of the Agricultural Experiment Station at Darmstadt, have given negative results. Its value may, therefore, be questioned until further experiments have settled it.

Tea Sales in Calcutta.

The average at the Calcutta Tea sales on 26th ultimo was 5 annas 7 pies. About 20,000 packages were to be offered on 2nd instant. At the Calcutta Tea sales on Friday, the 2nd instant, 20,000 packages were offered and 19,000 packages were sold. There was a rather better spirit, all good liquoring kinds were steady, and leafy teas for price were firm, while poor liquoring kinds were again easier. Darjeelings showed a great falling off, many invoices being withdrawn.

Pastures New.

The Seychelles are being "boomed" just now as offering all that is charming and profitable for worn-out Anglo-Indians, as well as for young men with a thousand pounds each to spare. It is even said that some planters from Behar who recently visited Mahé were so impressed that they are going to "quit Indigo" and try what the Seychelles will do for them. Pray, do not all go at once, gentlemen, or our subscription list will suffer!

Imperial Courtesy.

The Austrian Consul at Colombo has received a large-sized photograph of His Imperial Majesty, Fransz Josef, Emperor of Austria. The photograph is intended as a gift to the Planters' Association of Ceylon, as a return compliment for the present of Ceylon Tea, together with the album of views sent by the Association to the Emperor. It is handsomely framed, bears the Emperor's autograph, and is accompanied by a letter from His Majesty.

Mr. Chamberlain on Pests, &c.

Speaking upon the Colonial Grants-in-Aid lately, the Right Hon'ble Joseph Chamberlain, Secretary of State for the Colonies, observed:—"It is not easy to extend indefinitely the production or sale of any particular plant or produce. In the first place it seems as though nature revenges itself in some way or other, because almost invariably the action is followed by some kind of insect or pest by which the industry is hampered damaged, as with the coffee in Ceylon and arrowro Montserrat and other industries. Not only that, b the demand in all these cases is limited, if you increas production too rapidly, you destroy all profit in conne with it."

Nilgiri Tea.

A correspondent writes t *Madras Mail* from the Nilgir "A Ceylon planter buys Glen Morgan estate an Assam planter invests in a half share of 'Dunsandle Es and there is a good deal of talk about a large Com being formed to take up some tea estate on these hills now that nearly all plantable land is reserved, e should go up in value, and it behoves the Nilgiri plan keep abreast of the times by having good machinery experienced men in charge of the Factory and not le to the 'tea-maker.' These hills can produce just as a tea as Ceylon, and have much in their favour that C has not."

Tea in New York.

The *American Grocer* of 3rd remarks:—The auction sale day, by the Montgomery Auction and Commission C 14,022 pkgs., will be a good test of the market, whic ruled firm since our last. Demand has been light. sale includes new crop teas, including Formosa. Mediu good medium Japan, 25 at 26 c. The Appraiser's rejected during July 802 pkgs. tea or 32,846, po of which 629 pkgs. were Pingsuey. There were p 33,045 pkgs. or 2,043,850 pounds. Not a packa Formosa, Foochow, India, Ceylon or Japan tea wa jected. The following are the wholesale market quot (gold dollar cents) from the same newspaper's *Current*:—*India.*—Pekoe Souchong 18 at 20; Pekoe 24; Orange Pekoe 25 at 30. *Ceylon.*—Pekoe Soucho at 20; Pekoe 22 at 24; Orange Pekoe 25 at 30; Orange 35 at 45; B. C. Pekoe nominal. *Darjeeli* Pekoe—at 33; Orange Pekoe 35 at 40; Fancy O 55 at 60.

Prospects of Coffee Prices.

It is satisfactory to learn, o authority of a Home paper, that prospects affect the London v of Indian Coffee, as well as those of Indian Tea. A co porary says:—"All reports which have reached us from the South-west Coast of India regarding the str of the monsoon are far from satisfactory from a pla

---

14·92 „ Lime.
13·68 „ Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of see the parent trees of above analysis at Rs.6 per pound cont about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywher from the

MANAGER, ARIENKOW ESTATE,

Shenco

point of view. It appears that the first half of the rainy season has been greatly disappointing, a small quantity of moisture having fallen, far too little to give the young plants a fair start, and the rains in the latter half, although better, have so far not been sufficiently strong to counteract the damage done to the growing crop. Coffee in the Coorg and Neilgherry districts alone promises a fair yield, whilst Mysore, Wynaad, etc., have suffered considerably, and the planters there are greatly distressed at the poor prospect of their crops. High prices for fine coloured East Indian will, therefore, be the rule, we fear, in the coming season." The last sentence is cheering enough, whatever may be said of the others.

The Paris Exhibition. Read this from a Colombo contemporary:—"Most of the preliminary arrangements connected with the representation of Ceylon at the Paris Exhibition of 1900 are now complete. H.E. the Governor has appointed a Provisional Committee consisting of Sir Fredrick Saunders as Chairman, the Chairman of the Chamber of Commerce, the Chairman of the Planters' Association, the Mayor of Colombo, Mr. Drieberg, Principal of the Agricultural College, and Mr. Willis, Director of the Peradeniya Gardens. It has also been determined to do the thing properly, the pushing of Ceylon tea being, of course, the first consideration kept in view. Application was made a little time ago by wire of the British Commissioners for 2,000 square feet of space, but inasmuch as the total space allotted to the British Colonies was very small, it was only by taking some from the space given to India, that the quantity we required was eventually made up. For this space £6,000 was asked, and this we have agreed to pay." Now, what has India done so far? Especially, what has been done for Indian Tea and Indian Coffee, and Indian Cinchona? It is a curious thing that Ceylon always shows more "go" than India. Is it the *spices* that bring this about, or is it the mere activity of the small as compared with the sluggishness of the bulky? In either case we should like to see Indian Planters forming an exception to the general "To-morrow" rule of India—the rule that lays down that man must do nothing to-day that he can manage to leave over for to-morrow, and so on *ad infinitum*.

Tea and Coffee Markets. *Indian Teas.*—The *Produce Markets' Review* of August 13, 1898, reports:—The market has been more active, in consequence of the better selection offered, and the demand generally is improving. For the finest descriptions the bidding was brisk at the sales and firm to advanced prices were paid. This particularly refers to the Assam and a few Darjeeling growths, the former being quite equal, and in some cases superior, to the earlier shipments, and there appears every indication of an ample supply of these grades later on. Current values will no doubt, on the whole, be maintained for some little time, but should there be the same proportion of fine grades in future imports, a lower level of prices is most probable. The few lots of fine Darjeeling offered were eagerly competed for; this is not surprising considering the absence of fine Teas from this district for several months past. Values for the finest Teas of this growth are more likely to be maintained than for similar grades of Assam, as the proportion is much smaller, and there is likely to be a continued good demand for them. There is little improvement in the Teas from the Sylhet and Cachar gardens, the former particularly being unusually poor, and are mainly bought for leaf, prices being favourable for imparting freshness to the low-priced blends. At the public sales 26,300 packages were brought forward and mostly sold.

Ceylon Teas.—The public sales for the past week included more Ceylon Tea than has ever before been offered in a similar period. Some 40,700 packages in all were brought to auction, which necessitated spreading the sales over two days, part being sold on Tuesday and the balance on Wednesday. Notwithstanding these excessive supplies, prices were distinctly firmer for nearly all descriptions. The lowest kinds especially were keenly competed for, and consequently in many instances a distinct advance was established. The quality of the Teas generally showed no improvement, a large proportion being extremely poor, while the comparatively few parcels or really "stand out" Teas realised extreme prices. Out of the 40,700 packages printed, only 1,467 failed to find buyers in the auction room.

Coffee.—According to the statistics just published, the European imports and deliveries during July practically balanced one another, but the world's visible supply increased by 13,740 tons, and the total is now given as 336,440 tons against 265,500 tons a year ago. Large as this amount is, it is barely equal to five months' deliveries in Europe and the United States, if the rate of delivery is to continue the same as in the first seven months of this year. It is no doubt quite possible that the large increase in the deliveries does not mean a corresponding increase in the consumption, but at the same time there can be no question that the very low prices have stimulated it, particularly in the United States. The improvement in the demand noticed last week has continued, and the small quantity brought to auction has sold freely at dearer prices for nearly all descriptions, common and medium Costa Rica being from 1*s.* to 2*s.* dearer, while new crop Colombian shows a much larger advance. Ceylon has again sold at very full prices, while only a few transactions are reported in East India.

LETTERS TO THE EDITOR.

CASTOR-CAKE AS A TEA MANURE.

Sir,—A Ceylon planter asserts that ordinary castor-cake appears to improve the quality of tea to some extent. This article does not appear to be mentioned in the chapter on Tea Fertilisers by Mr. David Hooper in Dr. Watt's *Tea Pests and Blights*. Has any South Indian planter tried it?

A. R.

GENERAL ARTICLES.

TEA FOR RUSSIA.

The *I. P. G.* remarks:—

Although tea is largely drunk in Russia, yet the quantity used per head is very small, as a beverage is made of very mild tea mixed with lime juice, and is not infused in the same way as we Britishers manage it, and what a homely housewife at home would consider only enough to infuse a couple of cups would serve a whole Russian household. The combination of the lime and the weakness of the tea

infused give the liquor the appearance of what is known as Montserrat Lime Juice before it has been diluted with water, and milk is scorned as it would not keep, and the Russian likes to keep his drink to spread over the day, he does believe in taking it by the cup, as we do. We notice Ceylon is trying to capture the market, but we do not anticipate much success for a time, unless they manufacture specially for Russia. What used in olden times to be called *namoona* tea would suit admirably. *Namoona* tea is a sort of a hybrid between green and black tea. The leaf when brought in is put into a *currié* or metal vessel, which is warmed. This makes the leaf limp, and it can be then rolled by hand, and after so doing allowed to remain an hour or two in the ball; then put in the dryer and fired off. It has a remarkable flowery appearance from the white tip and draws a very pale straw-coloured liquor. It is admirably suited for the American palate, as well as Russian, and some of our planters might try a little as an experiment, and we think it would pay them.

MANURE-YIELDING TREES.

MR. T. W. S. SMYTH, Executive Engineer, Periyár Works, Madura, wrote to the Superintending Engineer, VI. Circle, on 22nd September, 1897: "The ryots say, and I believe with a good deal of truth, that the lands will, without much manure, bear only one crop, and it may be said that the financial success of the project depends to a great extent upon a large area of second crop being grown, and everything possible in the way of growing leafy jungle on the Sirumalai and Alagar Covil hills to provide leaf manure, or in any other way, should be done. It might even be advisable to try the effect of guano, or artificial manures, upon the lands." The attention of the Board of Revenue was drawn to this, and the matter was then referred to the Conservator of Forests, Southern Circle, for report. The Acting Conservator, Mr. C. E. Brasier, wrote a very interesting letter on the subject, stating that he had consulted the Collector of Madura on the subject, and had been informed that the matter attracted the District Forest Officer's attention already while on inspection. He was of opinion that every endeavour should be made to encourage the growth of shrubs and trees producing leaves suitable for manure, and that provision should be made for this when preparing working plans. Mr. Brasier proceeds:—"He says that at present no restrictions are put in the way of the ryots wishing to procure permits for manure leaves, but if this continues the hills will soon become as bare as the Pachamalais in the Trichinopoly district. It would appear to me from the Collector's reply that the time when something will be done—viz., when working plans are being prepared—is somewhat indefinite, and from the latter portion of his letter (copy enclosed) it would appear that when this time arrives there will be considerable risk of having nothing but barren hill sides to operate on. The subject seems to be of such importance as to merit immediate action to prevent denudation and possible washing away of soil on the very hill sides themselves with the usual result of burying cultivable lands at their foot in gravel and débris. One of the most, if not the most, valuable shrubs of plant used for manure is the *Tephrosia purpurea* (Kolingi—Tamil) which springs up readily on most dry lands in the southern districts of the Presidency; its seeds can be collected cheaply and in vast quantity, and I believe ryots in Tinnevelly actually sow their dry lands with this seed in order to reap or uproot the plants solely with a view to manure. It may, therefore, be worthy of consideration whether the Forest Department should not place a portion of the hills in question under treatment on a very short rotation solely with a view to the production of a manure-yielding coppice or pollard forest. Vacancies in the existing stock might be filled in by dibbling Kolingi or other nitrate-yielding species. The species that are valuable for this purpose are those that belong to the *Papilionaceous leguminosæ*, and these might be specially encouraged in preference to other species which might be eradicated. By some such means a maximum yield of manure from a minimum area of forest might be obtained. Nor will it be necessary to work the forest at a loss on this system, as will be readily understood when I mention that ryots and mittahdars in the Salem district actually sell the right to take Kolingi from their lands at from Rs.5 to Rs.7 per cart-load of 22 head-loads. Altogether the subject is one which, I think, it is the duty of the Forest Department to study, more especially in the special circumstances of the large and sudden increase in the irrigated area of the Madura district, which on this account alone appears to offer the most likely locality for successful experiment."

These remarks should be of interest to our readers, many of who have doubtless already learned to appreciate trees not only as shad givers, but also as manure-yielders.

SMALL FARMING FOR RETIRED PLANTERS.

THE London correspondent of the *Times of Ceylon* ha some interesting remarks on a field of occupation that open for retired planters and colonists who are quittin exile to enjoy life "at Home" once more. He says:—

Planters and others of your colonists retiring on small means, forced to leave Ceylon from ill-health, are much concerned to kno into what channel they shall invest their money and what to that will give them employment and aid them to keep the wolf fro the door. This is well known here, and many are the schemes th will come before them which are tempting but undesirable. Ver lately, I gave myself some little trouble to look into an investment house property an old friend from Ceylon thought he would do we to go into, and my objection to the whole scheme was very quickl acknowledged by him. The most natural employment for the retire planter is farming—and not a few have gone into it. There is no a far better chance, by increased railway accommodation and th rapid additions to books upon the subject, of farming being succes fully carried out. Everything, moreover, now points to a *peti culture* as the farming of the future. Therefore the potentialities a moderate-sized farm present themselves in a far more auspiciou light than was possible some years ago. A recent article gave som very interesting details in this connection. It spoke of farms of 6 acres. It looked to the farmer having £600 to start with. £10 pe acre it thought none too much to spend to secure a sure foundatio and to be in a position to take advantage of falling markets b buying food-stuffs and stock at great advantage. Twenty-five acre it advised being set apart for pasture and thirty-five for arable lan The object of this was to keep the largest amount of stock withou over-crowding. To make the farm pay, after giving sufficien attention to ordinary farms tock, it insisted upon poultry, rabbits an fruit-growing being adequately represented. Two horses it cons dered indispensable, and it considered a dairy of six to eight cow would aid the success of the venture. Beyond the courteou accommodation of neighbours, not a drop of milk was to go off th farm. Butter-making might not be so profitable as milk selling, bu the produce of six cows, on a small farm where a large herd of pig and fattening poultry are kept, it considered far more valuable tha disposed of as new milk. The butter would give a moderate return but the skim and butter-milk would be simply invaluable fo securing high-class pork and table poultry. Pig-keeping should b regarded in a serious light as the mainstay of the business. Pur large Yorkshire whites, or a cross of these with pure Berkshire, i recommended as best. An average of 100 pigs should be kept and i large sheds with plenty of room, with abundance of clean, swee straw in place of the old style of stye. It is very hard lines on a pig which is naturally a very cleanly animal in its habits, that it ha so long been so badly housed. Warmth, cleanliness and prope ventilation are a *sine quâ non* in stock-keeping. Rabbit-breedin with 1,500 young rabbits annually it showed would produce £37 pe annum, more than half the rent of the farm. Hutches were con demned, a barn partitioned off and floor covered with clean straw being recommended until the young at six-week old were remove to the warren or run. In that most important section, poultry farming the production of eggs, it said, was to be preferred to that of tabl fowls. It recommended that five acres of arable be set apart, sheltere from north and east winds as far as possible. The whole to be enclose with six feet netting and subdivided into half acres running parallel This would give ten runs, and the whole to be planted with selected half standard apple trees of cooking variety. Planted 20 feet apar each way would give, allowing for fowl-houses, 100 trees to the acre Good six-year old trees cost 2*s.* each = £50. Each run would carry 50 hens, for which suitable houses would have to be erected with southern aspect. Minorcas or Leghorns, being non-sitters, it con sidered preferable. Allowing 125 eggs each hen, 62,500 eggs would be produced, worth 13 a shilling all the year round. Deducting from the amount thus realised £240-7-0, a liberal allowance for food, viz. £117, there is left £123-7-0 per annum. For the first few years there would also have to be deducted cost of houses, enclosing wire and trees. The annual value for five years from the 500 apple tree

would amount to £31-10-0 per annum. After five years the value of the fruit, which would by that time have vastly improved, could be added to the yearly profit. These sixty-acre farms are attracting a good deal of attention just now, as a solution to the ever-troublesome problem, how to bring back agriculture to a profitable employment and rent produce.

Since writing the above I see further confirmation of those aids to agriculture which the literature of the period provides. Mr. Rider Haggard is engaged upon a book called "A Farmer's Year," being his commonplace Book for 1898. It is a daily record of the history of a 360-acre farm from January to December, and of other matters connected with country life in Norfolk. The book, which will be fully illustrated, will begin to appear serially in the September number of *Longmans' Magazine*.

THE FUTURE OF TEA.

ADVERTISING *versus* MANUFACTURE.

THE following extracts from a letter by an old planter, "Looking Back at Ceylon," to the local *Times*, will, we think, interest many of our readers :—

I have faith in Ceylon tea still, and . . . I have a very great faith in the Ceylon tea planter. . . . To tell the truth, I was disappointed in the tea-bush, more especially at first, as I spent some time in the older coffee districts where it has not seemingly been so well able to stand the somewhat cruel treatment it has been subjected to during the last few years, when I suppose it was the order of the day to go in for quantity rather than quality.

I remember, as far back as 1891 or 1892, writing you that I had seen an invoice of Ceylon tea sold in Mincing Lane at 2½*d.* a lb., and warning the Ceylon planter that, even if it did pay the tear and wear to sell at such a price, still shipping home such rubbish would certainly damage the good name your tea had then. I suppose it did not matter so much in those days, as the rupee was so low ; but now, it is another story, and I fancy most men will acknowledge that the system of quantity rather than quality has depreciated the value of your staple and gone a long way towards killing the goose that laid such golden eggs. At least, anyone who has revisited the tea districts lately must think so.

But yet I have faith in the tea plant. It wants a lot of killing, and, notwithstanding constant and savage attacks with the knife, is game to the very roots and will still come up to time again. And I have yet more faith in the Ceylon planter (I mean, of course, the real planter who resides on the estate), if left to himself, that he will come to see before it is too late that too much cannot be expected even from so hardy a plant, and that, with such expert advice as I understand is now available on the spot, he will take proper steps to reinvigorate the bush. It seems to me the practical man living on the estate is not allowed sufficient rope and is made to work too much by rule of thumb. Again, too much must not be expected from a few days' visit by an expert, however good an expert he may be. It must take time and much care to cure an evil which has undoubtedly been going on for years. Still, in many ways, if I am not presumptuous in saying so, I think certain accepted methods of curing your tea might be modified with advantage; say, in reference to withering in damp weather, rolling, fermenting and firing; and more particularly in sifting, which, I think, ought to be done more during the rolling process than after the firing.

QUANTITY *vs.* QUALITY.

But I am perfectly alive to the fact that I can scarcely now be looked on as an up-to-date planter or tea-maker, and that I may be thought even impertinent in making these remarks. Would it be awfully rude to hint that in the very early days, though we had vastly inferior factories and no machinery at all to speak of, we yet managed, somehow, to turn out a tea which fetched over double the present average price of Ceylons in the Lane? But I am always told that, though that is true, I must remember the quantity now treated is so much more. That I think is the whole matter in a nutshell. Why not take as much pains with the large quantity as we did with the small, or only treat as much as you can afford to treat well? I am convinced it is not the large quantity but the poor quality of Ceylon tea now which has so much reduced your average. Let some man try on his own plan, and *sell the parcel under another mark.* A good tea will always, with fair play and sold on its own merits, fetch a good price.

It seems to me the powers-that-be have got hold of the wrong end of the stick. The wise man will spend his money first in making an article as good as he possibly can, and not till that is done will he spend money on advertising it. All the advertising in the world will not keep up the demand for an article if it is not really good in itself.

It is the working class here that depends most on tea, and will pay most for it, if good. A friend told me once that he gave his coachman a present of a pound of tea, for which he had paid 3*s.*—a long price in those days, and that he had told John that it was especially good tea and not a common cheap article. "Oh, Sir," said John, "I always pay that for my tea. I can't abide them cheap teas, they gives me the 'eaves." Poor John, I wonder where he gets his good tea now, but more likely he is dead by this time, of 'eaves.

THE TEA AROMA.

I am afraid to say a word which might seem to hint that the splendid and costly machinery now in such general use in Ceylon could possibly be improved ; but the fact is, I can't think well of the tremendously powerful fan I saw, which, it seems to me, must draw off so much of the aroma in firing. By the way, did we not secure more of the aroma with the modest chulah? A chulah would not be in the running now, of course, but how about the chulah flavour?

THE MADRAS CINCHONA REPORT.

THE following is Government's review of the report on the Administration of the Cinchona Department in 1897-98, to which further reference is made in our leading columns :—

Mr. Standen's report on the working of the Government Cinchona Plantations and the factory under his control during the year 1897-98 is full and clear. The Government will proceed to notice briefly the more important features in the year's administration.

The year under review was remarkable for the comparative failure of the North-East monsoon and the consequent prolonged drought which prevailed from December to March. This caused a certain amount of mortality among the young plants, particularly among those on old land. It would appear that from one cause or another 122,580 plants died during the year. All these vacancies were, however, supplied by fresh plants.

In parts III. and IV. of his report the Director discusses the interesting questions of replanting land which has already borne a crop of cinchona, of regeneration from coppice, and of the utility of manuring. With regard to the question of replanting, the results of the experiments made on the Neduvattam estate appear to establish the inexpediency of endeavouring to replant old land with success as long as new land is available. The Government, however, approves of the Director's proposal to try the experiment of replanting old land under shade. The facts noted by the Director as to the regenerative power of the stools in certain plots certainly warrant the hope that under careful cultivation the cinchona on the Nilgiris will undergo four rotations by coppice without loss of vitality. An equally important question in working a cinchona estate on a system of coppice rotation is whether a large outlay on manuring will be profitable. Mr. Standen has selected three plots

bearing 800 trees each. Two of the plots have been highly manured and the third left unmanured. Careful accounts of the expenditure and return from three plots will be kept, and Mr. Standen anticipates that not only will the direct return from the manured trees, when, coppiced, be greater than from those unmanured, but that the stools on these plots will exhibit a greater vitality and regenerative powers. The results of the experiments will be awaited with interest.

Coppicing and thinning operations during the year were confined to sickly trees on ridges and poor soil and to trees on replanted land. The total amount of bark harvested during the year was thus only 128,349lb. from 118,683 trees as against 186,867lb. from 23,840 trees in the previous year. The yield of the plantations was supplemented by the purchase of 108,934lb. of bark in the local market. Adding the stock of bark on hand at the close of the previous year, the total amount of bark available for manufacture during the year was 484,034lb.

The following statement shows the quantities of bark, quinine and febrifuge, in stock at the beginning of the year, the additions made thereto, and the quantities disposed of during the year and the balance on hand at its close:—

	Bark.	Quinine.	Febrifuge.
	lb.	lb.	lb.
In stock at the beginning of 1897-98 ...	246,751	4,862	1,227
Additions made during 1897-98 ...	237,283	5,092	6,389
Total ...	484,034	9,954	7,616
Disposed of during 1897-98 ...	241,895	6,336	1,956
Balance ...	242,139	3,618	5,660

Work at the factory was much retarded owing to the loss at sea of the fusel oil and sulphuric acid required for the year's manufacture and to the consequent delay in obtaining fresh supplies. As the result only 240,580lb. of the total stock of 484,034lb. of bark were worked up during the year. The quantity of bark yielded 5,092lb. of quinine and 6,389lb. of febrifuge, or 11,481lb. of alkaloids in all. The results of the manufacture show that the factory was most efficiently worked; for the total cost of manufacture and distribution was only Rs.7-3-3 per pound of alkaloid as against Rs.8-2-2 per pound in the previous year. Deducting the cost of the bark worked up, the actual cost of manufacture and distribution per pound of alkaloid was Rs.2-0-7 as against Rs.2-7-7 in the previous year. At the same time the bark appears to have been thoroughly exhausted and no loss of alkaloids allowed to occur, the yield from the crown bark being on the average 4·04 per cent. of sulphate of quinine and 1·65 per cent. of febrifuge as compared with 3·32 per cent. of sulphate of quinine and 1·39 per cent. of febrifuge in the previous year. The yield from the red bark was 3·75 per cent. of febrifuge as against 4·45 per cent. in the previous year. The smaller percentage from the red bark was to be accounted for by the fact that all the bark was taken from trees on replanted land. It is also very satisfactory to note that the quinine manufactured was found by the Chemical Examiner to come up to the standard of purity laid down by the British Pharmacopœia.

The amount of quinine distributed during the year was the highest on record and exceeded the previous year's issues by 428lb. The sales of quinine packets by postal agency continued to show an increase, having amounted to 658½lb. against 628lb. in 1896-97. On the other hand, sales by the Revenue officers showed a further decrease. This matter will be further commented upon on receipt of the Director's detailed report on the sales under the pice-packet system. The demand of the Government medical depôts for febrifuge fell considerably. The decision of the Government not to extend the area under *succirubras* has thus been fully justified.

The total receipts and charges amounted to Rs.98,464 and Rs.95,300, respectively, against Rs.1,47,310 and Rs.82,549 in 1896-97. The fall in receipts was mainly due to the fact that the price of quinine supplied to Government medical depôts was reduced from Rs.18 in 1896-97 to Rs.11 in the year under review. The finan condition of the plantations is exhibited in statements Nos. 10 and 12 appended to the report. From the balance sheet (statem No. 12) it appears that the profit on the year's working amounte Rs.32,852-15-10.

The thanks of the Government are due to Mr. Standen for his effic working of the plantations and factory during the year. Government is also pleased to notice the testimony borne by Director to the good work done by his subordinates.

THE PRUNING OF TEA.

AFTER publishing various letters from planters giv expression to diverse ideas on the subject of the ri method of pruning Tea, the *Times of Ceylon* sums matt up in the following article:—

In all probability the vexed question of the best method of pr ing tea will never be settled any more than the same question applied to coffee was ever set at rest in the old days. Then as there were advocates of heavy and of light pruning, and each sec were confident that they were right and others wrong. But, i much as different methods must undoubtedly be applied in diffe cases, there can be no harm in examining what is said on either s of this controversy. On the one hand, we have men like Mr. Bo and Mr. Roger, who assert that on many estates the productiver of the plant and the quality of the leaf are being impaired by cessive use of the knife; and, on the other, a number of planters wide experience like "E. H." of Dikoya, and Mr. A. D. Maclean, declare that, provided only some discrimination is used, the n severe pruning does not hurt, but rather improves, the tree and vigour. To show how widely opinions differ on this point, we n only instance the fact that Mr. Bowie declares that in no case ou bushes to be taken down lower than 14 inches, whilst "E. H." is favour of occasionally coppicing the plant below the level of ground! This system—of which we confess we never heard befor euphoniously termed "collar-pruning"—is advocated by Mr. Geo Watt, an Indian authority. We refer our readers to the extra quoted by our correspondent from the work on pruning by t gentleman as evidence that he, at all events, did not think the n severe pruning possible would in any way affect the vigor and v lity of the tree. Planters, he tells us, are far too timid in th treatment of the plant—and then he proceeds to advise that "col pruning" should be adopted, though why he did not at once cal "coppicing," we do not know. That tea plants are sufficiently ha to withstand even such drastic treatment as this, all planters well aware. Let only a road be made through an old tea field, unless the plants to be removed are actually rooted out complet strong vigorous shoots will force their way, time after time, throu the road, no matter how much care be taken to destroy the stu If we are to believe Mr. Geo. Watt, the plant actually benefits fr this annihilation, and in time the bush grown on this stump indistinguishable from trees which have not been so treated. can hardly think, however, that this drastic method will ever generally adopted. "E. H.," however, expresses opinions w regard to early pruning, which are, so far as we know, entir opposed to preconceived opinion and general practice. It is usua thought to be a mistake to top young tea too soon, and the longe reason pruning can be deferred, we had always thought, the bet for the future stability and hardiness of the plant. But "E. thinks that the younger the plant when it is first pruned the bet able will it be to withstand the shock. This may or may not be case; but we cannot think that remorselessly heavy pruning repeated oftener than necessary, and applied to trees growing o weak, and non-stimulating soil, can be good for the trees. Circu stances alter cases, and no doubt places where pruning has b carelessly done—where the wood is all hard and white, and lit strong young wood is to be found, will be the better for a pre heavy use of the knife, but this can surely be overdone, and wh it is not actually wanted, it must be putting a strain upon the tr which is unnecessary and therefore hurtful. The wise maxim in t

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

ease would be not to prune more heavily than is necessary to maintain the trees in good heart. All that is done more than that is harmful. Some, of course, hardly believe that any application of the knife, no matter how severe, can be hurtful to the tree; and such is its natural hardiness, that we must confess we have never had any evidence that any particular estate was harmed by the excessive use of the knife, except the instance brought to our attention by Mr. Bowie already mentioned. Mr. Roger, it is true, remarked that we appeared to "have sent all our tea to London, and left nothing but the roots," which looks as if in his opinion—and a casual visitor such as he was often see more than those always on the spot—the trees on most estates had not such large plucking surfaces as he was accustomed to some years ago.

An After Word.

One planter has been allowed to say a few words even after the summing up of the journalistic judge. And very interesting words they are. The following are extracts from "A. A's" letter to the *Times of Ceylon*:—

Among theories which were advanced by some father of all tea planters was one that asserted that topping a young plant checked the growth of the tap root; another, that the more wood and leaf left on the tea tree at pruning, the more favourable was the growth of the bush; another, that the growth of new wood and leaf on a heavily-pruned bush is an effort. Now I contend that a great deal of tea planting in Ceylon has been based on these theories, none of which will stand examination. An examination of a topped tea plant will show that the tap root has not ceased to grow. An examination of two sickly trees, one heavily pruned and the other lightly pruned, will show that the former has thrown off all its parasitical growth, and that the circulation of the bush has been restored—always provided that time is given for the bush to grow up again after the operation. Again, why should planters think that the growth of wood and leaf is an effort to the bush? It is indeed an effort, as it is to us to walk and run and eat. But such efforts are surely not injurious. No doubt, the ideal condition for a tea bush would be to grow unchecked. But, as we are continually checking the flow of sap by plucking, thereby causing the sap to be dissipated into many more channels than nature ever intended, so we must periodically concentrate the sap into a reasonable number of stems if we wish the circulation of the tree to flow unimpeded, and the harder the wood and the sicklier the tree, the fewer should be the channels in which the sap flows. I have for five or six years been experimenting in collar-pruning, but did not know it by that name or that it was advocated by experts. Badly planted trees have been systematically cut down below the surface, and all crowded lateral roots or redundant top roots removed, so that a new single stem could grow from a single tap root. But, in dealing with a new clearing, "E. H." is quite right in saying that all cutting down and all shaping should be done while the bush is young and adaptable. . . . Another argument for shaping the bush, while it is young: If cutting down is delayed until the bush from age, or bad treatment, has become hard and side-bound, a certain proportion will either completely die out or suffer more or less temporarily from dry rot; though the dry rot can generally be removed at the next pruning.

INDIAN AFFAIRS.

The Artificial Rupee as a Bounty against Indian Produce.

The *Times* writes:—The forthcoming instalment of evidence taken by the Currency Committee revives the question as to how far the artificially enhanced rupee acts as a bounty against Indian producers. Accurate thinkers limit the field of the enquiry to Indian produce which has to compete with the produce of rival silver-using countries. They also confine it to the special circumstances called into existence by the Government of India's artificial enhancement of the rupee, while the currency or medium of exchange in competing silver countries has been left to its natural course. It is not the rise or fall of exchange in accordance with natural causes that forms the basis of the alleged bounty against Indian produce. Whether such a rise or fall in the gold value of the rupee acts as an advantage or a disadvantage to India has, indeed, been keenly debated; and not less keenly as to how far the fall was due to an appreciation in gold and how far to a depreciation in silver. But the fall in silver proceeded from general causes, and was shared alike by India and the other silver-currency countries with which her produce competes. The fall gave no advantage to China as against India or to India against China; if the one gained or lost, so did the other, and both had equally to accept the results of economic laws.

While confining their contention within these limits, the producers in India are aware that the question as to an advantage to India from the previous general fall in the gold value of silver has been urged. But they deny its relevancy to the special situation created by the artificial enhancement of the gold value of the rupee, while the medium of exchange in competing silver countries has continued to decline in gold value under the operation of natural causes. Even if it were relevant, they are content, from the present point of view, to accept the deliberate decision of the Gold and Silver Commission in 1888 on this point. (Report, Part II., paragraphs 86, 87.) "We pass on," wrote the Commissioners, "to consider the prejudicial consequences which are alleged to have resulted from the fall in the price of Indian produce especially of wheat, both by those who attribute this fall to the appreciation of gold and by those who connect it directly with the fall in the gold price of silver. It is asserted that its effect has been to create a bounty upon the production of wheat in India, and thus to act prejudicially upon other wheat-producing countries. We do not think the term bounty is in any view properly applicable. . . . At the same time it must be admitted that the Indian producer is for the time in a somewhat more favourable position than his English competitor." The Indian producers maintain that the present situation is not one of mere advantage or disadvantage arising from natural causes of universal application, which carry with them the elements of natural readjustments, but that it is a case of an artificial bounty, created by the artificial enhancement of the rupee, and that it acts as a bounty in favour of silver-using countries whose currency or silver medium has not been tampered with. When, therefore, Lord Farrer asks in our columns, "What amount of bounty" did the previous fall in the rupee give the Indian producers, they would refer him to the Commission's report, signed by himself in 1888, that "we do not think the term bounty is in any view properly applicable" to India in the case of a fall arising out of general economic causes, and shared in common by India and the competing silver countries of the world.

If we pass from general considerations to the actual operation of the bounty against India in favour of competing silver countries, created by the artificial enhancement of the rupee, the nature of the Indian exporters' contention becomes still clearer. Lord Farrer mentioned the tea industry in particular. It is not claimed that the tea industry, or any other British industry in India, deserves exceptional consideration. All Indian industries which have to compete with silver-using countries must, it is argued, sooner or later suffer, when to the pinch of bad seasons or dull business is added the handicap of a currency bounty. But the tea industry will serve as well as another to show how the bounty acts, or is supposed to act. Broadly speaking, tea is produced, whether by India or China, in silver currency and paid for in gold currency. Down to the closing of the Indian mints in 1893 India and China competed on equal terms so far as the currency was concerned. By that time Indian tea had pretty well driven China tea out of the British market, and reduced the British consumption of Chinese teas from 114 million of pounds in 1882 to 36 millions in 1893. The first struggle was for the British market, and India and Ceylon found their energies taxed to the utmost to secure it. One thing at a time. But while Indian tea had thus captured the British market, the other countries of the world used for the most part China tea. During recent years the Indian and Ceylon planters have at a heavy expense done their utmost to invade these outside markets, and in a fair confidence of success they went on increasing their area under cultivation. On their ability to oust China tea from the markets of the world, as they have already ousted it from the British market, depends the future of the tea industry in India and Ceylon. It is a neck-to-neck competition. The Indian and Ceylon planters know that they can win in quality. The only question has been one of price, and hitherto they have been able to hold their own in that respect also. Let us see how, according to the representatives of the tea interest, the artificial rupee intervenes at this critical moment and acts on the decisive question of price.

For a sovereign's worth of tea India receives back 15 artificial rupees. For a sovereign's worth of tea China gets an amount of silver equal in weight and fineness to $22\frac{6}{7}$ rupees. "The difference between 15 and $22\frac{6}{7}$ is about 50 per cent.," runs the latest tea circular of Messrs. Gow, Wilson and Stanton. "In other words, the gold

which the Chinese trader obtains in Europe by the sale of his goods returns in silver coin about 50 per cent. in excess of what it does in India and Ceylon." This is the calculation by trade experts of the highest authority in England. But neither they nor the tea-planters believe that the bounty against Indian and in favour of China tea actually operates to the extent of 50 per cent. For although both in China and in India tea is produced by a silver currency, yet a number of secondary causes come into play. Thus the cost of producing Indian tea, although chiefly paid in silver wages, is to some extent made up of payments for machinery and European appliances of manufacture. But, allowing for all such deductions, careful investigators maintain that the artificial enhancement of the rupee acts as a bounty against Indian tea in the struggle with Chinese tea for the non-British markets of the world to something near 25 per cent., though they seem in their calculations to take no account of the higher purchasing power which the artificial rupee may be assumed to have in India merely because it is artificial.

As a matter of fact, the progress made in ousting China from the markets of the world, under the partial operation of the artificial rupee, although steady and even rapid, if we merely look to the size of the figures, has been disappointing to the sanguine people engaged in the work compared with the capture of the British market from China under the operation of the rupee at its natural value. In the largest field—the United States—hopes have not been realised, and the struggle is at this moment reaching its acute stage. It would be wrong, however, to over-estimate the effect of the currency-bounty in this respect. For that bounty is only now making itself severely felt, with the awakening of China to new life, and the rupee artificially forced up to 1*s.* 4*d.* It is correct, however, to say that the partial bounty, for some time in force, has tended to retard the extension of Indian tea as against the low-priced Chinese article. But it is rather the effect of the full bounty, with a permanent rupee at 1*s.* 4*d.* against the Chinese equivalent of the rupee at 10*d.*, to which the Indian producers look with fear. Probably sufficient account has not been taken of the rise in nominal wages which is sure to take place in China sooner or later. In time the Chinese labourer will discover that he is not receiving as much real wages as he formerly did. But it must not be forgotten that China possesses every variety of soil and climate suited for tea. Bad manufacture by the hand-process is what stands in her way, and the Consular reports show that she is taking steps to introduce the Indian system. Experiments with a machine-roller last season "proved beyond doubt," says the Shanghai trade report just issued, "that the most ordinary China tea is capable of astonishing improvements if treated by modern methods." Companies are being formed, and British capital is already aware of a new field for employment. While the Indian planter has had to struggle by lower prices to compete with the "bounty fed" China tea, Russian buyers in China have this season purchased considerably in excess and at better prices than last year. Han-kau telegrams reported that, of the first crop, Russia took 440,000 half-chests against 330,000 half-chests last season. "The prices paid for common grades are reported as much higher, and have been taken principally for Russia." A later telegram announces that the whole of the first crop in China has been settled and that the second crop is being dealt with at relatively as good prices.

Such isolated pieces of evidence are, however, of small impor compared with the general conviction of Indian producers that attempts to compete with China in the non-British markets o world are now heavily handicapped. On this conviction the En investor and the Indian planter are now taking practical ac The extension of the tea acreage in India during late years was warranted on the assumption that Indian tea can oust China the non-British markets of the world as it has ousted China the British market. But grave doubts are now felt as to wh this will be possible with the bounty created by the artificial r against India. The expectation of large new markets has shaken, and investors and planters are alike aware that it was expectations that conduced to the extension of tea-growing in I If they can be realised, the Indian tea industry is safe. If they not be realised, while the capitalist will suffer much, the coolie labourer and Indian employé will suffer still more.

THE STUDY OF FOLK-LORE IN INDIA.

MR. H. H. RISLEY, President of the Asiatic Socie Bengal, has issued a circular, from which we quote following :—

In 1891-92 a scheme for promoting the systematic study of e graphy in India, which had been prepared in consultation wit late Professor Robertson Smith and Mr. J. G. Frazer, was circu by the Government of India, and the suggestion was made Societies formed for scientific inquiries might undertake to c information sent to them. In connexion with this scheme Asiatic Society of Bengal added to their journal a third section ing with Anthropology, Ethnologoy and Folk-lore, and underto edit and publish suitable papers on these subjects. The numb papers received has, however, not been very large, and exper has shown that further organization is needed if any real pro is to be made towards the end in view. It is not enough mere invite those interested in the religious and social customs o people of India to send in for publication any information they obtain. Inquiry must be stimulated by indicating in some the manner in which it should be conducted, and simplifie directed by stating the form in which its results should be rec

The Council of the Society have accordingly resolved to cir widely the annexed set of questions which has been drawn my request by Mr. William Crooke, late of the Indian Service, the author of *The Popular Religion and Folk-L Northern India.* If persons interested in the subject will c replies to the questions and send them to the Anthropol Secretary of the Society in the form of papers or notes dealing a particular custom, belief or superstition, they will be publish the third part of the journal. It is hoped that in course of sufficient information may thus be collected to form the basi comparative study of the Folk-lore of different parts of India.

A few words of explanation may be added. Folk-lore has defined by the English Folk-lore Society as "the compariso identification of the survivals of archaic beliefs, customs and tions in modern ages." The definition marks the distinction be

[w.—8-9-98—t.f.o.]

Folk-lore and the allied studies of ethnography, ethnology and anthropology, none of which are exclusively concerned with survivals. But the term 'survival,' which is of the essence of the definition, is itself relative, and in considering how researches into Folk-lore should be conducted in India, two points must be borne in mind. First, that in relation to European institutions nearly the whole body of Indian custom, usage and tradition may be regarded as a series of survivals. Secondly, that within this series are to be found usages of different age and origin, some of which may have survived or been adopted from Non-Aryan sources. The latter have, as is well known, a tendency to decline in popular estimation, and either to disappear or to be so transformed that their origin can no longer be traced. Of recent years this tendency has been increased by the spread of education and the extension of railways. It should, therefore, be one of the chief objects of the inquiry now suggested to ascertain and record the more primitive customs and to endeavour to distinguish them from those which are believed to be of Aryan origin. Particular attention should be given to those customs and beliefs which are handed down orally and are not recorded in writing.

The list of questions given is formidable, and we hesitate to allot to a subject of this kind the space that the whole list would occupy. On certain points, however, planters might give very valuable information, and we trust that some of our friends will have the kindness to deal with the following questions selected from Mr. Crooke's list :—

I.—Nature Powers.

Give any current beliefs about sun worship. How and at what periodical feasts is the worship conducted and what form of ritual is adopted?

Give any legends or customs connected with moon worship: the spots on the surface of the moon: the moon as a healer of disease: the custom of drinking the moon's rays: any ceremonies at new or full moon.

Give any legends and rites connected with eclipses.

Similarly for star worship; superstitions connected with the rainbow; the milky way.

Rites connected with worship of the earth mother: sacred things not to fall on earth: occasions when people sleep on the earth.

Superstitions connected with thunder and lightning.

Popular belief regarding earthquakes.

Collect instances of and ritual for worship of sacred rivers; springs; waterfalls; water spirits and goblins: prejudice against saving drowning people: ceremonies at digging and dedication of wells: well water as a cure for disease: instances of sacred lakes: palaces under the water.

Instances of sacred mountains and legends connected with them: dread of climbing mountains.

Name any deities supposed to control the weather, and describe the modes of causing or averting rain, of checking storms and hail.

Are there any sacred stones which are believed to influence the rain?

Note any superstitions in connection with aërolites and meteors.

II.—The Heroic Godlings.

How is the local deity of a new settlement selected and installed?

What local deity is considered responsible for crops and cattle? When and how is he worshipped?

III.—Disease Deities.

Describe the worship of any deities who are believed to have the power of averting or causing disease, such as cholera, small-pox, fever, etc.

Is epidemic disease attributed to witchcraft, and, if so, what precautions are taken? Give particulars of observances in connection with cattle disease.

What methods are in vogue for the exorcism of disease? Give examples of any rural charms used for this purpose.

IV.—The Worship of Ancestors and Saints.

Give instances of worship of ancestors: the belief that spirits are mortal and that the spirits of the dead are re-born in children.

V.—The Worship of the Malevolent Dead.

Is it considered possible for the soul to leave the body temporarily? If so, give instances.

What is the popular conception of the character and functions of the Bhút or disembodied soul?

Does any special class of evil spirit infest mountains, jungles, trees?

VI.—The Evil Eye and the Scaring of Ghosts.

Describe the belief in the evil eye and the modes of evading it.

Does the belief in giving opprobrious names to children prevail, and if so, how is it accounted for?

Illustrate the belief in tree spirits.

What spirits are special protectors of crops and cattle?

VII.—Tree and Serpent Worship.

Name any sacred groves in your neighbourhood and describe any prejudice against cutting trees?

Are any trees specially connected with any local deity or saint?

Name any trees which receive particular respect or devotion, and note any legends or superstitions in connection with them.

Does the custom of marrying a bride or bridegroom to a tree prevail? Any instances of marriage to a god: religious prostitution?

Give instances of snake worship and shrines of serpent deities: of deified snake heroes.

VIII.—Totemism and Fetishism.

Can you quote any beliefs which are suggestive of Totemism? Are any clans named after or do they claim descent from animals or plants? What animals are treated with special respect by particular tribes? Do special castes refuse to eat any special food?

Are any local deities specially associated with animal worship?

Illustrate the worship of stocks and stones. Is any respect shown to perforated stones?

Is special respect shown to the corn sieve, the winnowing basket, the broom, the rice pounder, the plough?

IX.—Animal Worship.

Illustrate from local examples the worship or respect paid to the horse, ass, lion, tiger, dog, goat, cow, buffalo, antelope, elephant, cat, rat and mouse, squirrel, bear, jackal, hare, crow, fowl, dove and pigeon, swan, and other birds, alligators, fish and insects, and give any legend or superstition in connection with them.

X.—Witchcraft.

How far does the belief in witches and their powers prevail? Do they appear as animals and have they special haunts and seasons?

What ordeals are used to test a witch and what means to guard against her witchcraft?

XI.—General.

Describe the rural ceremonies in connection with ploughing, sowing the various crops, reaping and harvesting.

Rites intended for the protection of cattle: to ensure sunshine and favourable weather: to scare noxious animals or insects: to protect special crops: illustrate these from local custom.

Are there any rites in which secrecy and silence are essential?

Describe the observances at the Holi.

Give details of any rites performed when boys or girls attain puberty.

DISTRICT ASSOCIATION.

KANAN DEVAN PLANTERS' ASSOCIATION.

Minutes of a Quarterly General Meeting held at Munnar on 27th August, 1898.

Present.—Messrs. H. S. Buist, R. Hedger, A. H. Mead, R. F. Russell, W. D. Martin, J. Sealy, Dr. G. L. Kerr, G. N. Thomson, J. Hamilton Hunter, W. Milne, H. M. Knight, A. D. Cameron, Baron J. vonRosenberg (*Chairman*), A. H. Sharp (*Hon. Sec.*), J. A. Hunter, C. Burn Murdoch.

Notice calling the meeting was taken as read.

Read and *confirmed* minutes of last meeting.

Kotagudi Ghat Road.

Read letter from Messrs. Finlay, Muir and Co., Calcutta, stating that they had agreed to pay one-fourth of the cost of the Bodinaiakanur-Kotagudi Road. *Recorded.*

Bodinaiakanur Bungalow.

Proposed by Mr. Knight, and *seconded* by Mr. Milne, that the Association do agree to take over the land bought by the Committee through Mr. Davidson and pay the cost of the bungalow and outbuildings. That the land on which the store belonging to the Kanan Devan Mills Produce Co., Ld., stands be leased to the Company at a rent of Rs.50 per annum in perpetuity, and that Messrs. Finlay, Muir & Co. be asked to hold the land as trustees for the benefit of the Kanan Devan Planters' Association. *Carried.*

Proposed by Mr. Knight, and *seconded* by Mr. Sharp, that the land

and buildings belonging to the Association at Bodinaiakanur be offered to the members not belonging to the Kanan Devan Mills Produce Co., Ld., at an upset price of Rs.1,000. *Carried.*

Proposed by Baron von Rosenberg that the cost of erection of the bungalow and purchase of land be raised by an assessment on cleared acreage. *Seconded* by Mr. Hedger and *carried.*

TELEGRAPH STATION.

Read letter from Messrs. Finlay, Muir & Co., Calcutta, stating that they had given the guarantee of Rs.2,230 per annum for a period of five years to include the two Telegraph Stations at Devikulam and Munnar.

Proposed by Mr. Sharp, and *seconded* by Mr. Knight, that this Association confirms this guarantee. *Carried.*

PERIAKANAL ARRACK SHOP.

Proposed by Mr. Thomson, and *seconded* by Mr. Knight, that this Association considers it desirable to have the Arrack Shop at Periakanal closed on account of its isolated position and the temptation it offers to transport coolies between Bodinaiakanur and Munnar wasting time there, and the drunken rows that frequently occur there. *Carried.*

MEDICAL GRANT.

Proposed by Mr. Knight, and *seconded* by Mr. Sharp, that the present medical grant from Government be equally divided between the dispensaries at Munnar, Sothapara, Yellapathi and Periakanal. Dispensaries to be in charge of the Superintendent of the estate on which the dispensary is situated, who will keep all necessary records. *Carried.*

Proposed by Mr. Knight, and *seconded* by Mr. J. Hamilton Hunter, that the rates at which rice is issued to coolies in different parts of the district be ruled by the Association. That 14 annas be the maximum weekly issue to a male adult for six days' work on check-roll and 10 annas for women. To be proportionally reduced for fewer days' work. This, however, does not apply to coolies free of debt. *Carried.*

Proposed by Mr. Knight, and *seconded* by Mr. Milne, that a Plague Committee be appointed consisting of Messrs. Hickey, J. A. Hunter, G. N. Thomson, Dr. Kerr and the District Magistrate.

Papers laid on the table:—

No. 494 / 25-6-98, District Board, Madura, *re* Bodi Ghat Road.

No. 3041 C / 2-7-98, Public Works Department, Madras, *re* Talliar-Chinnar Road.

Report of the President, District Board, Madura, on the insanitary condition of Bodinaiakanur.

Letter from Assistant Superintendent of Police, Kottayam.

The meeting closed with a vote of thanks to the Chair.

A. H. SHARP,
Honorary Secretary.

MARKET REPORT.

COFFEE.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the Fortnight ending August 17th, 1898, says:—The improved demand reported in our last has been maintained throughout the past week, and values of all kinds have ruled very steady, colory Colombian and Plantation Ceylon being again dearer. The small quantity of Neilgherry offered sold with difficulty at about steady prices.

Futures close very steady, about 3d. lower, after fluctuations, viz.:—Good average Santos in Havre, September delivery, fcs. 37.00, in Hamburg pf. 30½, and No. 7 low ordinary Rio in New York $5.55.

To-day's London official quotations are:—

	Sept.	Oct.	Dec.	Mar., '99.	May.
SANTOS ...	29/9	30/–	30/6	31/3	31/9

We quote:—

Ceylon, mid. to good mid.	101/	@108/	
Do. small to low mid.	79/	„ 99/	
East India, mid. to good mid...	70/	„ 92/	
Do. small to low mid.	58/	„ 72/	
Guatemala, mid. to fine...	66/	„ 98/

Do. mid. to fine...	64/	„ 98/	

Receipts in Brazil to 17th August compare as follows with pre years:—

	1898-99.	1897-98.	1896-97
	Bags.	Bags.	Bags.
RIO	427,000	696,000	530,000
SANTOS	851,000	1,121,000	817,000
	1,278,000	1,817,000	1,347,000

Messrs. R. J. Rouse & Co say on their Weekly Coffee Report (Augus 1898)—Large supplies at auction consisting chiefly of Central Ame kinds met with a better demand, medium qualities realising fi rates, while desirable and colory kinds sold at an advance of a 1/- to 3/- per cwt.

Plantation Ceylon sold freely at full prices.

About 300 bags East India, chiefly ordinary faded, were catalogue sold at previous rates.

Futures.—The deficiency in the receipts at the Brazilian ports conti to increase and now amounts to over 550,000 bags since the begin of the season, compared with the same period last year. This, toge with the firm attitude maintained by the Brazilians, has imported a b tone to the market, and prices are rather dearer.

From London advices of 19th ultimo we gather the following:—

Of Coffee supplies have continued restricted, and have consisted al entirely of Central American descriptions, chiefly unattractive qua but with a good steady demand nearly everything offered has disposed of at firm prices to an occasional advance of 1s. per cwt. coloury Coffees are again rather dearer, and Plantation Ceylon has readily at extreme rates. "Futures" are again rather dearer; average Santos is quoted at 29s. 9d. for August, 30s. September, 30s October, and 31s. 6d. March.

In East India there has been rather more enquiry privately. Jan remains neglected. Futures have been steady, and prices close wit material alteration, except for distant positions which have adva owing to estimates of the new crop being from 25 to 30 per cent. l than the current one; closing rates are:—

London	...Santos	...September delivery	...	30s. 0d.
New York	...No. 7 Rio	... „	„ ...	5.55 cents.
Hamburg	...Santos	... „	„ ...	31 pf.
Havre	...Santos	... „	„ ...	37¾ francs.
Holland	...Good ordinary Java	...	...	37¼ cents.

Imports Deliveries and Stock of Coffee in London are as follows:—

		STOCK.		IMPORTS.

PEPPER.

London advices dated 19th August, 1898, state:—

Black.—The market is firm but quiet, and business has been limited this week. About 200 tons have been sold—at $4\frac{13}{16}$d for fair on the spot, at 5d for July-September shipment, and $5\frac{1}{16}$d to $5\frac{1}{8}$d September-November.

The shipments of Black Pepper for the first half of August compare as follows:—

		1898.		1897.
U.K.—Singapore	340	340	250	250
,, Penang	*nil*		*nil*	
Continent		100		140
U.S.		225		20
Total tons...		665		410

At auction on the 17th inst. only 25 bags good fair brown Tellicherry were offered, and these sold at $4\frac{1}{2}$d per lb.

White is also firm but quiet. 100 tons have been sold, including Singapore September-November and October-December shipment at $8\frac{15}{16}$d, Penang on the spot at $7\frac{1}{2}$d to $7\frac{3}{4}$d, October-December shipment at 8d, and November-January at $8\frac{1}{16}$d.

The shipments of White Pepper for the first half of August compare as follows:—

		1898.		1897.
U.K.—Singapore	300	370	60	80
,, Penang	70		20	
Continent		50		*nil*
Total tons...		420		80

At public sale on Wednesday 32 bags Singapore sold—fine $9\frac{1}{4}$d to $9\frac{3}{8}$d, good brownish mixed small $8\frac{3}{4}$d. 15 bags fair Penang realised $7\frac{11}{16}$d. 7 bags Ceylon retired at 9d per lb.

August 19.—Black quiet and sales unimportant. Singapore Sept.-Nov. shipment $5\frac{1}{8}$d sellers.

Of White 40 tons Penang Oct.-Nov. and Nov.-Jan. shipment sold at $7\frac{7}{8}$d per lb.

BOARD OF TRADE RETURNS.

The following tables shew the Imports, Consumption, and Exports of the undermentioned articles for the seven months ending 31st July in the present and two previous years, compiled from the Board of Trade Returns, with stock in U.K. on 31st July:—

CINCHONA.

The Monthly Public Sales of Bark.

Auctions on Tuesday the 16th ultimo summed to 1,819 packages, distributed among nine catalogues. For all, except the South American, there was a very good demand, and the bulk of the offerings found buyers at last sales' rates, the unit value again averaging about $\frac{15}{16}$d.

Of *South American*, 482 bales were catalogued and 250 bales sold—Bolivian cultivated Calisaya quill $4\frac{1}{4}$d to 6d, flat country-damaged 5d per lb.

Of 117 bales *Ceylon Cinchona* offered 90 bales sold—Succirubra, chips $1\frac{3}{4}$d to $2\frac{1}{8}$d, ditto renewed $2\frac{1}{4}$d to 3d per lb.

Of 983 packages *East India Cinchona* brought forward about 660 pkgs. sold—Officinalis, quilly chips $4\frac{1}{2}$d to $5\frac{1}{4}$d, chips and shavings $1\frac{1}{2}$d to $2\frac{5}{4}$d, ditto renewed $2\frac{3}{4}$d to $4\frac{1}{2}$d; Red, chips and shavings $2\frac{1}{4}$d to $2\frac{3}{4}$d, ditto renewed $2\frac{1}{4}$d to $2\frac{3}{4}$d, broken quill $2\frac{3}{8}$d to $3\frac{5}{8}$d, root $4\frac{3}{8}$d; Ledgeriana, chips $3\frac{1}{2}$d to 5d, branch $2\frac{3}{4}$d per lb.

132 bags *Java Cinchona* sold—Ledgeriana, chips $3\frac{1}{2}$d, chips and root $2\frac{1}{2}$d to $2\frac{3}{4}$d, branch $2\frac{1}{2}$d to $2\frac{3}{4}$d per lb.

102 bales *African Cinchona* sold—Succirubra, quill and chips $3\frac{3}{4}$d to 4d per lb.

QUININE.

London advices of 19th ultimo state:—

SULPHATE OF QUININE is lower, with sales of HB or B&S at $9\frac{3}{4}$d per oz.

CARDAMOMS.

At the auctions in London on 18th ult. a good supply of Cardamoms was brought forward and a fair clearance effected; the few "stand out" lots realised over valuations, whilst the dull bold, medium and small qualities were about 2d to 3d per lb. cheaper.

Catalogues offered 367 cases, of which 280 cases found buyers as follows:—Mysore @ Ceylon, extra fine bold pale plump bleached 4s 1d, bold 3s 4d to 3s 5d, medium 2s 11d to 3s 2d, and small 2s 8d; extra bold palish 3s 5d to 3s 6d, bold 2s 10d to 3s 1d, medium 2s 4d to 2s 7d, smalls 2s to 2s 4d; bold plump round pale 3s 1d to 3s 2d, medium 2s 4d to 2s 6d, small 2s 1d; bold long lean 2s 8d, medium ditto 1s 10d; good bold brownish 2s 7d to 2s 8d, medium 2s 3d, very small 1s 11d; medium bold palish 2s 5d to 2s 6d, medium 2s 4d; dull bold and medium lean, slightly mouldy, 2s 3d to 2s 4d, small and medium 2s; Malabar @ Ceylon, ordinary brown and lean 2s; open pickings 2s 7d for fine, 1s 11d to 2s 2d for good, and 1s 6d to 1s 8d for common; seeds, fair 2s 10d, ordinary 2s 7d, odd lots 2s per lb.

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Report, dated August 12th, 1898, says :—

Ceylon ...	6,597,202	6,065,701	4,512,202	3,968,709

Indian. Auctions comprised 26,643 packages, a sufficient quantity to afford some test of the strength of the market. Demand was good for all descriptions, while anything with special point in liquor commanded rather better prices. High class Teas sold with strong demand, especially some of improved quality from Assam and Darjeeling.

Ceylon. The auction of 41,210 packages was slightly less than the corresponding sale after the Bank Holiday last year. The fortnight's interval has resulted in strengthening the demand, prices for all grades being fully maintained with a distinctly firmer tendency.

The new plan of dividing large sales between Tuesday and Wednesday came into operation this week for the first time and worked admirably. Although 1,296 breaks were represented, buyers had time to give thorough attention to the various samples. Averages :—"Associated T. Co., Silver Kandy," Dimbula Valley D," and "Holmwood," 1/–.

Average for the week is 7·44*d.*, against rather under 7½*d.* last year.

Java. 1,437 packages were brought forward, all of direct import, the Teas being nearly all sold in the room at steady prices. 106 packages from "Perbawattee" averaged 10¼*d.* per lb.

THE AUSTRALIAN MARKET.

Australian advices dated 12th August report as follows :—

SYDNEY.—Private cables have been received from Colombo to the effect that the market there has advanced 7½ per cent. This caused some excitement among teamen, and there was no disposition to unload stocks of Ceylon leaf, which by the way are not heavy just at present. Twenty half chests of Ceylon broken pekoe sold at 7½d. Chinas moved off slowly at market rates.

MELBOURNE.—A catalogue of 341 chests and 86 half-chests Ceylon ex "Arcadia," was offered at auction this afternoon. There was a demand at firm prices, and the common grades especially sold Sales amounted to 309 chests and 61 half-chests, as follows :—Br orange pekoe, 10½d. ; orange pekoe, 8d. ; broken pekoe, 103 chests, at to 8d. ; pekoe, 70 chests, at 6d. to 6½d. ; pekoe souchong, 94 chests a half-chests, at 5¼d. to 7¼d. ; fannings, at 4d. to 5¾d. ; and dust, at Privately the sales which have been made include 150 packages Ceylo 6d. to 7d. There is a very good demand for common teas.

ADELAIDE.—Sales of Ceylon teas have been making pretty freely, the parcels are small.

Messrs. Alfred Harvey & Co state in their Monthly Tea Report, d Melbourne, August 17th :—

GENERAL.

Shipments from all ports are 7,960,000 lb., as against 7,927,253 lb same time last year.

The *Orissa* from Calcutta is due now, although the quantity shi for this market is only 48,000 lb.

Latest advices show that there has been more active buying Australia ; we, therefore, expect a good assortment within the next t weeks.

Ceylons have continued to be well represented, and the demand gr stronger. Prices have been full in consequence ; more especially extreme rates paid for all the lower grades. The selection has been varied, a lot of the better teas proving very attractive.

There is no improvement in the scented market, Kooloos remai unchanged, and scented orange pekoes are sold at rates that prove u unsatisfactory to importers. The market closes very strong for all up to 6½d., with a good demand for almost all grades.

Stocks in bond on the 6th August were 1,241,485 lb.

CEYLON.

Shipments from Colombo are 5,000,000 lb., as against 4,000,000 lb same time last year.

With the exception of one catalogue printed on the 12th instant, whole of the arrivals have been sold privately. At auction, dust, fannings sold at 4d. to 4½d. ; fine quality, 5½d. ; common red leaf chongs, 5¼d. to 5½d. ; rough leaf pekoe souchong, 5¾d. to 6¾d. ; fine pekoes, 6½d. to 7½d. ; fine to choice quality, 8d. to 10½d. These pr show a distinctly quotable advance of from ¼d. to ½d. per lb. upon month's rates. The weight of leaf on the water is reported to be hea than usual.

Stocks in bond on the 6th August were 396,884 lb.

CALCUTTA SALES.

Messrs. W. S. Cresswell and Co's Tea Report, dated Friday, Septembe says :—

At to-day's sales 21,066 packages were catalogued, out of which 1, were withdrawn for higher prices, and 542 did not arrive in time for s

The quality of the teas generally on offer was again poor, and in onl very few instances could improvement be traced against last invoices so some of the Assams, however, were of slightly better quality, and all p sessing this qualification were keenly competed for.

Teas from Sylhet, Cachar, Duars, and Darjeeling were decidedly poor, all low medium grades again showed an easier tendency.

The Darjeelings catalogued lacked point and flavour, and in most instan were withdrawn form sale owing to the prices bid being below sell limits.

Common leaf grades were firm, and bidding was brisk at about sale's rates.

Exchange—Closes at 1/4-3/32.

OLD TEA LEAVES.

A RECENT writer in a Colombo contemporary has erred in his attempt to state the time when, "according to old record," the introduction of Tea into England "appears to have taken place." He states that this was in 1666, when Lord ARLINGTON and Lord OSSORY brought over a small quantity from Holland, and the custom of drinking it became "fashionable." The date here given is, however, some years too late, for good old PEPYS jotted down in his diary on 25th September, 1660:—"I did send for a cup of *tee* (a China drink, of which I had never drank before)." In the same year, too, by Act II. of Charles II., chh. 23 and 24, a duty of 18*d.* was imposed on every gallon of chocolate, sherbet, and tea, made for sale; coffee being charged only 4*d.* In 1664 the East India Company purchased 2lb. of tea and presented it to the King, and in 1666 a larger present of $23\frac{2}{3}$lb. was made. An old shop bill, quoted by the writer already referred to, proves that tea dates further back into the past than 1666. THOMAS GALWAY, of Exchange Alley, tobacconist and coffee man,

claimed to have been the first to retail tea, and in his shop bill we find this statement :—"Tea in England have been sold in the leaf for six pounds, and sometimes for ten pounds the pound weight, and in respect of its former scarceness and dearness have been only used as a regalia in high treatments and entertainments, and presents made thereof to princes and grandies till the year 1657. The said GALWAY did purchase a quantity thereof, and first publicly sold the said tea in *leaf* or *drink* made according to the directions of the most knowing merchants in those Eastern countries. On the knowledge of the said GALWAY's continued care and industry in obtaining the best tea and making drink thereof, very many noblemen, physicians, merchants, etc., have ever since sent to him for the said leaf, and daily resort to his house to drink the drink thereof. He sells tea from 16*s.* to 50*s.* a pound." This brings us back to 1657, therefore, and from PEPYS' note, and the taxation imposed in 1660, it is safe to assume that tea had already begun to become fashionable by that time. That a present of this herb was highly esteemed as long ago as 1664 is shown by the following extract from the earlier "Court Books" of the old East India Company:—"22*nd August* 1664.—The Governour acquainting ye Court that ye Factors haveing in every place failed ye Company of such things as they writt for to have presented his majestie with and that his matie might not finde himself wholly neglected by ye Company he was of opinion if ye Court thinck fitt that a silver case of oile of cinnamon which is to be had of Mr. Thomas Winter for £75, and some good Thea, be provided for that end, which he hopes may be acceptable, ye Court approved very well thereof." This entry refers to the present of 2lb. of tea made to CHARLES II. in 1664. Then on 3rd July, 1666 :—"The Court now left itt to the governour and deputie to dispose of the value of about £10 in Thea to some gentlemen where they see reason to place itt." And advancing some years, we find the Directors writing to Madras on 13th February, 1684/5 :—"In regard Thea is grown to be a commoditie here, and we have occasion to make presents therein to our great friends at Court, we would have you send us yearly five or six canisters of the very best and freshest Thea; that which will colour the water in which it is infused most of a greenish complexion is generally best accepted." The first importation *from Holland* is reported to have occurred in 1666, while the Company's first importations of tea, direct from Bantam, are said to have been received in 1669. In 1671, it may be observed, the stock of "Thea" held by JOHN COMPANY was valued at 20*s.* per lb. The earliest mention of Tea in the East India Company's records is made in a letter from RICHARD WICKHAM, the Company's Factor at Firando, in a letter dated 27th June, 1615, to Mr. EATON at Miaco. He asks for "a pot of the best sort of chaw."

That Tea was in good demand in the first century of its introduction into England, is very clear. It sold at times at 60*s.* a pound, and we find it recorded that the Swedish Company, which obtained a charter in 1731, "was supported chiefly by smuggling tea" into Great Britain, until the British Parliament in 1784 lowered the tax on tea, when the Swedish Company was immediately annihilated. In 1771 it was stated that the Duke of NORTHUMBERLAND had a tea-tree in full flower—the first that ever flowered in Europe. It was then remarked :—"This shrub grows from cuttings like a willow, and probably it will prove hardy enough for the open air with us; if so, as it is a very quick grower, we may soon have tea of our own production, and save so our silver." These hopes were, luckily for India, dest to be disappointed. It was asserted about that time no tea-plants had yet died in England through excess of but writing in 1772 an observer remarked :—"An exa of the contrary I know has happened." He added :—" plant in the princess dowager's garden at Kew flouri under glass-windows, with the natural heat of the su well as those at Mile-end in the possession of the indefa ble J. Gordon. Two of the tea-plants belonging to Fothergill thrive in his garden at Upton, exposed to open air in Summer."

Even in those early days, too, tales had got about Tea was harmful to the health of the drinker. Among old leaves in our pot we find these :—"The long and stant use, as a part of our diet, makes us forget to enq whether it is possessed of any medicinal qualities." " generality of healthy persons find themselves not appare affected by the use of tea. It seems to them a gra refreshment, both fitting them for labour and refres them after it. There are instances of persons who drunk it from their infancy to old age; have led, at same time, active, if not laborious lives; and who n perceived from the constant use of it any ill-effect, nor any complaint which they could ascribe to the effects of liquor." But the critic thought this was due to the stre of the drinkers rather than the innocence of the tea! S among the less hardy and robust, he says, "complain after a tea-breakfast, they find themselves rather flutte their hands less steady in writing, or any other employ requires an exact command." Others could bear well enough in the morning, but not in the aftern Some after drinking a single dish were "immediately and disordered at the stomach." But it was acknowle by even this harsh critic that "in general the most te and delicate constitutions are most affected by the free of tea." He admitted, too, "that it enlivens, refres exhilerates." The finer the tea, he observed, the obvious are its effects, and in another place we read :—" if not too fine, if not drunk too hot, not in too great q tities, is perhaps preferable to any other vegetable infu we know." He had often regretted, indeed, that tea sh be found to possess any pernicious qualities "as the plea which arises from reflecting how many millions of our fel creatures are enjoying at one hour the same amusing re the occasions it furnishes for agreeable conversation, innocent parties of both sexes it daily draws together, entertains without the aid of spirituous liquors, would af the most grateful sensations to a social breast." So it in 1772, so it is still, and we pick out yet one more which, old though it is, is still fresh. It tells us that " attachment to tea is not merely from its being costl fashionable, but from its superiority in taste and effect most other vegetables." "Old Tea leaves" of that sort always "draw" without any admixture of carbonate of s

MR. ACWORTH ON THE CURRENCY QUESTI

ELSEWHERE we give the text of Mr. G. L. Acwo evidence during his examination before the Indian Curr Committee. This reached us too late to permit of reviewing it, but we note that our contemporary, the *Ma*

ail, thinks that Mr. Acworth "acquitted himself very editably in his representation of planting interests," but at in the supremely important matter of "ways and eans," "his evidence appears to us to be wanting in ecision and force." It is, says our contemporary, "an iom that if the mints are re-opened the increased cost to e State of fulfilling its sterling obligations must be met by creased taxation." According to Mr. Acworth's own owing, in the written statement that he submitted to the ommittee, a loss of about 15 crores would have to be made od. The loss may be more or it may be less, according the gold value of the rupee; but it is hardly likely to be ss than 12 crores in any case. To make up the loss, natever it may be, Mr. Acworth says:—"We producers e prepared to pay by having an export duty (not larger an the amount necessary to recover it) placed on our oduce, provided—(1) That should the rupee rise in value, the export trade increase, which it almost certainly would, e duty should be proportionately reduced. (2) That the ports of Ceylon should be taxed to a like extent."

The *Mail* continues:—"Leaving aside proviso (2), which itself would be likely to present insuperable difficulties, one can hardly suppose that Ceylon would agree to the position of taxation that it could well do without, and xation moreover that would damage it in its competition th other countries, let us examine what Mr. Acworth has say about the export duty in India itself. In his evidence remarks:—'The planters of South India are perfectly lling, should the Government of India find it necessary to ake good the deficit, to submit to an export duty on their oduce in order to make good any deficit there may be. t in saying that, of course, they assume that it would be t on the produce of India in general; I mean on all oduce, wheat, jute, hides, and everything.' It is apparent om Mr. Acworth's evidence that he would have the whole ss made good by an export duty; and he specifically rejects y proposal to increase the import duties. When, however, comes to the *rate* of export duty that would be required is less precise. He speaks, somewhat hesitatingly, as gards tea in particular of 'a very small tax, say 3 per nt.' But as the total value of exported merchandise has eraged about 108 crores for the last few years, it is clear at to make up a deficit of only 12 crores (it might be 15 ores), an export duty on everything at the rate of some-ing like 11 *per cent.* would have to be levied! It can rdly be supposed that the export trade of India would stand crushing impost of that kind. Mr. Acworth's proposed ty of 3 per cent. on tea would therefore be ridiculously t of proportion to the general requirements. It will be ntended, of course, that the export trade would be imulated by low exchange; but even if, despite a crushing post, it doubles in volume (which of course is impossible), e required rate of duty would still be something like 5 or per cent. It is easy enough for planters to say—speaking, ithout authority, on behalf of all producers in India—pen the mints and we will make good the deficit;' but hat is wanted is 'practical politics,'—in a word a clear atement of the incidence and probable yield of the pro-sed extra taxation. So far this has not been given."

It will be interesting to see what planters have now to say on this point. They have an opportunity to supplement their case before the Committee resumes its sittings.

NOTES.

Coffee in London. Latest reports show that with only moderate prices offering fair prices had been realised for desirable qualities. The feature of the week was the speculative demand for "futures," which advanced further 2*s.* per cwt.

Business or Occupation? A Ceylon planter avers that in Northern India tea-planting is a *business*, here in the majority of cases it is an *occupation*; and there is a vast difference between the two. What is it in the *South* of India?

Ceylon Coffee!! Writing from Haputale a correspondent says:—"Fair blossoms up here, and prospects for next coffee crop much better than last year." We (*Times of Ceylon*) hear the same from Badulla, where there yet remains a little coffee.

Calcutta Tea Sales. At the tea sales on 9th instant 15,700 packages were sold. In spite of a smaller quantity offering, the market was again weaker for all descriptions, except leafy kinds for price, which were firm and occasionally dearer. Bombay buyers were small operators, and the price of common pekoes showed a further decline.

Tea in Java. Thus the *Ceylon Observer*:—Mr. A. E. Wright has had a very pleasant trip to Java on the present occasion, and he has been impressed with the goodness of the tea, generally in the rich soil of that country. Java tea planters are becoming very particular about jât and factories with the best machinery are becoming available. So let intending planters of more tea——beware!

Sales of Tea in Colombo. At the public sale on 7th instant Commerce Room, 6,923 pkgs. = 551,624 lb. were offered, of which 5,324 pkgs. = 403,576 lb. were sold. The sale passed with a very flagging tone, but without alteration in prices, this no doubt being accounted for by the absence of freights. All standout teas met with keen competition. The finest teas in the sale were: Glassaugh, Agra Ouvah, Glasgow, Glentilt, High Forest, Middleton, and Columbia. Among the low-grown invoices, some of the best were: Farnham, Erracht, and Murraythwaite. The quantity to be offered on Wednesday, the 14th instant, was put down at 796,690 lb.

Tea in London. The latest market report by mail from Home may be summarised thus:—Of Indian tea the supply consisted mostly of unattractive descriptions, for which previous prices were not in all cases maintained; the best liquoring sorts, however, met with good competition and realised high rates. For Ceylon tea the biddings were brisk and the general tendency of prices was upward—good medium to fine Pekoes were decidedly dearer. Messrs. Gow, Wilson & Stanton's telegraphic

report of 8th instant to Colombo states that the quality of offering generally is improving and the market steady. Fair liquoring Ceylon Pekoe Souchong is quoted 6½*d.*, average of Ceylon tea sold on Garden account during the week 7¾*d.* Reuter reports 27,000 packages, Ceylon tea offered, 26,000 sold, Fair Pekoe Souchong 5½*d.*, average of the week 7⅞*d.*; 39,000 packages Indian Tea offered, 36,000 sold; average for the week 9½*d.*; (which shows an advance of ¾*d.*)

Indian & Ceylon Teas. Writing to the *Times*, Mr. J. Ferguson, of Colombo, remarks that it may now be stated that there are, in round figures, 470,000 acres planted with tea in India, and 370,000 in Ceylon. The time has come, however, for "suspending further planting operations until it is seen what is to become of the additional crop (say, 50,000,000 lb. at least) which the young tea is capable of producing." This is a very pertinent remark for, no matter what happens to Exchange. Tea planters cannot hope to see prices rise if they continue to grow more than the world consumer year by year. The opening up of new markets does not receive in Southern India the attention that it deserves. The cultivation of *Indian* demand in particular is neglected in a most incomprehensible manner.

Becoming Careful. After recent experiences with special regard to coffee and chicory, London Magistrates are dubious as to granting summonses under the Adulteration Act. At a metropolitan police-court recently, a Sanitary Inspector asked for a summons against a local grocer for selling as coffee an article to which there was a large admixture of chicory. "Have you well considered this matter?" asked the Magistrate. "Because you know after what we have heard of the difficulties of mixing and the remarkable results of the different analyses, you would need to be pretty sure before taking the risk." The Inspector replied that these matters has been considered. There was 45 per cent. of chicory in the sample in question. "Very well," said the Magistrate, "take the summons and the risk."

The Ceylon Tea Crop for 1898. At a meeting held at Kandy on 9th instant the Planters' Association Committee decided to reduce their estimate of the Ceylon Tea Crop for 1898 by 7,000,000 lb. It now stands at 118,921,400 lb., as against actual exports last year of 116,054,567 lb. One of our contemporaries in Colombo appears to think that 1898 shipments will fall short of those of 1897. It is noticeable that the report of the St. Helier's Tea Company, Limited, states that the yield of the estate for the Season just ended is *the shortest for many years back*, the yield being just under 390 lb. per acre off the 226 acres in bearing. This is attributed solely to "the abnormal season." As a rule, says the report, more than one-third of the year's crop is secured in March, April and May, but this year owing to an absence of the usual showers or owing to some climatic influence the rush of leaf during those months was wanting.

The Currency Question. Alluding to the fact that in order to bolster up exchange the sale of Council Bills is being fixed at about 30 lakhs per week, while demand runs to considerably larger figures, Mr. Moreton Frewen writes to the *Times*;—"We were assured when Parliament sanctioned the recent loan of six millions that this money not asked for, and would not be employed, to bolste the currency proposals of the Government of India. yet only for that large credit there is no doubt but that Secretary of State would be now selling his normal am of bills—say, 65 lakhs per week—in order to pay his It may be supposed that the Treasury balances are low was the case a year since, because of the famine, and for this reason the rupees are not in the Treasury to But this is not the case; the Treasury balances are 1,500 lakhs—quite 60 lakhs in excess of the balances i Treasury in June and July, 1896. In July, 1896, the we sales were 50 lakhs; in July, 1895, 60 lakhs. It is prepo ous to declare that exchange is steady around 16*d.* w the Government of India—the greatest silver seller earth—is living by borrowing gold. If no bills at all sold and continuous gold loans made, to put off the day, the exchange could be forced up for a year or even to 2*s.*"

What happens when Coffee is roasted. Messrs. A. Juckenack and Hikger have recently studied alterations which take place w coffee is roasted with the addition of 3 or 9 per cen sugar as practised in Germany. The chief results of t experiments are as follows:—(1) Caffeine: in the ordi process of roasting coffee loses about 21 per cent. o caffeine, and about twice that quantity when roasted sugar, owing to the higher temperature which is requ to caramelise the sugar so as to glaze the coffee. (2) From 9 to 10 per cent. is lost during the ordinary pro of roasting, and about 20 per cent. in the glazing proc As a rule the different constants of the fat show an incr on roasting by either method. (3) Organic matter: In author's experiments the loss on the average amounte 11,375 per cent. in the ordinary roasting, whilst in glazing process it was about 10 per cent., allowance b made for the amount of caramel. This was determine Stutzers' method. Twenty grms. of the glazed beans shaken in a machine for five minutes with 500 grms water at 20 deg. C. The liquid was filtered, and residue in 250 c.c. of the filtrate, after deducting the was taken as caramel. In this way, on coffee glazed 9 per cent. of sugar, as against 1·25 per cent. of su there was found 1·40 per cent. of caramel, as against per cent. on a sample of Java coffee glazed with 8 per of sugar.

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain ton:—

61·50	lbs.	Nitrogen.
57·38	„	Potash.
14·92	„	Lime.
13·68	„	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed the parent trees of above analysis at Rs.6 per pound contai about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere from the

MANAGER, ARIENKOW ESTATE,

Shencotta

Planting *v.* Farming. A "contributed" paper in the *Planter* sets out that in the near future, planters engaged in raising indigo, tea or coffee, will find it incumbent on them to adopt a system of utilising land which is more rational and scientific than the existing system. "Planters choose some one individual product which they imagine they can grow successfully and profitably at all times. But the conditions under which they set to work soon give place to others which are less favourable. Rival planters set up plantations on improved principles, which goes to reduce the price of the product, heighten the price of labour, and upset all previous calculations regarding profits. The land also, perforce, gets year after year less suited for growing the individual crop that is chosen." In all this the writer's remarks tally with those of Mr. Cameron, reported in our account of U.P.A.S.I. Committee proceedings, given on another page. And the following remarks are also worth attention :—"Even when manuring is resorted to, blights and insect-pests, which always find their proper host-plant ready at hand for them to grow and multiply, sooner or later involve the question of growing the crop successfully with insurmountable difficulties. The balance of nature is bound to be disturbed, giving rise to epidemics, when a particular plant is grown, or a particular animal reared exclusively in any locality on an extensive scale. Tea-blights and coffee-blights, potato diseases and betel-nut plague, pleuro-pneumonia and pebrine and sugar-cane borers are not mere accidental growths. They follow the ordinary course of nature in their gradual and rapid development under suitable surroundings. When a crop is overdone, blights cannot be avoided." The above points to a suggestion of rotation of crops, whereas Mr. Cameron recommends careful selection of seeds and the introduction of new varieties for hybridisation purposes. There is a good deal to be said in favour of both systems, but which would best stand the test of practical trial cannot yet be determined. The one thing that is clear is, what Mr. Cameron, the above writer and many others are now agreed upon, *viz.*, that agricultural training, scientific and practical, is becoming more and more a necessity to the planter—whether it be supplied in his own person, or that of his assistant, or that of a scientific expert whose advice is at his disposal.

Market Reports. The *Produce Market Review* of 20th August makes the following remarks on the position :—*Tea—Indian.*—The market has been amply provided with a good selection, and of the 35,000 packages brought forward a very fair proportion consisted of desirable sorts. The few fine Darjeelings, although realising good prices, did not meet with such brisk competition as last week, and buyers were able to secure them on more favourable terms. The lower grades of this growth are in somewhat large supply, but the demand is slow at the comparatively easy prices ruling, due to the fact that most of the teas were deficient in flavour. For the Assam Teas, most of which continue quite up to the average, there has been a good inquiry, with a fairly large business doing at irregular and, in some cases, at slightly lower prices. This ease in the market applies to the medium sorts, while the finest descriptions are keenly competed for at quite last week's rates. In most cases other growths still remain about on a par with the earlier shipments, being very poor in cup and, jugdging from the Calcutta reports, it will be some little time before there is much improvement in either the Sylhets or Dooars Teas. At the public sales 35,253 packages were catalogued and 31,303 disposed of.

Ceylon.—At the public auctions held on Tuesday last the quantity of this description brought forward was again exceptionally heavy, totalling some 29,702 packages. Notwithstanding this large supply immediately following the record sale of last week, competition was keener than before, nearly all grades being distinctly firmer, and teas for price especially were more difficult to obtain, except at advanced rates. In point of quality a slight improvement was noticeable in several instances, which will in some measure account for the higher prices obtained for several well-known marks. Of the 29,702 packages brought forward, only 1,220 failed to find buyers.

Coffee.—The auctions have again been much below the average at this time of year, and have contained little beyond Central American descriptions. These have mostly all sold freely at prices which in nearly every instance were against buyers. The few lots of fine Costa Rica were bought in for higher rates, although full prices were offered. The commoner grades sold at an advance of from 1*s.* to 2*s.* per cwt. Colombian and New Granada met with good competition at firm prices, particularly the bold coloury parcels, which fetched rates quite equal to those ruling last year. No business is reported in East India, but Plantation Ceylon, of which there has been rather more offered, has sold at a slight advance. In the terminal market the heavy daily receipts have checked speculation, but quotations have been well maintained, and some growths are slightly dearer.

LETTERS TO THE EDITOR.

A CO-OPERATIVE SALTPETRE REFINERY.

Sir,—In an editorial note in your issue of August 27th, you say "* * * * * the opinion we hold, that to make a venture which has great possibilities for planters a thorough success, the identity of the promoter should be revealed, and the scheme started with a pucca debenture subscription." Again, in another note in the same issue, "We think that the whole scheme must be put on a thorough business basis before it will take a practical shape." I am sorry you should have so completely misunderstood my motive in suggesting the establishment of a Co-operative Saltpetre Refinery under a *nom-de-plume*, instead of under my patronymic. In taking that course my reflection was, "If 24 men are not willing to support me in starting a refinery, after I have sketched the scheme, let it die a natural death, and there will be no occasion for me to push myself before the public; but if I find 24 men are willing to support me, I will take it up in earnest, and put it into proper business shape." *Of course* I meant to "reveal my identity," and "place the scheme on a business basis," directly I found it would "fizz." All this I thought would have been clear from the concluding para. of my first letter on the subject (see *P. O.* of July 16th). I have now received letters from eleven planters, signifying their willingness to join, and five more have promised to join shortly. There is, therefore, every prospect of the scheme coming to a head; and I think the time has come to "elaborate" it, as I promised to do in my original letter.

Constitution of General and Executive Committees.—I have estimated the amount required at 25 estates at Rs.50 each, but 20 subscriptions will yield enough to enable a start to be

made. When the number of applications reaches twenty, I will ask one subscriber from each district to serve on a General Committee, which will have entire control of the whole scheme. But as subscriptions come from several planting districts, this General Committee will be scattered over a wide area; and it will therefore be necessary to appoint a small executive or working Committee, resident within a reasonable distance of myself, to whom questions of working, &c., can be easily and quickly referred. The following planters, I suggest, should form this Committee:—Mr. A. G. Nicholson, Mr. Rhodes James, Mr. L. C. Liebenrood, and myself, *ex-officio*, as Honorary Secretary.

Payment of Subscriptions.—The Committees having been formed, I will ask all planters who have joined to pay their subscriptions. Messrs. Arbuthnot and Co. have kindly consented to act as Treasurers of the scheme, and all subscriptions must be sent to them.

Expenditure and Accounts.—When the subscriptions have been paid, I will go down and start work. I estimate that for buildings, plant, &c., Rs.250 will be required. The rest of the fund will be laid out in advances to Upiliyas or A. Licensees (who collect the nitrous earth, and carry out the first process—the manufacture of crude saltpetre) as may be necessary. I will draw against the refinery fund for such sums as I may require, by cheque; and will render a monthly account of expenditure to the Executive Committee. Annually the accounts will of course be laid before all subscribers. I shall expect to be recouped my actual expenses in travelling and living while I am starting the refinery. Further than this I ask nothing for my services, and will carry on the duties of Secretary without charge.

The forms of account to be maintained at the Refinery, and by myself as Honorary Secretary I will settle in consultation with the Executive Committee. I have drawn them out already. I may say here that as it will not be possible to maintain a staff for the preparation of bills, all saltpetre will have to be paid for in advance, the money being sent to the Treasurers and the order to me

Object of Refinery.—I propose, at least for the present, to limit the subscription list to 25 members. These subscribers will have the privilege of obtaining all the saltpetre they require, at actual cost price. If there are any surplus stocks, they can be disposed of in the open market, but of course non-subscribers will have to pay something over and above cost price. The issue price to non-subscribers will have to be determined by the Committee. The co-operative refinery will, to begin with, be a small concern; but I shall not be surprised if its development is rapid. When non-subscribers find that they can get saltpetre at, say, Rs.100 per ton equal to, if not superior to, the saltpetre now imported from Calcutta and sold at Rs.200 per ton, sales are bound to rise rapidly. My own opinion is that in a short time the profits accruing from the sale of saltpetre to non-subscribers will not only cover all expenses connected with the refinery, but will leave a substantial sum for division amongst subscribers. But I wish it to be clearly understood that that is entirely a side issue. My present purpose and the object I have steadily in view is to provide really good saltpetre at a low figure to myself and 24 other planters who are willing to provide the funds necessary to achieve this object.

Subscribers will have to give previous notice of their requirements, so that arrangements can be made to meet these before disposing of any saltpetre to non-subscribers.

Site of Refinery.—The first refinery will be either in Trichinopoly or Coimbatore. In both these districts there are excellent nitrous earth deposits. The latter would be nearer and more central to the majority of estates, and I should say Coimbatore definitely, but for the fact that I know of a very large pucca building in the village of Moganur on the Kâveri, in Tric District, erected expressly as a Saltpetre refinery many ye ago; and it might perhaps be an advantage if this could secured. Before finally deciding I should like to see it aga If the choice falls on Coimbatore, I hope to be able to put up refinery in or near the town.

This will have two great advantages:—The Railway will close, and the refinery can be easily inspected by any subscri passing through. As many of the subscribers are resident the Nilgiris, I hope such visits will be frequent. They will a long way towards keeping the Overseer in charge up to collar. Eventually I hope it may be possible to start a separ refinery for each planting district. At Coimbatore for Nilgiris and Wynaad; at Salem for the Shevaroys; at Dindig for the Pulneys, and so on; but it will be necessary to ma a start in a small way, with one refinery, and the most cent site for that will be, I think, Coimbatore.

Management of Refinery.—I will, as promised, persona supervise all preliminary arrangements and the actual mar facture until the Overseer is competent to take charge operations. The refining process is neither complicated difficult; and it will not take an intelligent native Overs long to grasp it. For the present an Overseer on, say, Rs.25 30 per month will be sufficient. If the refinery proves succe ful, and branch refineries can be located in all planting centr it will probably be necessary to have an Inspector on a high salary. But that can be left over for the present.

Quality of Saltpetre.—I now come to the most importa question of all. What quality of saltpetre will the refinery tu out? Through the kindness of Mr. A. G. Nicholson, of Coono I am able to give details on this head. Some time ago t gentleman started a refinery in Dindigul to supply his own nee An Overseer was placed in charge, and he received Rs.50 every ton of saltpetre. Mr. Nicholson considers that the actu cost was considerably less, as the Overseer admittedly mad large profit under this arrangement. The saltpetre made this private refinery gave this analysis:—

Nitrogen	7·715 ...	per cent.
Potash	26·537 ...	

Mr. Nicholson also had an analysis made of the saltpet imported from Calcutta and now sold at Rs.200 per ton, four times the price of the saltpetre he made himself. This C cutta sample yielded:—

Nitrogen	... 8·13	per cent.
Potash	...31·42	

Planters can now judge for themselves whether it is wor their while to go on paying the present exorbitant price f imported saltpetre when they can make practically the sa article for a quarter of the price. Our saltpetre would certain be up to this standard, but I think I can safely promise that a similar price it will be much better. I gather from Mr. Nich son's letter that ordinary native methods of manufacture we followed at his Dindigul refinery, whereas it is my intention introduce, as far as possible, the English system. I do n think it is necessary to enter here into a disquisition on t difference between the two methods. Briefly, all organ impurities can be easily eliminated by the use of common gl (no native refiner ever thinks of clarifying his nitrous solution while the inorganic impurities can also be got rid of in a larg degree by the substitution of shallow crystallizing pans peculiar shape for the earthen vessels buried flush with t ground now in universal use. I believe that with greater ca exercised over the refining process and with the adoption improved methods, it will be quite possible to turn out a samp giving 9 per cent. nitrogen and 35 per cent. potash at Rs. per ton. The refinery could of course make absolutely pu nitrate of potash, but that would mean further refining a consequently greater expense. I am at present merely concern

with what can be done for Rs.50 per ton. The Calcutta sample gave 25·87 per cent. of sodium chloride and 5·08 per cent. of moisture. The former is evidence of carelessness in the refining process; and from the latter I judge the saltpetre was in large crystals. These always retain some of the mother-liquor in their interstices with a proportionate amount of impurities. By keeping the nitrous solution in a state of agitation while it is cooling, smaller and purer crystals can be obtained. In England the fine crystalline needles called "saltpetre flour" are considered the most valuable.

I do not know that anything further remains to be said regarding the preliminary arrangements for the proposed refinery, but if you, Mr. Editor (or any planter interested in the scheme), will suggest any additions or improvements that may occur to you, I shall be most happy to consider them. And I trust the "business basis" on which I have now placed the refinery will be regarded as satisfactory. If it has faults, they are faults of omission, not commission, which I shall be very glad to have rectified.

F. W. F. FLETCHER.

ROCKWOOD, NELLAKOTTA, NILGIRIS,
10*th September*, 1898.

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U.P.A.S.I.]

The representations made to the Mysore Government with regard to the desirability of employing an Agricultural Chemist have borne good fruit. The Durbar have on further consideration decided that there is employment for a full time man for several years to come, and have therefore applied to the Government of India for the employment of Dr. Adolph Lehmann for a period of five years. They are willing to lend the expert's services upon occasions to planters and other landholders upon payment of a moderate fee.

The above probably destroys Coorg's chance of co-operation with Mysore in this matter, but, on the other hand, the Durbar have not stipulated that their expert's services are to be at the disposal of planters and landholders in Mysore alone. So, no doubt, Coorg and other districts will be able to arrange so as to derive some benefit from Mysore's action. The pity is that the Madras Government does not also realise how much scope there is within the Presidency for the investigations of a highly trained agricultural scientist.

The Ceylon Planters' Association has had under consideration the resolution of the U.P.A.S.I. regarding Reduction of the British Tea Duty, but the minutes of proceedings of the meeting held on 9th instant give no clue to the opinions of Ceylon planters. No doubt, something more definite will be made known in a short time.

Our Ceylon friends are going in "bald-headed" for a Labour Federation. They have adopted the following report of a Sub-Committee appointed to consider the matter :—

The Sub-Committee begs to report that whereas lists have been received showing that the Representatives of Estates exceeding 195,000 cultivated acres have consented to join a Labour Federation, after consideration of the Provisional Rules adopted by the Planters' Association, and whereas a considerable number of districts and estates are as yet not canvassed, not being connected with a District Association, the Committee of the Planters' Association be, and they hereby are, advised to call a general meeting of all who have agreed to join the Federation and of all others who are interested in the question (II) that the lists as submitted be printed and circulated to each District Association to members of the Planting Community not on the Register of the Planters' Association, and to all others interested.

The appointment of Mr. Kelway Bamber as tea expert has been formally confirmed by the Planters' Association of Ceylon, and the following resolutions passed in connection with the matter :—"That the following list be accepted as the list of districts giving a complete representation of Ceylon tea, and in addition that it be recommended that in each of the three large districts of Dimbula, Kelani Valley, and Dikoya, representing over 30,000 acres each, two estates be selected. Districts (1) Ambagamuwa, (2) Badulla and Namunukula, (3) Dikoya, (4) Dimbula, (5) Dolosbage and Yakdessa, (6) Haputale, (7) Hewaheta and Old Maturata, (8) Kalutara, (9) Kelani Valley, (10) Knuckles, Kalabokka, Hunasgiriya, Rangala, Hewa Eliya and Lunugala, (11) Kotmale, (12) Madulsima, (13) Maskeliya, (14) Matale, (15) Nilambe and Hantane, (16) Nuwara Eliya District, (17) Punduloya, (18) Pussellawa, (19) Rakwana or Morawa-korle, (20) Udapussellawa and New Maturata."

"That the Secretary do forward the list of districts above mentioned to all District Associations intimating that one estate in each of such districts will be visited by Mr. Kelway Bamber, and inviting the District Associations to appoint a Sub-Committee to select the estate in the district to be so visited threafter transmitting the name of the estate so chosen to the Secretary, 'Thirty Committee,' before the 1st October, 1898, from which date Mr. Bamber's engagement begins. If the name of an estate is not sent in to the Secretary by the 1st October, it will be deemed that the selection of an estate is left to the decision of the 'Thirty Committee.'"

PREPARING BONE MANURE.

A GOOD method of utilising bones as manure is described in the practice of Mr. Walter Thomson, of O'Halloran Hill, Australia. He first made a layer of farmyard manure in a suitable spot, then a layer of crushed bones, followed by another layer of manure, then bones again, and so on, till the heap was of a suitable height. A small gutter or drain was made around the heap leading to a pit, where the drainings were collected and poured back again over the heap. This was in the winter season. In the summer a little water would require to be added. He suggested that a little weak sulphuric acid, 1 part of acid to 400 of water or drainings, would fix the ammonia and prevent its loss by evaporation. He favoured acid instead of gypsum, which is usually employed to fix ammonia, as the organic

matter of the manure would decompose the gypsum and form sulphate of calcium—a noxious ingredient, which prevents the use of gas lime as a manure. Of course the smaller the bones the quicker will be the fermentation. Mr. Thomson said the work of fermentation was so well done that he could not find a piece of bone in the heap, and he estimated his crop at 32 bushels per acre in a dry season which was dressed with this manure.

CEYLON PLANTERS IN NATAL.

MR. JOHN FRASER SECURES A GOLD MEDAL FOR HIS TEAS.

MR. JOHN FRASER has secured a gold medal for the tea he exhibited from the Barrow Green estate in Natal, at the Durban Exhibition, reports of which have just reached us from Natal. In fact, one of his fancy samples was valued at £5 a lb., and the judges at the Show, as well as the Press, are full of praise for the skill of the old Ceylon planter. *The Natal Advertiser* of the 14th July writes as follows :—

"The Barrow Green estate's display was beyond comparison for Colonial tea, and inspired judges of good tea with ecstatic eulogistic comments. In the higher grades, a wonderful improvement over last year's exhibits was noticeable, and the fancy teas were the finest ever shown in Durban."

Another Natal paper says:—

Show Tea.—The Barrow Green Estates, Limited, received gold medal for best teas in the ordinary grades—three firsts, and first prize for naval oranges, as well as highly commended for 50 small Spanish lemons in the fruit section. "I think (writes Mr. John Fraser) the judge of the teas will bear me out when I say the whole of the teas on show this year (first and second, as well as special prize teas) have never been equalled before in any Show in South Africa, in either appearance or quality."

RUBBING IN FACTS.

IN various quarters the U.P.A.S.I. has been reproached with travelling repeatedly over the same ground, and reiterating the old instead of telling something new. The following from the *Home and Colonial Mail* shows that the Association is not alone in favouring a policy of "hammering the nail home":—

The British-grown tea industry has arrived at a critical stage in its history. Every opportunity should be used for impressing the truth on the public mind that a progressive and flourishing industry is suddenly restricted owing to the measures taken by the Indian Government to inflate the value of the rupee. Before it is too late the facts should be known far and wide. Twenty years ago sugar planters were calling attention to their grievances and pointing out the inevitable collapse of the sugar industry under the burden of bounty fed beet, but no practical steps were taken to investigate the position until the eleventh hour, and now, we fear, aid has come too late. The tea enterprise of India and Ceylon is threatened with disaster unless something can be done to dispel the currency cloud which hangs over it. There is no secret about the impending trouble. Already its effect is seen in declining prices of shares, and in the withholding of further capital from this field of investment. Planters have had to admit facts which stare them in the face, and although it is an unpleasant enough business, this admission that their pursuit is likely to become unremunerative, the statement has to be made in plain English. No help is to be expected from the economists. Under these circumstances it behoves every friend of tea, and not only of that industry, but of each and every productive industry of India and Ceylon, to move every force and use all the influence possible to bring the facts before the public notice.

THE INDIAN CURRENCY COMMITTEE.

MR. ACWORTH BEFORE THE CURRENCY COMMISSION.

TEXT OF HIS EVIDENCE.

THE following is, says the *Madras Mail*, the evidence given by Mr. G. L. Acworth, representing the South Indian Planters, before the Indian Currency Commission :—

What in your opinion was the effect of the closure of the Mints in 1893 upon the trades that you are specially representing?—W stopped extension.

It arrested progress?—Certainly it arrested progress. I that from my own estates. I am one of the largest raisers c seed in South India. I used to be able to fill my order book in advance. At this time last year my order book was comp for 1898. This year I have been trying ever since the beginni the year to get orders for 1899, and I have not been able to b single order, not one.

Do you think that that at all arises from any excess of productio No, I do not.

Then the production of 1897 would be about the same as 189 1859?—No, I am sure it was not.

You mean there has been no extraordinary increase of pr tion?—No, the increase in the production of tea of late year been gradual, but steady.

Does that apply also to coffee and cinchona?—Coffee and cinc are on rather a different footing to tea in South India. Cinc was so largely produced some years ago that it hardly pays now long before the closing of the mints there was a great decrea the exportation of cinchona. Coffee, on the other hand, will grow in very favourable situations, and I do not suppose th Southern India you could find a further 2,000 acres suitabl coffee.

That has been a state of things that has existed for some year Many years.

You would not connect that with the closing of the mints?- though I consider that the coffee planter is not hurt as much as tea planter.

We have heard it stated for many years past that the consum of coffee in this country is decreasing?—I believe that is so.

That will also have an effect in arresting the progress of the c trade?—Hardly, because it increases in other countries.

Have you any other injurious effect excepting the arrest of gress that you can point to?—Yes, your income is conside curtailed.

But arresting progress is one thing, retrogression is another. it diminished production?—When you have a large capital inv in a thing like an estate in India you cannot shift your capital a It takes you many years to bring an estate into bearing. You to build large buildings and fill them with expensive machinery. are compelled to go on. So that for the present there would tainly not be a diminution in production, but I know that exp are being cut down, and only two mails ago I heard from my a in Ceylon that in May 150 superintendents were dismissed owi lack of means to pay their salaries. I will read you the letter i wish it. It is dated 4th June, 1898. Mr. R. W. Cole, my agent, s "You know, no doubt, what a terrible panic exists in Ceylon a present time owing to bad prices and that cruel exchange. The c smash was nothing to what the smash impending in the tea tra now. The owners of tea properties are panic-sticken, nearly e place being worked at a loss, or only just paying its way without profit. To men whose capital is locked up in tea, and who are dep ent on their profits therefrom, it means absolute ruin, as it does to superintendents and assistants whom proprietors cannot affo keep on. One hundred and fifty were dismissed from estat Ceylon in April for no other reason than that the Companies coul afford to retain their services, and I know of a case of a visiting a who, after a fortnight's visit to up-country properties he represe returned to Colombo at the expiry of that time after having giv month's notice to 27 superintendents for the same cause."

Do you think that is attributable in the main to the rise i change?—I think, entirely.

Now, first of all, have the prices of tea fallen?—Do you m momentarily?

I mean gold prices in London?—Do you mean momentaril for a series of years?

I mean since the mints were closed?—Yes, I think they have.

I want to know whether prices have been falling or rising?— mints were closed in 1892-93. The market has fallen about 2¼*d* pound since then.

That is the gold price in London?—The gold price in London

What was your price in London in 1891?—10*d*.

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

And now what is it?—7*d*.
How would the gold price in London be affected by the closing of e Mints?—We have to accept a cheaper price on account of our mpetition with China.
It is a question of competition?—A question of competition.
If there was no competition it would have no effect whatever?—es, it would.
What?—It would have an effect on our purchases of silver. We rk on a silver basis in India. We receive gold for our prices, and have to buy silver, and send it out to India.
I will come to that presently, but I want to proceed step by step. far as the price of tea in the market in London is concerned, it of course, totally irrespective of whether the article comes from dia, or from China, or elsewhere. The gold price of tea in London uld not be affected by the closing of the mints in India?—No, it uld not.
I am not saying that your profits or losses would not be affected, r am I intending for a moment to imply that your expenses might t increase or decrease, but so far as regards the gold price in ndon, it is not affected by the closing of the Mints?—It is tirely, I should say, a question of supply and demand.
I suppose the price in London represents practically the price in e world generally?—Yes, I should imagine so.
I was going to ask you whether there is any difference in merica?—That I could not tell you. If you are going to allow us bring in the argument of competition with China, then that es come in.
Yes?—There is a difference, because we have to compete with ina in America, and we have to accept much lower prices.
You did have to compete with China in England?—We did.
And as tea could be produced more cheaply in India than in China u have beaten them?—We have beaten them. We have produced better article, and it has met the taste of the public. The reason is at, in spite of the price, Indian tea is a cheaper article per pound an China tea. You get very nearly double out of a pound of Indian a, so that it is cheaper to pay 7*d*. for Indian tea than 5*d*. for hina tea.
Then the gold price being outside the question altogether, is it to ur advantage or disadvantage that the current price which you ceive in London should produce more or less rupees in India?—hat it should produce more.
Why?—Because we pay our labour in silver.
Do you pay anything else but labour in silver; I suppose what-er machinery you use is exported from England?—Yes. There is thing more but labour, but that is, I suppose, 90 per cent. of our hole expenditure.
Of your expenditure on production, nine-tenths of it would be bour?—Yes.
And, therefore, while you might gain on one-tenth by a fall in xchange you lose on nine-tenths by a rise in exchange?—Yes.
Have your wages been stationary, or have they increased or ecreased?—You might almost say that they have been stationary. hey have increased very slightly.
Now will you explain to the Committee what you alluded to just ow as the bullion competition with China, and the effect upon the a trade of that—first in our market, and then in the American arket?—I can put it to you here in figures. We will say that "A" ips from India 100,000lb. of tea, and receives in London 7*d*. per .; he remits the proceeds to India at 1*s*. 4*d*. the rupee. He ceives for that Rs.43,750.
In India at 1*s*. 4*d*.?—In India at 1*s*. 4*d*. "B" ships from China 00,000lb. of tea at 7*d*. per lb. He remits the proceeds to China at . 11⅛*d*. per dollar, which is the present price of exchange on China, r which he receives 30,270 dollars; 30,270 dollars are equivalent to s.60,540. Therefore China has the advantage over India in every 0,000lb. of tea of Rs.16,790; or, to put it in other words, in every ound of tea she receives a bonuds of one anna eight pies per lb.
Now, are wages the same in China as they are in India?—That I nnot tell you.
Do you think the cost of production is more or less in China than India?—I should imagine much less in China; of course, I have no al knowledge.
But your opinion would be that it would be less, and I suppose at would be the opinion of most people?—Yes, but I would draw our attention to this. China has an advantage of one anna eight es per lb. He is a very very fortunate planter in India who makes profit of 1 anna 8 pies per lb. on his tea.

That being the effect of what we call the bullion competition, will you tell us how it has affected the imports from China and India into America?—I have not the figures for that, but I can get them.
Then will you put them into your evidence when you correct your proof?—If they are to be had in the City I will get them. I may say that, if our exports to America are increasing, they are probably increasing through our own action there. I mean to say we tea planters have for many years past taxed ourselves voluntarily, and kept a representative in America to push our produce. We had no field in America before we took that action. I do not suppose there was 100,000 lb. of Indian tea drunk throughout America, and last year we had increased our exports to 10 million lbs. But it was entirely by our own exertions, because at the first many of the large dealers in America absolutely refused to store our tea in their warehouses.
I suppose your increased sales in America sprang from the same causes as did your successes in competition with China in this country—that you gave a better article?—But we had to give it away at first. When you take our increased exports into America it must be remembered that that is done by our own efforts, and that it is not likely that we shall be able to go on doing it.
Why no?—You have an enormous market there in America?—Yes, but we shall soon be making no profit, and cannot afford to tax ourselves.
(Sir F. Mowatt): That does not mean that you are making no profit now?—We are making a bare profit.
You are not continuing to give it away?—No.
(Chairman): Do you pay your wages in money or in kind?—In money.
Altogether?—Altogether.
The mints now being closed, what do you think is the best course to take? Are you in favour of re-opening the mints?—Of course I am not a currency expert, and I do not pretend to know what the effect of re-opening the mints would be, but I certainly think it would be for the benefit of the Empire to re-open the mints. It should never be forgotten that the Indian Empire is a producing Empire, and that it is not merely the Government remittances that have to be considered, but the 250,000,000 labourers behind them.
You do not think that the actual amount of wages has varied much?—No, they have a little, but not much.
Has the purchasing power of the rupee varied?—No; not for such goods as our coolies use. It depends entirely on seasons. If there has been a good season, such articles as they consume are cheap. If it is a bad season they are dear.
Assuming there has been no rise in wages, which represent $\frac{9}{10}$ths of the cost of your production, the larger number of rupees that you receive in exchange for your gold price is so much additional profit?—So much additional profit, or perhaps, to put it in another way, it saves us from any loss.
Have you at all considered what would be the effect on the finances of India of open mints and a fall in exchange?—I have considered it of course from the point of view of what I may call an outsider. As I say, I do not profess to be an expert in the currency question.
This is not a currency question: it is an administrative question?—I suppose the rupee would fall, and that perhaps, temporarily, it might create a certain amount of difficulty, but it would only be temporary, and I believe the Government of India is very well able to meet its obligations. It always has done so, and the other day Lord George Hamilton stated in the House that no country except the United Kingdom could show such a record in its finances for the past twenty years.
That is not with the rupee at 10*d*.?—But it had gone to 1*s*. 1*d*. in that time.
May I take it that in your judgment the tea producers in South India, where you have personal knowledge, and certainly in Ceylon, where you say the considerations are the same, would be handicapped in competing with silver countries by keeping the exchange at 1*s*. 4*d*.?—Undoubtedly.
And the other effect also upon your trade would be that it would practically amount to such an additional burden in the cost of your production that it would deprive you of any gain?—I think so certainly.
Is there anything else that you wish to say in addition to that?—I do not think I have anything more to say on that subject, but I should like, if I may, as I have been asked to represent that industry, to turn to the subject of the gold production in Mysore.

That is increasing rapidly, is it not?—It is rapidly increasing, but it is also very heavily taxed.

The gold is?—Yes, by the artificial rate of the rupee. Gold is almost as good an instance as one can take. The price of gold may be reckoned as £3-17*s.* 6*d.* the ounce, and that price is steady: it has not varied, I think, ever since England introduced gold standard.

In Mysore?—Mysore has followed the price all over the world. Sir John Taylor and Sons, who are the head practically of the gold mine industry in Mysore, write to Mr. Hodgson, who passed the letter on to me, "The expenditure at the Kolar Mines affected by exchange amounts to about Rs.6,33,000 per month or Rs.75,96,000 per annum, therefore, every penny that is added to the price of the rupee increases the expenditure by £2,637-10*s.* per month, or £31,650 per annum."

During the greater portion of the period that the Mysore mines have been open has not the exchange been much higher than 1*s.* 4*d.*?—Before the closing of the mints it did not affect them, because they were working on an equal level with other countries. They were all on a par.

Are they not paying higher dividends this year?—That may be due to more production.

But that tempers the East wind to the shorn lamb?—It may temper the East wind to the shorn lamb, but still they have this loss of £250,000. If they had their mines anywhere else they would be £250,000 a year richer than they are now.

(Mr. Campbell): You think the rupee was fixed too high at 1*s.* 4*d.*?—I think it was a mistake to fix it at all.

You think it is too high at 1*s.* 4*d.*, would you think it too high at 1*s.* 3*d.* or 1*s.* 2*d.*?—I think it a mistake to fix it in any way.

That is to say, you would not have a gold standard at all?—I would not have a gold standard. I think it is unsuitable for India.

If you have a gold standard you must fix it?—Yes.

The tea industry was very prosperous some years ago when exchange was in the neighbourhood of 1*s.* 2*d.*?—Yes, before the closing of the mints.

Before the closing of the mints exchange never fell to 1*s.* 2*d.* I am speaking of 1894-95?—Yes, that is so.

The tea industry was a very prosperous one then, was it not?—Yes, it was.

And if exchange instead of being fixed at 1*s.* 4*d.* had kept at about that neighbourhood, is there reason to suppose that it would not have been as prosperous now?—I think it would not be prosperous.

For what reason?—I think if you are going to fix it at 1*s.* 2*d.* when its true value is 10*d.*, you still handicap the Indian producer in his competition with other countries. Of course it takes time to feel the effects of a measure like the closing of the mints. In 1894-95 we had not begun to feel it, it is only recently that we have done so.

You would object to anything but the silver value of the rupee?—I should object to anything but that.

The production of tea has been increasing a good deal during late years, has it not?—It depends on what you call during late years. If you take the last three years, the output has not been increasing much.

And consumption, I think, has increased?—No, consumption, I think, is pretty nearly steady now; there is not much more room in the United Kingdom.

So that you do not hope for any increase in prices owing to the increased consumption?—I do not think there is any chance of that. Of course in a bad season there may be a temporary falling off in crops which may conduce to a slightly higher rate, but I do not think there is any chance of a permanent rise.

Not even if the curtailed production which you spoke of is continued?—I do not think so.

You say you have driven Chinese tea partly out of the English market?—Yes.

But you have not done that in America?—We have hardly displaced it at all.

And in Australia?—In Australia we have practically driven China out of the market, but we did that long ago.

Do you know if China is making any effort to regain her hold of the English market?—Well, that she is making efforts to regain her hold on the English market I cannot say, but I know that China is making every possible effort to improve her tea, and I presume that that means she will push it into the English market when she has improved it.

You mean by improved cultivation———?—Improved cultivation and improved manufacture.

Have you seen any indication of European enterprise b associated with it?—Only from what I have heard. There is Foochow Tea Improvement Company, whose prospectus you c no doubt get in the City, which has been started for the purpos improving the cultivation and manufacture of China tea, and th a body of British merchants.

If that were introduced on any large scale, and tea productio the lines followed in India and Ceylon were introduced into C China would become a formidable competitor?—Yes, I think could rush us out of our market.

Especially with the handicap of exchange?—I mean with handicap of exchange.

Labour is very cheap in China?—Yes, I said just now to Henry Fowler that I had had no experience, but I do know as a that labour is cheaper in China than in India.

(Chairman): Just to get this figure right, the export of tea from China and Ceylon and from India is rapidly increas it increased last year?—The figures for India last year 148,258,000lb. against 148,217,000lb. That is a difference of 35,0

In the returns that we have it is put at 153,000,000 last year India?—I got this from a large broker in the City. Every cir that is issued by one of the largest firms of tea-brokers in the Messrs. Gow, Wilson and Stanton, points to the fact that the not room for more tea in England. I got that from Messrs. Wilson and Stanton.

The better test after all is the revenue, there is no doubt a that. Now in 1895 the revenue from tea was £3,587,000. In it was £6,746,000, in 1897 £3,799,372. Last year there wa increase again?—Yes.

You say there is no room for expansion of the trade?—I d think there is any room for the expansion of the trade compar the expansion, say, from 1888 to 1892.

I just wanted to call your attention to the fact that there enormously rapid increase of the duty received at the rate of 4*d.* i lb.—No doubt you are right, but this has been done at a great sac to the producer, who cannot afford a further fall.

(Mr. Le Marchant): You were speaking of expansion in the 1888 to 1892. That would have some effect on the market, that say, your supplies have been materially increased?—They have but up to quite recently they were being increased with the obj driving China tea out.

And succeeded?—And succeeded, but at a great sacrifice of That takes place in other industries?—Undoubtedly.

It is a form of competition?—Undoubtedly.

There has been an increase of cultivation in Ceylon?—Yes, a India.

But not to the same extent in India?—Hardly to the same e in India, I imagine, the reason being that Ceylon had to mak her leeway. She was interested in coffee and cinchona, and owi the disease in the coffee they had to get rid of it and to find s thing to take its place. They had their capital in the soil. could not remove it from the Island, and they had to replace c which they did by planting tea.

And with a good deal of profit in some years?—Undoubt nobody works without.

Now, with regard to wages in South India, have they increasing in recent years?—Very, very slightly so. There been a slight increase of wages since I first went to India—a slight increase.

You were alluding to the prices of the articles the ryot h buy. I will exclude the famine year, because that was excepti but taking the period before and after that time, would you say prices have remained the same?—I should say so on the averag

You would not say that there was a general drift upwards?— I think not.

You were speaking just now of the gold mines of Mysore as b placed at a disadvantage by the rise of Exchange. Does that a to anything besides wages? Does that apply to machinery?— it would not apply to machinery.

Merely to wages and cost of labour?—Merely to wages and c labour.

Is mining labour a special class by itself, or does its rate of w vary with that ruling in other employments?—They pay r higher, I think, in the gold mines than elsewhere. The wor underground and is not popular.

So that there is an element either of disagreeable work or gr skill in it which involves an extra price?—Yes, and I think you

nd it is the case with all underground labour all over the world, hat it is rather higher paid than is the labour of the soil.

And that rate of payment may probably have tended to rise more n Mysore than in the tea provinces?— I cannot tell you that, but I hould imagine that they are paying much the same prices now as at irst, perhaps a little less. At first they would have to pay higher rices to get the men to go underground at all, but as the people ot accustomed to going underground they would have been able to ecrease their scale.

Would the wages be higher now than when they were first eveloping that field?—I do not suppose it is higher, but some few ears ago they were working on a level with other silver-using ountries. Since the closing of the mints they have been working t a disadvantage.

Would you say that the majority of the gold mines are in silver-sing countries?—I do not know that there is much in Peru. Mexico s a silver-using country.

But would you not say that the Cape and Australia and America vere three of the chief gold-producing countries?—It may be so, but do not think that will alter the fact that the Indian gold mines are aying more than they ought to pay, using the artificial rupee. Why should they be taxed at that amount? It is a direct tax on heir produce.

But are Indian gold mines at a special disadvantage as compared vith other gold mines?—Competition of course really does not much natter because it is a commodity, the price of which never really aries. You may say that that can always be produced at a profit o far as we have seen at present, but that does not alter the fact hat the Indian gold mines are being fined £250,000 a year.

As compared with what the cost of labour would be if India were n a silver basis?—Yes.

Assuming that nothing else varied?—I am speaking of silver at 26*d.* an ounce.

And that wages did not rise?—Yes, and there is no reason to uppose they would.

(Chairman): Your argument does not apply to countries which are ot silver-using countries?—No. I bring forward gold as a case ecause what happens in gold happens in every other product in India, and when you show that on a small field like the Mysore field here is a tax of £250,000, what must be the tax on the whole productions of India, because the argument as applied to gold applies to very other product in the country, that you are paying a higher value for your labour than you need by paying it in gold?

(Mr. Le Marchant): And that rate of wages, you think, would be he same, whatever the system of currency might be?—I am sure of t. I am quite sure that a low exchange would not alter the rate of abour.

Nor prices?—I imagine not. I have seen the rupee fall from 1*s.* 10*d.* to 1*s.* 1*d.*, and I never found any material alterations in prices.

But they are subject to variations?—They are subject to good or bad seasons.

So that you feel confident that prices would not adjust themselves to a different level of exchange?—I am speaking of the prices that the coolie pays. I do not think that they would alter.

(Chairman): I can just give the exact figures of tea in the United Kingdom retained for Home consumption. In 1891, 202,000,000lb. In 1892, 207,000,000lb. In 1893, 208,000,000lb. In 1894, 214,000,000lb. In 1895, 221,000,000lb. In 1896, 227¾ million lb.

(Mr. Holland): The tea planter and the grower of produce claim to have themselves the advantage of this 10*d.* rupee. Is not that so?—They want to have the advantage of it.

And you have spoken of it several times as being the true value of the rupee?—No, I will not say that, because the value of the rupee varies. I believe silver is 27*d.* an ounce now. I imagine that would make the rupee worth about 10½*d.*

But within those limits, do you not admit that so far from being the true value it is an artificially low value?—No, I do not admit that.

If the mints had not been closed, for instance, do you think the value would have been so low?—You have to take other factors into consideration. For instance, there has been lately a demand by Spain for silver which has sent silver up a penny or three-half pence; but if the mints had not been closed, I do not think we should ever have seen the rupee so low as it did go to.

The ground of your discontent is not so much that you cannot yourselves have the advantage of a low rate, but that your competitors in silver-using countries have that advantage?—Yes.

And therefore your competition with them is unfair?—Exactly.

(Sir A. Dent): Is there much tea grown in South India as compared with North India?—As compared with North India, the tea industry in South India is very small.

Is it 25 per cent. of the tea industry of India?—I should imagine it is not.

Is it 10 per cent.?—I could not tell you without reference to the figures, but I should imagine that of the cultivation of South India, taking tea and coffee together, probably tea is about a quarter of coffee, and, as estimated by the South India Planters' Inquiry Committee, the value of the estates in South India is £13,000,000, that is coffee and tea. So that, probably, the tea might be about a quarter of that. In Travancore, which is a very considerable province in South India, you may say that the whole cultivation is tea, and all through the Nilgiris.

From what port is that shipped?—Cochin, Quilon, and Calicut.

You say there are probably under 2,000 acres left in South India for the cultivation of coffee. That would apply to tea, would it not?—No, there is more available for tea than coffee. Perhaps I am not quite right in saying that there are not more than 2,000 acres available for coffee. I ought to have qualified that by saying that there are other places that are not now available, but could be made available; I mean there are no roads or railways.

As tea in South India is a comparatively small industry, I suppose you are speaking as much for Ceylon as for South India?—I should really speak, too, for North India as regards that, because our interests are identical. I speak for the whole body of tea producers.

But the planters of South India have rather amalgamated with the planters of Ceylon in presenting themselves before this Committee?—Yes.

You told us that 127 Superintendents had been dismissed recently, and that there was practically a panic in Ceylon?—Yes.

Personally, I was rather surprised to hear that, because I hear a good deal about Ceylon. May I ask if that is mere general public opinion, or is it more a private note?—It was a letter to me from my agent. I employ an agent, who is an old Ceylon planter, to get me orders for my tea seed, and it was he who gave me the information. He has been in Ceylon, I suppose, some 15 years, and I have no reason to suppose that his statement is not an accurate one.

When you say 127 Superintendents were dismissed, it might be thought from that that 127 estates had been abandoned?—Not in the least.

Possibly it is only 127 Assistants?—No, I do know that it is even that. I remember in the old coffee days, when coffee was dying out right and left in South India, the first means of reducing the expenditure was to dismiss the Superintendents, and the result was that five or six estates would be put under one management. I myself at one time had seven estates. All seven were under my management, without any other European supervision whatever.

The prospects of Ceylon, of course, have not improved in the last few years, but they have not come to abandoning their estates yet?—Yes, I believe they have.

You do not know that yourself?—No.

I suppose the planters of South India and Ceylon, with reference to China, are more afraid of what China is going to do than of what China has actually done, is not than so?—Partially, China has done a good deal already. She has already compelled us to accept a price that we never anticipated that we should have to accept.

I think that is an arguable point. Then you also refer to the Foochow Tea Improvement Company. Do you know anything of its working?—I know nothing of their working, but it would be easy to get hold of their prospectus in the city.

Have they got much beyond the prospectus stage?—I understand that machinery has been ordered and sent out to China. I know that.

Then, you alluded to the handicap of the 1*s.* 4*d.* exchange, as against the intrinsic value of silver. May I ask if you have ever studied the question of the copper cash in China?—No, I know nothing of that.

There is a great handicap there. I have heard it said that a few years ago you could get 1,200 copper cash for the dollar, but owing to the depreciation in silver you now get only 800?—I know nothing of China.

(Sir C. Crosthwaite): I understand you to say that in your experience wages have been practically stationary in South India?—Not absolutely, but practically stationary. We pay slightly higher rates than we did.

And you say, also, that the purchasing power of the rupee, as regards the articles consumed generally by the labourers, had remained about the same?—About the same.

That would mean, would it not, that the prices of food grains had remained about the same?—Not necessarily, because you remember that the estates in South India are rather inaccessible, and it does not pay to send the food grains out of the country. In my own district, for instance, the foot of the hills, from which I come, is 90 miles from a railway and the railway is some 150 miles from the seaport, so that the cost of transmission of the grain to the seaport is enormous and they prefer to sell it in the country to shipping it. That is the reason, I imagine, that the food grains have remained stationary; that applies generally to the whole planting District of South India.

That evidence merely applies to a certain tract?—It applies to the whole of the Southern Indian planting districts.

What do your coolies mostly live on?—They live on ragi, cholum, rice, curry stuffs, cocoanuts, and so on.

Is rice exported from that part of South India to Ceylon?—I do not think so. I could not say so with certainty; they may export a certain amount of rice from Tuticorin; I rather doubt it.

Has not the price of rice risen?—Only according to the season. Rice was very high last year.

Over 20 years, has there not been a great rise?—Not a great rise. Understand, I am speaking of South India, our planting district.

I understood you also to say that there has been no alteration of Indian prices owing to the variations of exchange?—The prices of our produce, do you mean?

Yes, the prices in India of produce?—Our produce in South India is not sold in India. We send it all to England. I do not think I could have made that statement.

You did not make it with regard to produce in India generally?—With regard to tea, certainly not. There has been a great fall.

(Sir D. Barbour): I think you said that the value of the tea and cinchona and coffee estates in South India was about 13 millions sterling?—Yes.

Do you know how they were valued?—By the South India Planters' Enquiry Committee—a Committee appointed by the Viceroy to enquire into the grievances of the planters of South India.

What year was that?—It was in 1896, I think. They took infinite pains with that enquiry.

Was that the market value at the time, or the cost of creating these estates?—I conclude it was the market value at the time.

You are not certain of that?—Well, the method in which they arrived at their valuation was to send round a series of questions to every planter in South India, requesting him to state the value of his property, and the wages he paid, and the percentage he made on his capital, and so on, and return the questions with the answers to the Committee, and then they formed their own opinion on the subject.

Every man values his own property?—I think so—yes.

So that we may assume that he did not put it too low; that would not be his interest?—Well, I should imagine his interest was to tell the truth, as every gentleman's is.

I do not accuse anyone of intentionally over-valuing his estate, but there is no reason to think that the value was put too low?—I should think in many instances it was put too low. I should imagine decidedly so, but I should imagine what was really done—I certainly did it in my own case—was to put the true value, and I know I could have put it at a higher price.

You put it at its market value?—I put it at what I considered its market value.

Is your own personal industry the production of tea, or tea seed, or both?—Both.

You said you thought the fall in exchange had not kept the rupee price higher for the person who used imported goods. Do you think that that can possibly be the case?—I think so, and I think you will find the figures I have given in my statement are correct.

I am not challenging those figures, but would not the rupee prices have been higher if the exchange had been lower? Must it not necessarily be so?—It depends what you mean. If you mean that rupee prices would be higher now than they would be 15 or 20 years ago, I should be inclined to dispute it.

I do not mean that?—If you mean that the prices would be, say, lower in 1897-98 than they were in 1890-91, I should be prepared to accept it.

I do not mean that either. I mean that if the rupee price of an imported article is 100, with the exchange at 1*s.* 4*d.*, it must been something more if the exchange was 1*s.*?—Quite so, but I t it requires some qualification, because the argument so far, by Government of India, has been that the importer now has to p far higher price than he had when exchange was high. That is the case.

I do not think the Government of India have said that?—Y have it here in black and white. "A country as a whole make gain in its international trade by a depreciation of its standard, higher prices received for exports being balanced by those of ports." That is what the Government of India stated, but hig prices, owing to the fall of exchange, have not been balanced in way, because in 1875 exchange was high, and yet the price of g in 1892 was considerably lower than in 1875, so that the argum does not hold good.

But the Government of India were dealing simply with the q tion of exchange. If the exchange is low the exporter gets a hig price, but the importer has equally to pay a higher price?—Tha a *sine quâ non*, of course, but you must remember that the im trade in India is insignificant comparatively with the export tr

I do not know that it is comparatively insignificant, but the q tion is this, that if exchange is low the importer must pay a hig price than he would have done if the exchange were high?- course he would.

You said you thought silver was a better standard than gold Undoubtedly.

Why is it better?—Because the goods of India compete with th of other silver-using countries, and if you are going to have a fi standard in gold you immediately handicap the Indian producer.

If the other country issued inconvertible paper, like Argent and caused a fall in the exchange, how would you meet that c petition?—I am not a currency expert, and I cannot answer questi of that class. I only know that provided there is a fixed curre in India, and we have to compete with China and the Straits other countries with ordinary standard, we are handicapped trem dously.

Do you think it is a permanent handicap?—Undoubtedly.

Why would it be so?—I think if India has a gold standard will import very much less silver, and so much more will go on market that prices will run down, which will give a bonus to ot silver-using countries.

Do you not think that wages as well as prices will rise in th silver-using countries?—No, I do not think there is any reaso suppose so.

(Sir J. Muir): I think you mentioned that you considered t you had retired from India for good?—I had not intended going ba

But now you feel that you will be compelled to return to India I know I shall.

Why?—Because I cannot live in England.

Why?—Because my income has been so reduced that I can afford to live here.

Reduced by what?—By the depreciation of the rupee, by t tampering with the exchange.

Then you feel, as it were, that you have a grievance against Government of India?—I think I have a most decided grieva which is shared by all producers.

It is shared by the planters of Southern India?—I know it is sha by all planters, and I am quite certain that if it were understood the natives, it would be shared by the natives. Unfortunately in I this sort of information very slowly percolates to the small produ and he does not understand the mischief that is being done him. soon as he gets to understand it, I imagine it will be a serious mat

Can you tell us about how much capital has been invested in in South India?—I should think about £3,000,000 sterling.

You have referred in strong terms to the effect that this polic the Government in closing the mints, and fixing the rupee at 1*s.* will have on you personally. Now, are you anxious lest y estates in South India should become unremunerative?—Tha what I fear.

Not merely that they may not give you any income on whic live—— ?—What I fear is that I shall have to put into my esta in order to keep them going at all, the income that I have out my estates altogether. I fear that my income will be less than expenditure on the estate.

Then, with regard to the other planters who have solely t estates to depend upon, who perhaps may be financed by house Madras, or it may be in London, what will be the effect upon th

The estates will be taken over eventually, I imagine, by the firms who financed them. That happened before in the case of the coffee disaster in Ceylon; the estates which got involved to the coast firms were taken over by the coast firms, and there was widespread ruin among the planters.

We had a very leading banker before us recently who spoke of his action of the Government of India as being, in his opinion, arbitrary and despotic—do you share his views?—I not only share his views, but it seems to me as absurd for the Government to try to artificially fix the value of the rupee as it was for James II. to melt down brass cannon and coin them, and call them shillings. You will not get the outside world to accept your artificial standard. You appreciate the coin beyond its full value, but the world will not accept it; it can only circulate in the country; it would probably cause a revolution in any other country but India that undertook it.

You mentioned, in addition to tea proper, that you were a producer to a considerable extent of tea seed?—Yes, I am.

And that you had found it impossible to sell any of your seed for next season?—Yes.

You talk of that as an indication that the planters of South India have got frightened at the prospects of their business being seriously imperilled?—I think that is the reason entirely. I know of no reason for it otherwise. I have been able to sell before. I cannot sell now.

Do you sell it entirely in Southern India or in Ceylon partly?—Entirely in South India.

Your estates are in Travancore?—Yes.

The planters of South India seem to feel that they have a strong grievance against the Government of India in consequence of this arbitrary proceeding. Have they suggested any means whereby they might get relief from this injury that they are sustaining?—The planters of South India are perfectly willing, should the Government of India find it necessary to make good the deficit, to submit to an export duty on their produce in order tc make good any deficit there may be. But in saying that, of course, they assume that it would be put on the produce of India in general; I mean on all produce, wheat, jute, hides, and everything.

Have you considered the question as to an increased tax on imports?—I do not think that you could do it by increasing the tax on the imports. There is already a five per cent. import duty, and it seems to me only fair that if revenue is required, it should now be raised from the exports.

(Chairman): Who pays the duty that is put on the exports?—We do not pay any now.

But suppose a duty were put on exports, who would pay it?—I suppose the producer.

Do you think so? Suppose Government put a duty of 2*d.* in the pound on tea exported, who would pay that extra 2*d.*?—I suppose as it was sent from the port of shipment——

I do not mean to say who would find the coin, but who would be the ultimate payer? Would not that increase the price of the tea in the London market?—I do not think it would, because you have got China as a factor.

But you must pay it on all exports?—I mean Indian exports.

You propose that the London consumer shall be liable to have the price of his tea imported from the British Empire raised so that he will have to pay a higher price for it than if tea were imported from China?—I do not think he would have to pay a higher price for it myself. Because I think if we had a very small tax, say 3 per cent. on tea, our price in London now would be sufficient to cover it.

Do you mean that you have such a large margin that you could afford a duty of 2*d.*?—I did not say 2*d.*, I said 3 per cent.

But the principle is the same?—Hardly, because at present we are paying a duty of 40 per cent.

(Sir J. Muir): In reply to the Chairman you are making a comparison; that is to say, you and the planters of Southern India consider that you are practically loaded just now by a heavy duty in respect of this 1*s.* 4*d.* exchange, and that suppose a 3 per cent. duty were put upon you to meet the Government budget——?—It would be infinitely preferable to paying the disguised duty that we now pay.

(Sir F. Mowatt): You said that the effect of the change from a silver standard to a gold standard in India was so severe, that if it had been applied to any other country it might have caused a revolution?—I did not say that, I think. I said that the artificial raising of the rupee, I believe, in any country that had the intelligence to understand what effect it would have would have caused a revolution. I believe that such a measure of legislation would have been absolutely impossible in this country, granting that this country had a silver currency. I do not believe it would have been possible to have done such a thing.

But there has been a change from a silver standard to a gold standard in Germany, has there not?—Yes; but I was speaking of the artificial appreciation of the currency, not of the introduction of a new standard. I said the artificial appreciation of the currency, supposing you have a rupee at 2*s.* and you arbitrarily call it 2*s.* 6*d.*, I say that would cause a revolution. I say that the introduction of a gold piece to represent 2*s.* would cause a revolution.

(Chairman): You object to a gold standard for India, because it would put India into such a disadvantageous position in competition with silver-using countries?—Yes.

Are you aware that 80 per cent. of the trade in India is done with gold-using countries?—Yes, I am.

How would that affect your opinion?—Whether you introduce gold or not, our wages must be paid in silver. As I understand it, this gold is not to circulate, it is to be hoarded.

That is not the point; that is a detail of one scheme. I understood you to say that you objected to a gold standard for India altogether, no matter how worked out, because it would put India at a disadvantage with silver-using countries?—Yes, because we compete with silver-using countries.

And you compete with gold-using countries?—No, we do not compete with gold-using countries, we compete with silver-using countries. Our goods are almost all sent to Europe.

To gold-using countries?—To gold-using countries, and are sold in gold-using-countries; but we compete with China and the Argentine.

But you compete with China so far as tea is concerned in London?—No, we compete with China so far as tea is concerned in China.

But you send your tea to London, and they send their tea to London, and you beat them because you have a better article which you sell at a lower price?—But the China producer can buy more silver than I can; therefore he has an advantage. I compete with him in his own currency.

You say you are not a currency expert, and you need not answer this unless you like; do you not think that the standard of value and the medium of circulation should be liable to as few fluctuations as possible?—Yes.

Then putting the Government out of the question, let us take the enormous fluctuations in the price of silver?—I quite admit all that, but there have been many factors to make silver fluctuate. If the Government of India would adopt the policy suggested, if they would reopen the mints, undoubtedly silver would fluctuate at first, but I believe the rupee would gradually steady down, and keep its relative value with silver.

Is not the price of silver affected by the cost of its production, and the increase or decrease of its supply?—Yes, but there is no reason to suppose that its fluctuations would be any more violent than those of any other product. The mistake that has been made is looking on silver as silver. If you would only look upon it as a marketable product just as tea or jute, or any other product, there is no reason why it should fluctuate more violently than any other product.

You say that an artificial coinage would be of no value outside India?—No.

I agree, but how do you apply that to the artificial coinage that we have in this country?—How do you mean artificial coinage in this country?

What is the intrinsic value of our shilling?—It is not the coinage of the country—it is not the standard.

I know. We have a gold standard, but we have a token currency?—You have a token currency, and by law you cannot pass more than a certain quantity of it—forty shillings. A shilling is not worth the twentieth part of a sovereign.

Does it not circulate as the twentieth part of a sovereign?—Only by law.

No, there is no law which enables you to get gold for silver?—There is a law which prevents your tendering more silver than the receiver likes to have, which practically amounts to the same thing.

Practically the shilling does circulate here, although it is a token coin?—It circulates as a cowrie does in India. You find in India the cowrie used as a medium of circulation, but it has no value.

My point is that all token currencies partake of that element?—Yes.

Now you said that there was a loss to the native by a high exchange?—By an artificially high exchange.

Where does that come in?—He receives less for his produce.
Would not that mean lower prices?—Where?
If he has to sell?—He gets less if he has to sell.
But you said prices had not changed?—No, I beg your pardon; I qualified that statement by saying that the prices that our labourers pay have not changed. The produce they use for subsistence cannot be sent out of the country owing to the enormous cost of transport; they have no means of sending it. It is a curious fact that in our hills the prices of grain have kept steady; but if you take rice that is sent down to the coast the price has risen enormously.

THE EVIDENCE OF MESSRS. CHRISTIE AND LEAKE.

THE following is an analysis of the evidence given before the India Currency Committee by Messrs. Thomas North Christie and William Martin Leake, of Ceylon:—

Mr. Christie has resided in Ceylon for 24 years, and owns tea estates and other property there; represents Chamber of Commerce of Ceylon and Planters' Association of Ceylon. Mr. Leake is Secretary of the Ceylon Association in London.

General information and statistics as to tea planting in Ceylon:—Tea planting is the chief industry of Ceylon. Tea planting was introduced after coffee had failed; Tea planting has grown very rapidly; Tea companies and private producers; the wage-earning labourers are Indian coolies from Madras; women and children, labour of; Acreage now under cultivation; there is now little land available for the extension of tea cultivation; Annual production of tea in Ceylon; Price of Ceylon tea landed in London has fallen of late; Exports of tea from Ceylon; Overproduction of tea; Profit on production of tea, and dividends earned by tea companies; Capital value of tea estates in Ceylon; While exchange was falling the capital value of tea estates rose.

Currency of Ceylon:—Currency of Ceylon is the Indian rupee with local subsidiary decimal coinage; Indian currency was voluntarily adopted by Ceylon; Practically impossible for Ceylon to adopt a different standard from that of India.

Influence on Ceylon of fall in exchange before June, 1893:—Prosperity of Ceylon before June, 1893; Fall in the exchange value of the rupee benefited producers, because produce is sold for sterling, and expenditure is fixed in rupees; Wages did not rise in Ceylon while exchange was falling; The market price of the rice which the tea planters supply to the coolies at a fixed rate has risen slightly; The fall in exchange did not necessitate increased taxation in Ceylon nor cause embarrassment to the Government of Ceylon; Direct taxation in Ceylon is light.

Fluctuation in the exchange value of the rupee:—Fluctations in exchange unimportant; Fluctuations in exchange do not prevent the influx of capital.

Effects on the Ceylon tea industry of the closing of the Indian mints: (1) Direct effect: the cost of production is increased in consequence of the rise in the exchange value of the rupee, because that part of the sterling price which is remitted to India to pay wages, &c., realises fewer rupees, (2) Indirect effect: tea-producing countries which are on a silver basis are favoured in competition with Ceylon, by the divergence between the value of silver and the exchange value of the rupee; Competition with China: before the closing of the Indian mints, Ceylon, competing on equal terms with China, drove her out of the English market, nor is it feared that she will regain that market, but the closing of the mints has prevented Ceylon from driving her out of other markets; Duty on tea in China: Competition with Japan: Japan benefits in competition with India and Ceylon, in consequence of the low value at which silver is rated in the Japanese currency.

The disadvantages under which Ceylon labours in competing with countries on a silver basis have compelled the Ceylon planters to accept a lower price for their tea; Stringency of the money market in Ceylon; The effect of the closing of the mints were at first slight, but since the exchange value of the rupee has reached the vicinity of 1*s.* 4*d.* the profit on cultivation has decreased, capital has left Ceylon, and the extension of cultivation has been checked; Owing to the conditions of the production of tea, the effect of diminution of profit in checking exports shows itself slowly.

The present currency system in India and proposed modifications:—A continuation of the present currency system in India would strangle the producing interests in Ceylon; Objections to the proposals of the Government of India; Objections to a gold standard which would artificially raise the value of the rupee.

Views of witness as to measures that should be adopted reversion to a system of currency based on the bullion val silver would be revolutionary; Witness is in favour of re-ope the Indian mints and imposing a fixed import duty on silver a fixed seignorage on the rupee; If an import duty were impos India, the Ceylon tea planters would be willing to bear a sir duty.

Amount and nature of Ceylon's gold obligations.
Balance of trade between Ceylon and Great Britain.
India does not lose by a fall in exchange.

POINTS FROM THE FIRST BLUE-BOOK.

REVIEWING the first Blue-book on the evidence taken be the Indian Currency Committee, the *Times* thinks that, bro speaking, two facts stand out in relief—that the great majorit the witnesses consider it impossible to reopen the mints to sil and that the plan of the Indian Government, though not defin condemned with as much decision as the re-opening of the m does not meet with hearty approval from any except members o official class. The evidence of Mr. Alexander Martin Lind Secretary and Treasurer of the Bank of Bengal, occupies more s than that of any other witness before the Committee. Mr. Linds plan was gone into at great length, and nearly all subseq witnesses criticised it. Clever as the plan was admitted to be, it regarded as unworkable by the majority of the best judges, inclu Lord Rothschild, Sir Samuel Montagu, and Mr. Raphael. Sir Ed Vincent favoured the Lindsay plan, but with modifications, wi altered it considerably. Mr. J. E. O'Conor, the Director-Genera Statistics to the Government of India, supplied the Committee a great deal of valuable evidence respecting the effect, or absenc effect, of the closing of the mints on the trade of India. The fol ing extract from his evidence refers to the tea trade:—

879. Has the fall in the price of tea been in any way caused the closing of the mints and the rise in the value of the rupee do not find any evidence that that is the case; but there is a g deal of evidence to the effect that there has been for the mon what is called over-production—that is to say, that the produc has outstripped, for the time being, the demand.

880. (Sir D. Barbour.) Do you point to that as the cause of fall in price?—I should feel inclined to do so.

Those who wish to see what the tea interest has to say on this p should read the evidence of Mr. Granville Lowther Acworth and Messrs. T. N. Christie and W. M. Leake, who represent South India and Ceylon. These gentlemen admitted that the quantity tea sent from Ceylon has continued to increase since the closing the mints, but complained that it has prevented them from mak progress in the United States and Canada. Their evidence is gi in the following passage, the questions being put by Sir H. Fowler

4542. I am old enough to remember when the proportions between India and Ceylon and China were eighty and twenty; no think it has turned gradually round, and in round figures the proc tion from India and Ceylon is about 80 or 89 per cent. of the whc —It is about nine-tenths.

4543. With China your competition is increasing. You are hav more and more year by year the command of the market?—No, not that?—Up to the closing of the mints we were on even te with China and we drove China practically out of the Eng market.

4545. The closing of the mints has not aggravated your c petition?—Oh, yes greatly.

4546. I went you to show us how. Let us take the two conc cases, China and Great Britain. Great Britain buys from you n than she buys from China. Why? Because you sell the article at the lowest price?—Yes, I should think that is it.

4547. Then you have the upper hand of China in that respect No, not necessarily. The consumer, I think, might consider tha would get better value for his money when China is offering at and ours at 6½. He may have thought so when China sold at a hig rate relatively, but when China tea can go down, and we cannot must suffer. But I do not fear for the English market to any g extent. We shall keep China out of the English market now bec we have driven her out. We have disturbed the usual line trade as regards England and China, and one does not fear t unless something serious happens to British grown teas, China ever again reassert herself in England. But our great and incr ing production hoped to find a number of other markets where C

as an enormous hold, and we had expected, and I think with some justification, that if we competed with them on even terms we should have done very much the same in those other markets as we did in the English market—to the detriment of China and Japan, no doubt, but to the benefit of our colony and therefore of Great Britain. The exports from China to the United States and Canada are still over 0,000,000 lb. We have made comparatively little progress there. During the last year we have made very little impression. Yet we are dealing with English-speaking people, people in intimate relations with ourselves, and we say our progress ought to have been very much greater. What is the reason of our failure? China can put her tea into those countries at $3\frac{1}{2}d.$ or $3\frac{3}{4}d.$ a lb., and we cannot do the same, and consequently the consumers there consider that they get better value for their money. They do not necessarily consider that China tea is better than Ceylon tea, but at the price at which the two can be offered to them they think they are getting better value for their money. The same thing applies to Russia. The export from China to Odessa only, not counting what goes through London, which is a very large quantity, is 22,000,000 lb. We have made very little progress there during the last couple of years.

The evidence of Mr. J. Finlay, Secretary to the Government of India, in the Finance Department, expresses in detail the views of the Indian Government in which the adoption of a gold standard is proposed. Sir A. P. MacDonnell, Lieutenant-Governor of the N.-W.P., expressed the opinion that in the region with which he is concerned the volume of currency has been ample ever since the closing of the mints.

On the other hand, Mr. Stephen Ralli's view is that trade has been interfered with since 1893, by a deficiency of currency. His evidence goes to show that latterly there has been proof of the scarcity of rupees.

The conflict of evidence (says the *Times*) between Mr. Ralli and Sir Patrick MacDonnell is probably susceptible of reconciliation if we note that Sir Patrick appears to be speaking of the native population of rural district, while Mr. Ralli seems to be thinking of the monetary difficulties of a more wealthy class of traders, native and European, which were, no doubt, severe.

Mr. Henry Lewis Raphael said that "the closing of the mints was the result of fright."

In reply to the question whether a gold standard is possible in India, Mr. Raphael said that in order to establish it the Government must reduce the silver in circulation, since, as he tersely put it, a gold currency means that all large payments are made in gold, and that silver is confined to token money for small amounts. He believes as the population grows up and as India increases in prosperity, and as her trade increases, it will not only be undesirable to decrease the silver circulation, but it will be expedient to increase it. Therefore he is against any system which decreases the silver currency. Mr. Raphael had a plan of his own, the general effect of which would be that the Government should, through an office in England, always buy and sell transfers at 1*s.* 4*d.*, charging $\frac{1}{2}$ per cent. commission. This, he thought, would fix the exchange. A reserve would have to be kept in England, partly in gold "to be acquired by degrees" and partly in the form of "a credit to issue from time to time up to £15,000,000 of Treasury bills."

Mr. Raphael's views were criticised by Sir Samuel Montagu, who was in favour of "going slow." Lord Rothschild and Sir Samuel Montagu were in favour of a cautious modification of the *status quo*, and they both pointed to the example of Russia as the proper mode of arriving at a gold standard. They both also pointed to the rapid annual increase in the production of gold, which would, if it continued, as was probable, greatly facilitate the task of the Indian Government in gradually establishing a gold standard. Sir Edgar Vincent also laid stress on this point.

LEAF-DISEASE.

THE following is a full report of the very interesting discussion on Leaf-Disease that was held in Committee during the last Annual Meeting of the U.P.A.S.I. on 10th ultimo. We reprint Mr. Harris' open remarks and Mr. Cameron's final speech—both given in open meeting—so that the sense of the report may be complete :—

On this subject, before the meeting resolved itself into Committee for an informal discussion with Mr. J. Cameron, Superintendent of Mysore Government Gardens in Mysore, Mr. J. A. HARRIS (S. Mysore) made the following explanatory statement :—"I am pleased to be able to report that in Mysore during the past year we suffered comparatively little from *Hemeleia vastatrix*. Its presence was noticeable throughout the monsoon and up till the end of November, but it never assumed a virulent form and gradually passed away. We had a very dry season, no rain falling from the end of October till the beginning of April, save some slight showers late in December, and to this no doubt was due the subsidence of the pest. But though these droughts, to which Mysore is subject, and the comparative isolation of the estates are a great safeguard against the spread of the spores, and practically assure us from the disastrous results which took place in Ceylon, we are still left to face the fact that in seasons favourable to their development we shall probably continue to suffer serious losses. We must not, therefore, allow the comparative immunity of some years to make us oblivious to danger. The discussion at our last meeting, though the object some of us strove for was not achieved, has not been altogether fruitless, as we shall hear later on when the Agricultural Chemist question is discussed. Mr. Graham Anderson, in an exhaustive paper which he has laid on the table, has referred in his preliminary remarks to the criticism to which my views were subjected. Well, criticism is most wholesome, but I regret to have observed in some quarters an inclination to decry the consideration of such subjects as *Hemeleia vastatrix* at our meetings on the ground that it is unwise to announce their existence, as by so doing our industry is prejudiced and its financial position compromised. I venture to make a protest against this view. In the first place there are other sources of information besides the Reports of the U.P.A. Meetings, and if there were not short crops would reveal the situation. In the second place, I maintain that our industry so far from being discredited by such discussion will gain in estimation, as it will be seen that we are alive to dangers common to all agricultural enterprises, and are striving to mitigate them. In the third place, I say that if scientific investigation, as we called it last year, were to be excluded from our Agenda paper, the U.P.A. would be deprived of one of its most important functions, namely the holding of deliberations regarding matters which vitally affect our industry. And, lastly, I assert we have a perfect safeguard against our industry being depreciated in these discussions, in the fact that self-interest ever prevents a man from running down that on which his own prosperity depends."

As there was no formal motion before the meeting, Rule 22 was by consent suspended to make Mr. Harris' speech in order.

(IN COMMITTEE.)

Mr. PARSONS (Coorg) :—Recently, since the last meeting, Mr. Cameron has made a tour of inspection through Mysore and has sent in a report. I should like to ask him whether, as a result of his observations, he thinks that leaf-disease has been less than in the previous year.

Mr. J. CAMERON :—I made a tour in February, 1897, through the Munzerabad District, but there was not much disease. I went over a number of estates and saw little disease at the time. But I hear through planters with whom I have been in correspondence that what Mr. Harris says is quite true, that the effects of leaf-disease are not nearly so great this year as one would be led to expect from what one saw last year.

Mr. H. G. PARSONS (Coorg) :—In your report, which I read with interest, you say you saw Mr. Brooke-Mockett's hybrid coffee bearing a fine crop. Have you any information with regard to what the crop was? Have you any further information as to the results achieved?

Mr. J. CAMERON :—I have no direct information other than that

I received from Mr. Crawford or Mr. Mockett, but I believe the hybrid coffee bears very well indeed.

Mr. H. G. PARSONS:—Would you be inclined to suggest that the line taken by Mr. Brooke-Mockett is one clearly indicated to all? If so, do you think we would be great gainers if we went to a certain amount of expense to try and carry out systematically what Mr. Mockett has done more or less by a fluke?

Mr. J CAMERON:—I do. Personally, I am much in favour of hybridisation. I think that if you go into the thing on a small scale, you will find that in course of time something good will come out of it.

Mr. J. A. HARRIS:—How long do you think it would take to establish the result of these experiments?

Mr. J. CAMERON:—About six years before one could prove what kind of cross it was. In this connection I may tell you that I have started a small experiment of my own in the Lal Bagh. I have about 130 bushes, in three different kinds of coffee, under irrigation. When these begin to flower, I shall at once begin to fertilise, and when, after being fertilised, these plants come into fruit, I shall be able to cultivate and judge the results of hybridisation. In this case it would not take more than three or four years. I don't mean to say the most favourable results will come from these young plants. I think, perhaps, that the experiments should be made with older plants and not with young seedlings. Of course, there may be results from seedlings giving their maiden crop; but it is a good deal more probable that better results would ensue from plants of ten to fifteen years.

Mr. J. G. HAMILTON:—I do not think you have quite answered what Mr. Harris intended to ask. What Mr. Harris wanted to know was, how many generations it would take to fix a type. What you have said points rather to the fertilisation of seed every year.

Mr. J. CAMERON:—It is not necessary to fertilise every year.

Mr. J. G. HAMILTON:—It is said that the second generation has a tendency to revert to one type or another.

Mr. J. A. HARRIS:—In how many years would the new types cease to throw back, because some who have studied the matter closely say that it takes from 20 to 30 years to fix a type.

Mr. J. CAMERON:—That is difficult to say, but certainly it is not 20 or 30 years. It may be a matter of six years in the first experiment; from which you may get a type of coffee that suits all your requirements. You may, on the other hand, get many unsuitable types.

Mr. H. G. PARSONS:—Would it be possible for us as amateurs to select these hybrids?

Mr. J. CAMERON:—I think it would.

Mr. GRAHAM ANDERSON:—With regard to Mr. Brooke-Mockett's hybrids, I may say that the experiment has now entered upon its second phase. He has got now trees which he has named the Improved Nak Nad and others the Improved Coorg. It is really wonderful what sports these hybrids have produced. By a system of careful management, he has picked the fruit of all the second generation of a promising nature and has planted the seed separately in marked baskets, and so this very useful experiment is proceeding. In regard to a number of trees, some are true to the parent stock, and others are sports or different strains altogether. He had an idea that if he kept the different strains separate and planted them out under auspicious conditions, it would be possible to perpetuate them. Mr. Brooke-Mockett's manager is an extremely clever man and has taken a great interest in this experiment. He has now got to the stage that when the young seedlings have grown to a certain extent, he is able to discriminate between them and say that they will be in accordance with one type or another.

Mr. J. CAMERON:—I am delighted to hear it. I had no idea that Mr. Brooke-Mockett had gone into the matter so fully.

Mr. H. G. PARSONS:—Mr. Cameron, I would like to have a straight answer to this question. Is it your opinion that strains of seed are deteriorating?

Mr. J. CAMERON:—I think it must have deteriorated, for reason that you have been going on with the same class of co for the past 40 or 50 years. You would do better by get fresh seed from outside. Any kind of cultivation that goe for a long period without change must gradually deteriorate, a time will come when sterility will set in.

Mr. F. J. PARTON:—Can you not increase fertility by care cultivation?

Mr. J. CAMERON:—You can increase fertility by a care selection of the seed, choosing large and heavy beans, & but that alone will not do sufficient good. Selection come good deal lower than hybridisation as a means of improv your crops.

Mr. J. W. HOCKIN:—As we have had considerable experienc hybrids in Wynaad, the meeting may like to hear of it. Abouth a dozen hybrids, discovered accidentally, are now large trees be ing crop. Two are, I believe, no good, as the crop generally fa The others are grand trees filling a space about nine feet cub five or six years of age, and bearing heavily without any sign leaf-disease. They have, of course, been taken every care of manured heavily, but even so, the growth and vigour is very markable. Their seed has been used for planting out. So gentlemen tell me about 15 to 25 per cent. of the second generat come true to type; but one gentleman has a clearing in which says all but a small percentage are good vigorous trees free fr leaf-disease, though not all, I take it, of the same type as the f generation. It will probably take a long course of careful se tion to establish a fixed type. I myself had Liberian nurse for five years without finding a hybrid. Last year I fo three hybrids, which were easily distinguished, as they were feet high when the Liberian plants were only one foot hi The rapidity of the growth of the hybrids is very remarka At two years *from seed* my plants have the following measuremen one $6\frac{1}{2}$ feet high by 5 feet across; one $5\frac{1}{2}$ feet high by 6 f across; one 5 feet high by $5\frac{1}{2}$ feet across. The second tree a few berries on it. All hybrids of whatever generation v grow when it is quite impossible to get Arabica supplies to gr I had another experiment which promised well, but turned a failure. In the parchment coffee, picked from Arabica w Liberian coffee growing in it, I found a considerable number very large canoe-shaped beans. These from their extraordin size I concluded must be hybrids of which Liberian was the fath and Arabica the mother plant. I thought this an extraordinar good discovery, as I had a very large bold seed with a go Arabica colour and appearance. Unfortunately, the pla raised from these seeds got leaf-disease as badly or worse th ordinary Arabica, and turned out of no value. This would se to prove that the vigour to resist leaf-disease only belongs hybrids of which Liberian is the mother plant.

Mr. H. G. PARSONS:—Are we quite right in selecting Liber as a means of improving our strains, or would you suggest a other varieties?

Mr. J. CAMERON:—It is difficult to say. I do not know that have had enough experience in the matter.

Mr. H. G. PARSONS:—Are there any other strains?

Mr. J. CAMERON:—Oh yes, there are the varieties that can got from Jamaica, Johore, Mocha, and West Africa.

Mr. H. G. PARSONS:—But these must all have come from Ara originally.

Mr. J. CAMERON:—Possibly in most cases; but it must ha been so long ago that they are bound to have incurred so sort of change from the original type.

Mr. E. G. WINDLE:—In Jamaica, as far as I know, coffee d not suffer from leaf-disease; but with us Jamaica coffee suff almost as badly if not worse than the other varieties.

Mr. J. CAMERON:—It must have acquired the disease.

Mr. J. W. HOCKIN:—I tried imported seed once. I get real ocha coffee from Jamaica, not that sold in London as Mocha, t what is known in Botany as Mocha, which has a very small an—no larger than a split pea. It was planted alongside Arabica d did far worse. We have tried Java, Blue Mountain Jamaica, abica, Pulney, Maragogipe and other varieties, and with the ception of Nalknaad and Liberian, I believe every imported riety has suffered far more from leaf-disease than the indigen- s variety. The only benefit we ever derived from change of seed as by getting carefully selected seed from the best plantations in r own or neighbouring districts with a slightly different climate, il and elevation. The benefit was derived as much from the perior vigour of the parent trees as from the change of condi- ons, I think. I believe if we could once get rid of leaf-disease, e should find coffee well manured or growing in rich soil would op as well as ever. My reason for so thinking is that, when- er we get a season in which leaf-disease is in abeyance, our esent coffee crops very well.

Mr. SPROTT:—Have you any experience of *Coffee stenophila?*

Mr. J. CAMERON:—It did not succeed with me, so I sent the maining seedlings to Coonoor. I was reading a valuable count of it the other day in the *Kew Bulletin.*

Mr. SPROTT:—I have some sent out to me which has been ported on favourably. It seems a vigorous variety, almost of e same type as the hybrid between Arabica and Liberian.

Mr. GRAHAM ANDERSON:—When in London the other day I ade a point of going to Kew to make enquiries about it; but r. Thiselton Dyer said he could not give me any information. s I was leaving, however, he sent after me to say that a gentle- an who lived in the place where *Stenophila* grows had come in make enquiries about machinery for pulping Liberian coffee. had a very interesting conversation with him, and he promised send me some *Stenophila* seed in exchange for the seed of some ick-growing shade trees. He said that *Stenophila* was a quick rower, and in its own country grew at a low elevation. I may ention that the gentleman in question was the Botanical irector of Sierra Leone.

Mr. CAMERON:—It grows wild at sea level, but in its wild ate it is not productive. Under cultivation, however, it gives xcellent results.

Mr. H. G. PARSONS:—Liberian seems to me to be the rongest plant constitutionally that we have.

The CHAIRMAN:—As far as that goes, my experience is that hen leaf-disease attacks Arabica, it destroys the chance of a op, but when it attacks Liberian it kills it bang out.

Mr. J. W. HOCKIN:—As I said last year I have had a good deal experience of Liberian, both healthy and diseased. When iseased I always find that it begins to die from the top, the young oots turning red long before leaf-disease touches the leaves. he tree behaves as if it had canker. I think it is some damage the bark or root which causes the sickness. Once the tree gets ck, it gets leaf-disease worse than Arabica, loses all its leaves, nd often some or all of the branches die back, and sometimes e stem too. I think the reason for the sickness is that Liberian ves a mild, equable climate, and dislikes equally the long rought and heavy downfalls of rain it is subject to in Wynaad some seasons. My own Liberian, which is now six years' d, is grown principally on cool slopes under high shade, and is ite healthy. Some suffered last year from the excessive wet the monsoons of 1896 and 1897, but has quite recovered this ar. Some suffered last hot weather from drought in a hot nsheltered flat, and I had to mulch the trees with cattle anure to save them. They turned brown as if burnt by re. On an adjoining slope with a north aspect and in another ith a south aspect, well shaded, the Liberian did not suffer. great deal of Liberian in Wynaad has been planted in very hot places unshaded, and in places with a retentive clay soil, neither of which it seems to like. On cool, well-shaded slopes, with a good natural drainage, I find it does very well, even when it fails under other conditions.

Mr. PARSONS:—Would Mr. Cameron advise us to plant our estates here and there with Liberian?

Mr. CAMERON:—No, I would not. I was rather amused a short time ago to read a small para. sent to *Planting Opinion.* The writer said that, a year or two before, he had planted Liberian all over his estate with *Arabica,* and he was gratified to find that the Arabica plants had vastly improved—a condition which he believed was due to having planted Liberian. It struck me at the time of reading that he was utterly beside the mark, and did not know what he was writing about.

Mr. J. G. HAMILTON:—I have done that, and found that Liberian blossoms before *Arabica,* and it was improbable, therefore, that a hybrid could result.

Mr. CAMERON:—In my opinion, it is very doubtful if any good could result. Even if the two varieties did flower together, you might get a hybrid here and there; but you would never get any control over the experiment, and the whole thing would become mixed. I must warn you against trying to get hybrids indiscriminately; you may get all sorts of rubbish that will do your estates more harm than good if they are allowed to propagate; and this must be prevented at all hazards. I do advise, however, that whatever is done should be done on a small scale, and systematically. These experiments should not be allowed to intermingle in any way with the regular cultivation, but should be kept separate; the seedlings supposed to be of new strains should be carefully watched, and as soon as they show signs of deterioration they should be destroyed. It is only when you are quite sure that you have got something superior and worth cultivating that you should put it to the test in a separate place, and go on cultivating until you confirm your idea or otherwise.

Mr. PARSONS:—If you saw Liberian growing, could you point out certain trees which you would suggest had better be destroyed.

Mr. CAMERON:—I could not do that until I saw the fruit.

Mr. PARSONS:—Have you had any success with your grafts?

Mr. CAMERON:—I have tried grafting, but can't say that it has been successful.

MR. J. G. HAMILTON:—Some years ago Mr. Cameron sent me some grafts, and the produce seems to be very inferior and not abundant.

Mr. H. O. NEWPORT:—I would like to ask Mr. Cameron whether he can give any reason for the tendency Liberian has over Arabica to be attacked with scale pests. I have noticed that on the Pulneys it appears a month earlier on Liberian than it does on Arabica, and is much more violent in its effects.

Mr. J. CAMERON:—I do not know really, unless it is because Liberian has a more succulent leaf. Mr. Anderson, do you know if Mr. Brooke-Mockett's plants are ever affected by scale pests?

Mr. GRAHAM ANDERSON:—No, they are absolutely free from that sort of thing. With regard to scale-pests: the only scale-pest we have is that which attacks the *Cedrela toona.* It looks like a limpet, and the bark is covered with a white dust and the coffee round it is covered with a black honey-dew. There is one thing to be said about the *Cedrela toona,* and that is that we have tried sulphur and lime as a remedy against the pest and found it very good in the early stages, but whether it is accidental or not I cannot say, because we are apt in these matters to mistake cause and effect,—when we examined the spot, we frequently find in the vicinity the decaying roots of old jungle-trees, covered with fungoid filaments. I have naturally concluded, and I have been borne out in my conclusion to some extent by the report of Dr. Watt, that it is an absolute fact that when a tree gets scale insects combined with other signs of ill-health,

it is caused by insanitary surroundings. I venture to suggest that the presence of a decayed root may have caused a state of ill-health favourable to the invasion of scale insects. I mention this matter that it may engage the attention of planters. Only the other day I cut down a *Cedrela toona* which was attacked with scale. I had it dug out, and set men to find out what was near the hole. There were four large logs absolutely covered with fungoid filaments. We have had the pepper vine attacked in the same way. Some samples sent home to a Professor at Kew have elicited the opinion that it is due to some subterranean fungus which attacks first the trees which supports the vine and then the vine itself. It is much the same as stump rot, which every planter has noticed, the worst of which is that once you commence to cut down the jungle-trees which are liable to it, you get a ring of coffee all round dying out too, due evidently to the same fungus extending from the stumps of the forest trees to the roots of the coffee. With regard to the pepper vine, an extraordinary thing has been noticed in some of our clearings. In planting pepper one naturally looks for straight trees to train the pepper up. One of these, the *Myristica magnifolia*, which is extremely suitable for the purpose, grows all over our forests, and naturally they were trusted as supports for the pepper. The tree, however, has a funny peculiarity: it is extremely gregarious in habit, and will only live in clusters in the forest. Immediately we began to thin them out, the others supporting the pepper began to die out too.

Mr. J. CAMERON:—That is a remarkable confirmation of what I have seen. There were a number of Liberian plants, some of them in the open, others under shade. Those in the open suffered greatly from exposure and want of irrigation, the result being that the trees died back and, in a number of cases, were attacked with leaf-disease. It is quite true that this particular species of coffee requires high cultivation, ample shade and plenty of moisture; but when we give it plenty of shade and moisture, we lay it open to attacks from fungoid disease. The difficulty is to know where to draw the line.

The CHAIRMAN:—There is one question I would like to put Mr. Cameron. When the potato disease was bad in Ireland—I believe the potato disease is similar to *Hemeleia vastatrix*—they imported a blight-proof variety. These were blight-proof for some years, and then the disease adapted itself to the new variety, and now they suffer just as badly as the former potato. Do you not think that this is likely to happen to our coffee, namely that *Hemeleia vastatrix* will adapt itself to any new variety.

Mr. CAMERON:—That is a difficult question to answer. I should suppose that by improving the constitution of any given coffee it would be proof against disease for a long series of years, and eventually the disease would die out. Probably it would. I think that by strengthening the constitution of plants and introducing new strains we might have kinds of coffee which would resist disease to such an extent as to make it practically harmless.

Mr. PARSONS:—Mr. Cameron has told us one thing which is indeed serious, and that is that if we go on as we are doing now, it is quite possible our coffee may become altogether sterile.

Mr. CAMERON:—Yes, if you are going on as you do now. We have in India about 165 varieties of rice planted in different parts of the country, which would indicate that the natives have found out the benefit of introducing new varieties.

Mr. HARRIS:—How about coffee? We never go in for rotation of crops; but we do go on feeding the soil.

Mr. CAMERON:—That is what I say. Going on that principle, a time will come when the soil will get exhausted and you will gradually get less crop. It is not only the soil we have to consider, but the water and atmosphere generally. You have also certain factors which you can never change.

Mr. SPROTT:—I should like to ask Mr. Cameron if he ever noticed some jungle trees affected by fungus very sir to *Hemelia vastatrix*.

Mr. CAMERON:—I can't say that I have ever gone into fully.

Mr. GRAHAM ANDERSON:—I think I can give you some i mation about that. I daresay you mean the form of leaf-dis that attacks the Bungar Sedlay tree. I sent it home in 18 Professor Cook when I was sending the first specimens of disease and other fungoid parasites. His remarks on the su appear in his original work on leaf-disease. If you exa the fungus of Bungar Sedlay under a microscope, you wil that it appears exactly like a volcano containing bright ye dust, whereas *Hemeleia vastatrix* appears like a bundle of croc but to the eye they appear the same. We have fungoid gro on all jungle trees, at some stage or other resemble *H leia vastatrix*, but when they finally develop are entire different parasite. I should like here to give it as my opi that little if any deterioration has set in with regar our coffee. We have coffee in Mysore on some of the old es opened as much as 50 years ago, which is as healthy and ductive now as ever. In addition to this, I believe al original Babubuden temple trees, which are about 150 years' are still to the front. Far from being anxious about the ma there is nothing in the world that I can think of which is hopeful than coffee. There has not been a single horticul arrangement applied to it, and yet we can regard it entire confidence. We should be happy that it is an indu that involves a certain amount of trouble. Otherwise it w be taken out of our hands altogether. (Cheers.)

This brought the discussion in Committee to a close, w general meeting was resumed.

(IN OPEN MEETING.)

Mr. CAMERON made the following remarks:—

MR. CHAIRMAN AND GENTLEMEN,—Before concluding remarks to-day, I should like to thank you for having give this opportunity of meeting you and hearing your views, w were most interesting. When I was here last year we s chiefly on the fertilisation of coffee plants, and I do not know any of us have done very much since then but speak on subject. I don't know at least if any one has acted. In industrial organ, *Planting Opinion*, I published a short artic the fertilisation of the coffee flower, from which you will be to see how crossing is done. Probably some of you have not the article. It was written over the initials "J. C.," as I not sign my name in full. Well, if you read that over a you will see how the process of fertilisation is effected. It very simple one; there is nothing difficult about it. The thing is that we have to wait for some time before we ca any results. I hope all of you, or at least some of you, will g for this and try to assist myself and others to carry out s improvement in the production of new strains of coffee. I quite positive that in this way you will hereafter achieve won ful results. In improving the strains of plants, we are follo very much the same principles as we do when we tr improve breeds of cattle or races of men. The principles entirely the same, only that plants are far more easily impr than cattle or men. But you must be persevering and patience to go on with your experiments quietly and limited scale on your estates till such time as you find you gained something definite, something worth achieving. Th addition to the work of hybridisation you could do a good by selecting the seed. That is a time-honoured practic home, not only by seedsmen and nurserymen, but also farmers and agriculturists of all sorts. In selecting seed will find the farmer is very particular only to have the heav finest and best. And it should be the same with the pla

MANURES.

ish Guano. Steamed Bone Meal. Poonacs:—Castor, Mowra, Hoongay. **Saltpetre, Crude and Refined** (Nitrate of Potash.)
rate of Soda. Sulphate of Ammonia. Sulphate of Potash. Muriate of Potash. Superphosphates. Phosphate Powder. Kainits Salts.

Mixtures can be made in any proportion without extra charge. **Packing** can be done to suit transport by bullocks, etc.
Prices will be furnished on application for delivery either at our Karaparumba Works, Calicut, the Calicut Railway Station, Palghat, Mettapollium, **m, or at our godowns in Cochin, Tellicherry, Mangalore and other places.**
Quotations will be obtained and orders booked for any Manures not kept in stock. F.r.m.

in this country. He should not be satisfied with mixed seed; but should make sure that he has the heaviest, largest and finest in every respect. He should exchange his seed by sending it to other parts of the country to friends and asking them to send him back their specimens of seed equally carefully selected. He should also try and introduce seed from other countries, such as West Africa, Brazil, Jamaica and all places where coffee is largely grown. I don't know that I can add anything to these remarks; but as you seem very keen on fertilisation and seed selection, I think it right to tell you that by means of these two methods a man can do a great deal. Of course, high cultivation you thoroughly understand, and it is needless for me to say much about it. I believe, however, that you are going to bring up a proposal concerning the appointment of an Agricultural Chemist. In this connection will you allow me to say that there are chemists and chemists. (Hear, hear.) If you are going in for the services of a chemist, I strongly advise you to get the very best man available. You will have to pay a heavy sala such a man, but do that ungrudgingly, and your money returned to you twenty-fold. It is no use going to a chea who will make you believe this, that, and the other thi eventually you find nothing good. I strongly advise you the best man possible, and if the Mysore Government other Goverment can help you in the matter, take their h be thankful. I don't think I have anything more to add that I am much obliged to you for giving me a h (Cheers.)

The CHAIRMAN:—I beg to move a hearty vote of tha Mr. Cameron. The discussion has been a most difficult report, but it has been one full of interest to all presen have heard it, an interest entirely due to Mr. Cameron. I thank him for his courtesy in accepting our invitation.

Mr. GRAHAM ANDERSON:—I have the honour cordia second the resolution moved by the Chairman. We

ply indebted to Mr. Cameron for the kindly, courteous and nstaking manner in which he has explained matters to us.

Mr. CAMERON then left, and the discussion was resumed.

After various remarks (reported in our issue of 13th ult.) meeting again went into committee.

(IN COMMITTEE.)

Mr. E. G. WINDLE (Nilgiris):—It may seem ungracious to a word against any proposal brought forward for improving knowledge, but I hardly think Mr. Parsons' proposal is in ordance with the resolution passed last year. I do think that Mr. Cameron's services are given to one district in particular, t district should pay the necessary expenses. On behalf of the giris Association I should not have thought of asking for the 1,000 mentioned. It would have been met by our Association, n though the results of his work were published for the neral good. The published results are not the same thing as actual experiments conducted under your own eye. I do mean to grudge the superior knowledge to be thus obtained Coorg; but I do think that under the circumstanees it is only sonable that the expenses should be borne by them. I would, refore, move as an amendment that the expenses connected h this proposal be borne by the Coorg Association.

Mr. H. G. PARSONS:—One of the first questions I would ask in nection with Mr. Windle's amendment is, what is the object he Reserve Fund? We might have obtained Mr. Cameron's vices without subscribing a penny to the Reserve Fund. We nt Mr. Cameron to come up and see what we have done and ort on it.

Mr. J. W. HOCKIN:—I do not think Mr. Windle has any grounds objecting to Mr. Parsons' proposal. The money was voted last ar, and Coorg is the only Association that has taken the matter and arranged to have experiments carried out systematically der Mr. Cameron's supervision. As it is the only district in this sition, I think it may fairly claim the grant, and we shall all efit by the experiments made in Coorg, if, as I understand is case, the results will be reported to the U.P.A.S.I. If another trict had taken the same trouble as Coorg in the matter, I see it would have a right to claim its share of the grant and . Cameron's services, but as things are, I do not understand v other districts can object to Coorg taking advantage of last r's grant.

Mr. H. M. KNIGHT:—I should oppose the granting of the 1,000, not because I do not want to see Coorg get the benefit it, but because I do not want to see this sum taken out of the serve Fund.

Mr. J. W. HOCKIN:—But it has been taken out of the Reserve nd. We have already passed a resolution to that effect t year.

Mr. R. GOMPERTZ:—Perhaps a method of getting over the ficulty would be if the plants raised were ratably distributed ongst the subscribing Associations.

Mr. GRAHAM ANDERSON:—I think it would be the greatest y in the world if there was any difficulty about sanction- this matter. We personally in Mysore are under the atest obligations to Coorg for having helped us to introduce fee plants and for having done so much for the province. I nture to think that Coorg offers special facilities for an periment the nature of which we have been discussing. They ve an immense amount of coffee centrally situated, and it uld be a great pity if we raised any objections to the payment this little sum out of the funds of this Association, because elieve that once we subscribe, the subscription is for the com- n good. What takes place in Coong will, I am convinced, be the common good. (Cheers.)

Mr. W. H. SPROTT:—I think that in one way we are specially uated. We have a better chance of getting the services of . Cameron than any other district except Mysore.

Mr. E. G. WINDLE:—I beg to withdraw my amendment.

Mr. H. G. PARSONS, in deference to what had transpired in the above discussion, amended his resolution as follows:—

"That the resolutions passed last year for obtaining Mr. Cameron's services be put into force and that, if permitted, he be deputed to visit Coorg, the results of his investigations to be reported to the U.P.A., provided his expenses do not exceed Rs.500."

The resolution was carried in Committee, and seconded by Mr. J. W. HOCKIN was affirmed in general meeting.

DISTRICT ASSOCIATIONS.

COORG.

Proceedings of a General Meeting of the Coorg Planters' Association held on 27th July, 1898, at the Bamboo Club, Pollibetta.

PRESENT: Messrs. E. M. Breithaupt, Jas. Chisholm, W. Davies, D. A. Donaldson, H. G. Grant, J. S. Gerrard, R. Hamilton, James Hume, A. H. Jackson, Kaundeniya, A. Lambert, F. Macrae, H. M. Mann, H. Robinson, J. Rose, H.T. Shaw, H.G. Parsons, *Honorary Secretary*, and Mr. James Chisholm, *in the Chair*.

Ballot papers for President for 1898-99, were opened, when Mr. W. H. Sprott was found to have been elected by a large majority in place of Mr. Jas. Chisholm, who regretted he was unable to accept office, and explained to the meeting at some length the different reasons and obstacles there were to his becoming President, at the same time he warmly thanked the Members for the honour of having elected him in the first instance.

The Honorary Secretary expressed his regret that the circulars sent out should have been found to be understamped, however, the question was before the Post Office authorities, as he did not admit that the mistake was on their side.

The following gentlemen were unanimously elected Members of the Association:—Messrs. T. W. L. Hext, Jas. Hume, L. C. Bearne, W. H. Wilkinson and A. J. Wright.

Currency Question.—Circulars and letters from Secy., U.P.A.S.I., were read, and after much discussion, it was resolved on the proposition of the Chairman, seconded by Mr. Davies, "that the rupee, if fixed at a rate that would not interfere materially with the Agricultural and producers' interest, would be the most suitable policy for us to support."

The delegates to the U.P.A.S.I. Meeting in August, would be instructed to represent the views of the Association on the above, leaving it to experts to discover the best means of securing a stable currency.

Delegates to U.P.A.S.I.—Resolved that the President and Honorary Secretary do attend, accompanied by Mr. A. Lambert from South Coorg, and Mr. Murray Aynsley from North Coorg.

Coolie Shelters.—Resolved that the Honorary Secretary do write to Government asking for an account of expenditure on coolie shelters, for the information of those who had subscribed.

Pollibetta Hospital.—The Honorary Secretary having read the correspondence it was resolved that the Commissioner of Coorg be asked if in the event of Rs.4,000 being subscribed, Government will make up the estimated balance, at the same time intimating that maintenance charges could not be guaranteed. All present, with hardly an exception, agreed to support and subscribe to the hospital.

Revenue Demand.—Resolved that the Commissioner of Coorg be asked to change the date for payment of land Assessment on Coffee to 1st August of each year, instead of as at present.

Railway.—The Honorary Secretary read letters from the Malabar Chamber of Commerce, Consulting Engineer for Railways, Madras, and others. It was resolved "that this Association do unanimously support the Railway Policy of Madras Government as indicated in G.O., No. 852, Railway, dated 23rd June, 1898."

The Honorary Secretary informed the Meeting that he proposed to bring up the subject at the U.P.A.S.I. Meeting in August.

Improvement of Coffee.—Resolved that this Association do apply for Mr. Cameron's services for a tour in Coorg as settled by the U.P.A.S.I. in August, 1897, and that the delegatee be instructed to arrange accordingly.

Land Record Cess.—Resolved that the Honorary Secretary do ask the Commissioner of Coorg if Government will inform this Association as to the income and expenditure of this department.

With a vote of thanks to the Chair the meeting ended.

H. G. PARSONS,
Honorary Secretary.

SHEVAROYS.

Proceedings of the Monthly Committee Meeting of the Shevaroy Planters' Association held in the Victoria Rooms, Yercaud, on Monday the 5th September, 1898, at 1 P.M.

PRESENT: Messrs. C. Dickins, C. Rahm, Rev. J. M. Kempf, C. G. Lechler, *Chairman*, J. C. Large, T. H. Short, R. Gompertz, *Honorary Secretary*.

1. Notice calling the meeting was taken as read.
2. Copy of Plague Notice and of Collector's No. 43 of 30th ultimo (Plague) to the Deputy Tahsildar of Yercaud was read, and it was resolved with reference thereto that, in the opinion of this Meeting, it is the duty of all Planters to give the Government officials every assistance in their power in the present emergency.
3. *Resolved* that the *Central African Times* (newspaper) be stopped.
4. *Resolved* that Mr. Thurston Short be requested to go through the book of proceedings, noting any alterations or additions that have been made in the rules since the Association was started and submit them to the Committee with a view of framing a new code of rules embodying as far as may be the above alterations.

ROBERT GOMPERTZ,
Honorary Secretary, S.P.A.

HEALTH AND HARD MUSCLES.

IF John Simpson were not a blacksmith we might not have occasion to allude to him at the very outset of this writing. But he *is* a blacksmith and will thus serve an important purpose; that, too, without having to put on his leather apron to do it.

And he will do it by standing in front of his forge for five minutes while we all take a look at him. He is a strong and robust man, as Mr. Dickens's Joe Gargery was—as all blacksmiths ought to be. Ought to be, I say. But *are* they?—as a matter of fact? No, they are not—not by many a length of nail rod.

Now it is somehow a common notion that all men who work hard, especially amid rough surroundings and in the fresh air, are apt to be vigorous, healthy fellows; they are supposed to joke at doctors, to have no use for apothecaries, and even to regard undertakers as the necessity of a distant future. Is this view a true view? Are health and hard muscles always found together? Take your time to think. Meanwhile we will hear what Mr. Simpson himself says:—

"Up to the spring of 1885," he writes in a letter dated May 5th, 1893, "I was strong as most men—perhaps stronger than most. Then I began to suffer from illness. My victuals and I had a falling out. After every meal I had great pain and fulness of the chest. Then I got into such a condition that I had these feelings nearly all the while. I tried to avoid them by eating nothing but light food, but the result was just the same. I think a morsel of bread would have hurt me almost as much as a round of beef. Then I began to lose weight, and had all I could do to keep up with my work. The doctor gave me medicine, but I got no help from it.

"I was wondering how this would end when I heard of Mother Seigel's Curative Syrup and bought a bottle of it from Mr. James Crossley, the grocer at Mile Walk. The effect was speedy. It appeared to go straight to the right spot, and it wasn't long before I was able to eat without any pain to follow. Then my strength and flesh gradually came back, and ever since I have done my work as easily as I did before the disease, whatever it was, overtook me. (Signed) John Simpson, Cliviger, near Burnley."

Now, about that health and hard muscle question that I put to the reader; what's the answer? Why, of course, the answer is what any intelligent man would make who thinks with his eyes open. No; health and hard muscles are not always found together. But let us look sharp and commit no errors. The facts run this way: While a man cannot grow strong without a certain degree of health, it is also true that a notable amount of muscular power is consistent with both organic and functional trouble of the stomach, liver, kidneys, or heart. A man may be able to lift 500 pounds, and drop dead within a minute after he does it.

Sailors, farmers, miners, drivers of trams, 'busses, &c., outdoor labourers of different sorts (especially after reaching mid life) nearly all fall victims to rheumatism, nervous debility, or dyspe Yes, and do hard work for years just the same.

I said "*or*" dyspepsia. Leave out the "or" and say dyspep dyspepsia only—and you have struck bottom. This produce the other maladies; they are merely results and symptoms There's no keeping clear of it by running off to sea, working farm, or diving down into a mine. No matter where you go or you do, indoors or out, clerking in the Bank of England, or dri the locomotive of the Scotch Express—*dyspepsia* will get hold of y you give it a chance. And most men do *that* as if they we eager to be ill as they are to be rich. Which reminds me t you in a subsequent article how to avoid dyspepsia. For time I can only speak of how to cure it. Imitate John Simp example. Do what he did. And remember that stalwart me unconscious) often stand nearer a bed of pain, nearer death, tha the feeble women whom they pity.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (*August 26th*, 1898) sa Good prices were obtained for the moderate supplies brought forwa Public Sale this week and sellers were able to dispose of nearly a coffee catalogued.

Only about 150 bags East India were offered and these realise prices for good bold greyish descriptions.

The Central American kinds met a good demand at fully previous for colory grades whilst common sorts sold steadily.

A further advance occurred in Futures this week. On the cont deficiency in Brazil receipts as compared with last year and quotatio one time showed a rise of 2/3 on the week, but the market closes 6 the best.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Marke the Fortnight ending August 24th, 1898, says:—Bank rate 2½%. Bo Exchange closes at 1s 3 7/32d. Brazil Exchange 7 11/32d. Rupee paper 62¾. Silver 27 13/16d per oz.

The moderate supply offered during the past week has again steady demand, and prices generally are slightly dearer. The proportion of desirable colory sold with good competition at very prices. Brazil markets quiet but steady.

Daily receipts averaged 13,100 bags in Rio, and 29,100 bags in San Futures have been firm, and at the close the market is very st with buyers at an advance of about 2s. per cwt., viz.:—Good av Santos in Havre, September delivery, fcs. 39.25, in Hamburg pf. 32½ No. 7 low ordinary Rio in New York $5.70.

Do. last year ... 264 „ „ ... 725 „ „ ...12,635 „

We take the following from London advices of 26th ult.—The market has again been only moderately supplied, and with a steady demand the bulk has been sold. Ceylon Plantation realised again very satisfactory prices, and the limited quantity of East India found buyers at a distinct advance. Mocha and Jamaica very difficult of sale. Foreign growths of desirable quality have brought fully valuations and occasionally rather more, but the middling and common lots were dull. "Futures" have been strong and advancing, but the closing prices shew a slight reduction from the recent highest; the shortage of receipts, and the reduced estimate for the Brazil crop caused by frost, have been the factors engineering the rise; latest rates are :—

London	...Santos	...December delivery	...	32s. 6d.
New York	...No. 7 Rio	... „ „	...	6.00 cents.
Hamburg	...Santos	... „ „	...	33 pf.

GUATEMALA.—Of 1,363 bags offered about 950 bags sold, ordinary dull pale 37s 6d to 38s 6d, good ordinary palish 46s, low middling gray 57s, middling 67s 6d, good middling 75s 6d, good colory 87s to 87s 6d, fine colory bold 101s 6d to 102s, pea-berry 78s to 88s; London-cleaned, mixed small 32s to 50s, damaged medium 51s, low middling to middling greenish colory 64s to 72s, bold 84s, pea-berry 80s 6d.

COLUMBIAN.—1,141 bags mostly sold—small pale 33s 6d to 39s, fine fine ordinary 55s 6d to 56s, low middling greenish 59s 6d to 61s 6d, bold pale 62s; London-cleaned, mixed to fair smalls 26s to 45s, damaged soft mixed black and red 40s to 52s, low middling soft mixed 57s to 64s 6d, middling to good colory 66s to 80s 6d, good bold 83s to 93s, pea-berry 68s to 78s.

BOLIVIAN.—25 bags damaged London-cleaned sold at 43s.

BRAZIL.—170 bags Rio bought in.

Havre, August 25.—Market fluctuating. Santos good average September opened at 39¾f and closed at 39½f, December opened at 40¼f and closed at 40f.

Hamburg, August 25.—Good average Santos September opened at 33⅝m. and closed at 33½m.

New York, August 24.—Closing prices of No. 7 Rio were as follow :—

	Aug.	Sept.	Oct.	Nov.	Dec.
Aug. 24 ...	5.70	5.70	5.80	5.85	6.00
Aug. 23 ...	5.65	5.65	5.70	5.75	5.90

TEA.

CHINA.—A dull tone has fallen on the market, and transactions of importance are very few. Prices, however, have not materially altered from those lately ruling.

At auctions during the week 4,887 packages have been offered and a small proportion sold as follows :—
half-chests new season's Black leaf Congou, common Moning 4½d.
ditto new Red leaf Congou, Soomoo, 4⅝d, Panyong 5⅜d.
boxes Pakling Congou 5⅞d.
ditto new season's new make Congou 4⅝d to 6d.
half-chests Souchong 5½d.
boxes Canton Scented Orange Pekoe 4¾d to 9d.
ditto Scented Orange Pekoe 8d to 10½d.
half chests and cases Moyune Green: Gunpowder, medium to good medum 6½d to 8¾d, good to fine 9½d to 1s 0½d, finest 1s 4d; Imperial, fair 5d, good 8d; Young Hyson, fair 5½d, medium 6d to 8¼d, good to fine Sow Mee 10½d to 1s 0½d; Hyson common 3⅛d, fair 4⅝d, good and fine Foong Mee 9¾d to 11¼d.
ditto ditto new season's Gunpowder 7¼d, Imperial 5¼d, Hyson 5¾d to 6½d.
boxes Ping Suey Gunpowder 4¼d to 5⅞d.

INDIAN.—Sales comprised 34,300 packages against 33,900 packages last week and 29,400 packages at this time in 1897.

The market kept fairly steady for all except common and medium kinds with unattractive cup, which in most instances passed easier. Parcels with special point and character, particularly Broken Pekoes with "coloury" liquor, commanded good competition and full prices were occasionally paid for them, while choicest lots again brought high figures, notably :—Assams; Sook rating Estate, A.F.T.Co., F.O.P., 2s 6½d, B.O.P., 2s 5½d; Beesakopi Estate, D.D.T.Co., B.O.P., 2s 6½d, B.P., 2s 3½d; Budla Beta Estate, B.B.T.Co., B.O.P., 2s 3½d; Badulipar Estate, B.O.P., 2s 2¾d; Hokungoorie Estate. A.F.T.Co., B.O.P., 2s 2½d; Jamira Estate, J.(A.)T.Co., O.P., 2s 0½d; Samdang Estate, D.D.T.Co., B.O.P., 1s 11½d per lb. Darjeelings: Poobong Estate, B.O.P., 2s 8⅜d, P., 2s 1⅜d; Margaret's Hope Estate, B.P., 2s 5d, O.P., 2s 0½d; Castletan Estate, O.P., 2s 2¼d; Goomtee Estate, B.P., 2s 1⅜d; Moondakotee Estate, A.T.E.Co., B.O.P., 2s 0½d per lb.

Quality of many of the Assams and Darjeelings continues to be satisfactory. Dooars are about on a par with previous arrivals, while Cachars and Sylhets still seem to have been detrimentally affected by the drought. South India was represented by 2,200 packages including some useful invoices from Travancore.

For 25,100 packages on Garden Account 8⅜d per lb. was obtained, contrasted with 9¾d per lb. for 20,300 packages and 9½d per lb. for 24,700 packages in the two former seasons respectively.

CEYLON.—Auctions totalled 29,700 packages *versus* 29,100 packages on the 16th inst., and 27,400 packages a year since.

Buyers showed considerable eagerness to secure the most desirable lines. Common to fair leaf teas went very firmly at previous quotations to a fractional advance. Medium to fine Pekoes, which have been neglected of late, were more in request and in some cases recovered to the extent of ½d to 1d per lb. in value. Broken Pekoes with dark infusions or briskness met with strong support and although selling irregularly, decidedly better rates were given, often culminating in a rise of 1d per lb. when improved flavour was shown. Finest grades for the most part sold dearer.

The average is rather over 7⅜d per lb. On the 18th inst. it stood at about 7¾d per lb. and nearly 7⅜d per lb. in 1897.

JAVA.—No catalogues containing shipments of direct import were issued, but 1,635 packages, more or less affected by the fire at Hay's Wharf in June last, were disposed of "with all faults."

For next week 1,341 packages have been printed.

Deliveries.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :—
From 1st to 23rd Aug., 1898.....11,815,551lbs.
„ „ 1897.....11,739,171 „

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	28,985	5,320	34,305
Ceylon	28,905	819	29,724
Java	—	—	—
Total	57,890	6,139	64,029

PEPPER.

Black.—The market has been dull since our last, and prices have declined. About 150 tons have changed hands, viz. :—

	per lb.
Singapore (basis fair) on the spot	$4\frac{13}{16}$d
do Aug.-Oct. shipment	$4\frac{31}{32}$d
do Sept.-Nov	5d

At public sale on the 24th inst. good supplies were offered, comprising 441 bags Singapore, 290 bags Penang, 414 bags Lampong, 240 bags Aleppy, 97 bags Wynaad, and 8 bags Malabar, but the whole, except the last-named, passed the hammer unsold, the Malabar realising $4\frac{1}{2}$d per lb. for small heavy.

White is also cheaper, with sales of 150 tons, viz. :—

	per lb.
Singapore (basis fair) on the spot	$8\frac{7}{16}$d
do Aug.-Oct. (s.)	$8\frac{5}{8}$d down to $8\frac{3}{8}$d
Penang (basis fair) on the spot	$7\frac{5}{8}$d
do Aug.-Oct. shipment	$7\frac{3}{4}$d
do Oct.-Dec.	$7\frac{3}{4}$d
do Sept.-Nov.	$7\frac{25}{32}$d
do Nov.-Jan.	$7\frac{13}{16}$d
do Dec.-Feb.	$7\frac{7}{8}$d

At auction on Wednesday, of 5 cases 54 bags Singapore offered 5 cases 35 bags sold—fine bright (cases) $10\frac{1}{2}$d, ditto (bags) $9\frac{1}{4}$d to $9\frac{1}{2}$d, good but mixed $8\frac{3}{4}$d. 296 bags Siam were bought in; also 189 bags Penang at $7\frac{5}{8}$d, and 116 bags Palembang at $7\frac{1}{2}$d per lb.

GINGER.

Cochin.—The improved demand noted in our last issue continued for some days and fully 2,000 bags of fair medium and small worked rough changed hands at from 24s to 25s, being a further advance of 2s to 3s per cwt. Under the hammer 143 cases 896 bags were offered and 36 cases 600 bags sold—medium and rather roughly cut and scraped 43s 6d, ditto mouldy 42s 6d; selected bold rough Calicut (in cases) slightly mouldy 44s, ordinary Calicut rough 24s 6d; medium and small some bold washed rough 25s to 26s, small, some shrivelled ditto 23s, small and shrivelled ends, part wormy, 19s 6d to 20s, shrivelled pickings 12s, cuttings, dusty to good, 14s to 15s 6d per cwt.

TEA IN AUSTRALIA.

Australian papers report as follows :—

SYDNEY, August 20th.—A healthy tone continues to pervade the market and buyers are still on the *qui vive* for teas for price, although the quantity of common tea available is small. The third shipment of Foochows, which will be to hand at the close of the week, is expected to bear better results than have been obtained from the earlier arrivals. The tone of the Ceylon market is also such as to lend increased confidence to importers. The Indian market, although noglected, must almost necessarily reflect the improved conditions in other departments.

MELBOURNE, August 23rd.—At the auction sales to-day 110 packages of new season's Indian and 660 packages of Ceylon were offered. The whole of the Indians were cleared at $6\frac{1}{2}$d to $7\frac{3}{4}$d, prices being on a par with valuations. Of the Ceylon 610 packages sold, bidding being very brisk for all common lines. Common pekoe and pekoe souchong brought $5\frac{1}{2}$d to $6\frac{1}{4}$d, fine pekoe to $10\frac{3}{4}$d and finest broken orange pekoe to 1s 4d. Privately, 120 chests of Ceylon sold from 7d. to 9d., 150 quarters of buds at 10d., and 100 half-chests of Panyong at $6\frac{1}{4}$d.

ADELAIDE, August 23rd.—Tea sales are comparatively unimporta both in Ceylon and China.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Repo dated August 19th, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899...	151,278 packages.	281,564 packages.	8,345 packag
1897-1898...	139,122 „	316,705 „	11,457 „

35,361 *pkgs.* INDIAN
29,703 „ CEYLON
296 „ JAVA
} Total 65,360 packages were offered in pub auction this week.

Progress continues to be made in the use of British Grown Tea markets outside the United Kingdom. Figures for the first six mont of the past three years are shown below, viz. :—

1898—24,427,654lb. 1897—22,823,423lb. 1896—17,098,272lb.

The main portion of the shipping trade in Indian Tea is transact during the latter half of the year; therefore the condition of the tra cannot be accurately judged by the small proportion exported during t first six months.

Export of Indian and Ceylon Tea to places outside the United Kingd from 1st January to 30th June.

INDIAN.

	1898.	1897.	1896

Total lb. ...	17,787,535	14,150,950	11,435,3

Indian. The market stood the strain of this week's comparativ large auction fairly well; good liquoring kinds, arrivals of which are n somewhat more plentiful, sold steadily, but for poor Teas competit was less keen and prices somewhat irregular. Monday's auction 30,117 packages was divided between Monday and Wednesday. T official wire from Calcutta gives exports to U. K. for the first half of t month as 11,600,000lb. against 10,800,000lb., and from 1st April 15th August, 36,617,000lb. against 36,790,000lb. for same periods l year. The following averages are worthy of note :—"Amal. T Co., Kale 1/11¾; "Rungmook," 1/8¾; "Jungpannah," 1/8½; "Darjeeling Co." a "Suddia Road T Co.," 1/8; "Tukvar T Co.," 1/7¼.

Ceylon. Competition was good for all grades, prices being fairly fi An improvement in quality took place from many Estates, quotations consequence showing proportionately higher prices, varying from farthing per lb. on some of the lower grades to considerably more up any fine liquoring Pekoes and Broken Pekoes. Private telegraphic adv gives exports to U. K. for first half of month as 3,000,000lb. and estima the quantity for the month as 6,500,000lb. The following averages m be mentioned :—"Haputale Co. Kelliebedde" and "Holmwood," 1/0 "Associated T Co. Silver Kandy" and "S. T. & L. Co. Brookside," 1/-.

Average for the week is 7·63*d.*, against 7½*d.* last year.

Java. Only 296 packages were brought to auction and sold with go spirit at about previous rates. 108 packages Perbawattee averag 10¼d. per lb.

COIMBATORE COFFEE WORKS.

Coffee Cured and Shipped to London on Planters' Account.

ADVANCES MADE ON CROPS ON MODERATE TERMS.

Tools, Roofing and Planters' Stores kept in Stock.

Separate Manure Works have been recently erected, giving greater facilities for the manufacture of Manures. These works are under the immediate supervision of a qualified ***Agricultural Chemist,*** and have a well-equipped ***Laboratory*** in which analyses of ***Soils, Manures, &c.,*** to a limited extent, can be undertaken.

FOR QUOTATIONS AND FURTHER PARTICULARS,

Apply to **T. STANES & CO.,**

Coimbatore and Coonoor.

THE "MADRAS STANDARD,"

Published Twice Daily—Morning and Evening.

THE OLDEST, THE CHEAPEST & THE MOST POPULAR ORGAN IN SOUTHERN INDIA.

Its chief features are:

A LONDON LETTER written weekly by a distinguished Member of Parliament.

Letters from Hyderabad, Mysore (and Bangalore), Travancore, Cochin, and Pudukota contributed by Correspondents well versed in the affairs of those States.

Letters from Far and Near and Telepathic Interviews. } Political Sketches and Caricatures of the leading men in Southern India.

Portrait Gallery—Lives of distinguished men in Southern India with their Portraits. Spicy Jottings on current topics. Amusing Notes, Stories and Sketches. News from various Mofussil Stations. Interesting Extracts.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, ght Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including stage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. r line for the first, 3 as. for the second, and 2 as. for the third and succeeding sertions. Five-line (or shorter) advertisements from Subscribers will be serted for three issues for one rupee; non-Subscribers will be charged two pees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic currence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duff & Co., Proprietors, Planting Opinion," 16/17, Armenian Street, Madras.

IMPORTANT NOTICE.

The Offices of this paper having now been removed to Madras, all remittances should be made payable to E. C. Duff & Co., Proprietors, *Planting Opinion*, 16 and 17, Armenian Street, Madras, who will also attend to all advertisements, &c.

Letters to the Editor should also be addressed to the Madras Office.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 30th September, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Polli Betta, *22nd Sept.—Weather.*—Fine with passing clouds from 15th to 17th. ·05 inch next day, since when there has been rain every afternoon. Rather a smart shower measuring ·70 inch on the 19th. Yesterday the rain seemed to be unmistakably from N.-E., and measured about same, viz., ·70 inch. *Plant-diseases.*—Leaf-diseases bad only in patches. Rather worse Siddapur way. *Crops.*—Will be ready for picking on 15th proximo on places that got early blossom showers. *Interesting Items.*—Meeting of Officers and Non-commissioned Officers yesterday to arrange Autumn Rifle Meeting Programme.

GAINERS BY LOW EXCHANGE.

So much of our space has lately been devoted to statements concerning the Currency question and the Indian Currency Committee that we hesitate to refer to the subject of Exchange again so soon. But, from the planters' standpoint, it is of such vital interest that, perhaps, we shall be more easily forgiven for saying too much than for omitting to give the subject sufficient attention. It has been repeatedly remarked that the Currency question has been threshed out from every point of view. If this were true, a conclusion should be easily arrived at by the able and experienced financiers on the Currency Committee. But it is not the case. The Exchange problem is one of enormous intricacy, it is beset with complications, and these open up fresh complications, and so on—according to the *ad infinitum* principles that cause big fleas to have little fleas to bite them. For instance, we doubt if the questions of profit and loss, and loss and profit, caused by a rise or

a fall in exchange, have yet been thoroughly threshed out. True, the planter has asserted that, broadly speaking, the ryot and he are gainers by a low Exchange; but that is not enough, especially seeing that the planter does not appear to have considered whether there is any low limit, short of zero or "nothingness," beyond which a continued fall would cease to be beneficial, or would become positively harmful, to him. It may seem absurd to inquire from planters:—"If a shilling rupee would be more profitable to you than a one-shilling-and four-penny rupee, would a two-penny rupee be still more profitable?" Nevertheless, we put the question in all seriousness, for it is one that must be answered before Government can be expected to identify itself with a policy that would knock the bottom out of Exchange, and leave it to rest on Silver alone. It is a point that has scarcely received enough attention hitherto, for while it introduces the *argumentum ad absurdum*, it is by no means so absurd a question as it may at first sight appear. If, for example, a happy mean is to be *fixed* by Government action, what is that mean to be: what is the fairest level (or the least unfair) after all the various conflicting interests concerned have been involved? To arrive at even an idea of this, we must have the discussion of high or low Exchange held within limits. Par of Exchange may be regarded as a generally accepted maximum, above which not even a Home-charges-burdened Government wishes to go; but the minimum is by no means so easily ascertained, though perhaps 10*d*. is about the lowest level that has been mentioned in the course of a serious discussion of Exchange.

Then there is another point. Not very long ago, a young planter suggested that measures should be taken to try to bring about a reduction of the British Import Duty on Coffee. An older planter immediately pointed out that the present duty is a *protection* to Indian coffee, which, though of very superior quality, has only to pay the same duty per hundredweight as the very inferior Brazilian coffee and other lower sorts. Consequently, the *percentage* of duty on Indian coffee is less than that on Brazilian. Now, the Government of India has to consider a point of which this little incident has reminded us. It can scarcely be said to be a similar point, yet it is one of the first importance. It is to be found underlying the question, "Who would be the chief gainers by a low exchange?" Probably the answer that will most readily suggest itself to our readers is, "the ryot and the planter." But is that the correct answer? It is not easy to say, so long as certain statistics are not available; but at least we may suggest that the ryot who holds his land under the Government of Madras would be but a *temporary* gainer. He would in all probability obtain higher prices for his crops, because their silver value would most likely be enhanced; but in due course the time for re-assessment would come, and a Government with a depleted exchequer would squeeze additional kist out of him to the uttermost proportion of the increase in his income, if not far in excess thereof. Those who *would* gain permanently, however, would be the zemindars and others who reap the benefit of the permanent settlement, and under whom probably millions of ryots have to work. It would be very interesting if Government were to raise the veil that now covers this mysterious item, and explain exactly what area of land, and approximately what extent of crops and how many among the population of the country, are af by the permanent settlement. We imagine that the f would be a revelation to planters generally, and would that a reduction of Exchange really means a heavy addi bounty to landholders whose interests are protected the permanent settlement, and who have for years past practically receiving an enormous subsidy at the expe the State. In other words, the profit would not fall Government, nor yet to the population generally, of that Government is the representative. It would fa favoured and for the most part wealthy few; and the thus caused in Government budgets could only be m taxation that would fall almost entirely on others than few.

It has been estimated that a 1/4*d*. rupee represen effect a tax of, say, 40 per cent. on exports, whereas to the deficit that would arise if the rupee were put on level, nothing like a tax of 40 per cent. on Exports ha been suggested. Does the explanation of this lie par what has been mentioned above? At any rate, in c records of land-revenue receipts in various parts of we find that the average assessment of different e ranges from something like *one-tenth of a pie* to *rupee* per acre! How can the lower level still force unless the tenure under which the holder has hi renders him entirely free of the increased strain o Government Exchequer that results from low Excha The very low assessments of $\frac{1}{10}$ pie, $\frac{1}{3}$ pie and so on c have been raised by any re-assessment, and in all proba their present ridiculous lowness is partly due to the enh ment of values that has followed a heavy fall in Exch At least, the matter appears to us to need explan There may be some simple explanation of which we nothing, but our present idea is that in advocating lo change planters are urging the adoption of a cours would advance the interests of another class of holders very much more than it could be expect advance their own interests on growers of tea, coffe An export duty, too, would not touch these landho They appear to be a bounty-fed class, and the b increases as the rupee decreases in value. If this comprehensive statistics relating to the permanent s ment would certainly be interesting at the present So also would carefully-made calculations as to the pro effects of a rise or fall in Exchange on other items of re besides land revenue, and on expenditure. It is v assumed, for instance, that low Exchange means produce, increased exports and, therefore, improved ra traffic revenues. But how about the additional inter be paid on moneys borrowed for the construction o railways, and on materials, stores, etc.? It would possible to calculate the Dr. and Cr. items with any approach to accuracy, but a determined attempt on th of some Government official or department, with the sary figures at hand, would at least throw a little needed light on a dark side of the Currency problem suggesting this, we do not speculate as to whether the of a full inquiry would be to lead to a conclusion that 1*s*. 3*d*. or 1*s*. 6*d*., or any other figure, would be the generally acceptable and beneficial level for the rupee. merely point to what appears to us to need a good d investigation and elucidation before a right decision a happy medium rate of Exchange can be arrived at.

COFFEE HYBRIDS.

On another page we give some remarks of the *Madras il* on the subject of hybridisation, and in the U.P.A.S.I. tion it is recorded that Mr. Cameron is to proceed to org during the cold season in order to make certain estigations into the matter. *Apropos* of this, a correndent writes to point out that while a good deal of attenn is being directed to a hybrid between Liberian and abica, there is another cross that demands much more ention, viz., that between Maragogipe and Arabica. In opinion a cross between the latter two will meet with ch more favour "because of the superior flavour of the ragogipe, as it is well known that this variety gets much her prices in the London market than Liberian, Maragipe having fetched as much as £140 per ton in London." r friend adds that the nature of Maragogipe resembles Arabica more closely than the Liberian, and will there- assimilate with it more readily. He remarks that he enormous capsule and small bean of the Liberian fer too much from the Arabica, and a cross produces nething eccentric, whereas the result of the other combiion is a raising of the species." But, unfortunately, he s nothing of the probable disease-resisting properties the hybrid he advocates, and that is, after all, a more portant matter than improvement of flavour. Mr. meron, it will be observed, did not confine his suggesns to Liberian and Arabica: he distinctly advocated care- experiments with different varieties of Coffee, and we ve no doubt that Maragogipe will receive a fair share of attention of those planters who take up cross fertilisan and hybridisation energetically. Maragogipe is said be holding out rich promise on the Annamalais, where plants are said to be both vigorous and large. We uld be glad to receive information as to their condition Coorg, Assam, Travancore and Ceylon, in all of which ces they have, we believe, been tried. It would also be ll perhaps if careful inquiries were made regarding xican Coffee, as leaf-disease appears never to have acked it. Of course, it by no means follows that it would m a useful hybrid with Arabica grown in India; but a al might possibly lead to good results.

NOTES.

Bimetallist still! Mr. Balfour lately presented each of the Whips of the Unionist Party h a silver cigar case and a gold match-box.

a & Tea Companies. The following is on the authority of a retired Ceylon planter:—Talking about Tea Companies, I have been attending two mpany meetings, at which not one of the Directors sitting d visited Ceylon or knew anything at all about tea!"

n Paulo Coffee Estate Company. After debiting the London expenses and the interest on the Company's debentures, the net profit for the ar is £7,057, out of which an interim dividend on the prerred shares had been paid, leaving a balance of £3,057. nt of this sum £2,500 has been placed to reserve, and the mainder it is proposed to carry forward.

Export of China Tea. Up to 28th August, the export of black tea for Russia direct from China was about 2½ million lb. in advance of the same period last year. To America the export of black tea is about the same, but of green tea less than half for same period last year. To Great Britain, a million lb. less black and 300,000 lb. more green tea.

Tea-making in Japan. It is stated that a Japanese has invented a tea-making machine "which takes the newly-plucked leaf and performs all the necessary operations preliminary to packing, rolling, wasting and polishing." According to the *Japan* Mail, with one man and a boy this machine will manufacture 1,666 lb. of tea in 24 hours.

The weighing of Teas in London. The Secretary of the Ceylon Planters' Association lately sent to the local Press the letter, with inclosure, republished on another page. We need scarcely impress upon Tea planters in South India the desirability of studying the London regulations carefully. The letter of the Metropolitan Bonded Warehouses, Ltd., shows how necessary this is.

The Development of North Borneo. In the opinion of Mr. R.B. Martin, M.P., there is a good opening in British North Borneo for the employment of capital for the cultivation of sugar, tobacco, hemp, coffee and tea among other articles. Enquiries are already being made for land on which to grow tea in Borneo, so it is possible that "Ballyhooly" may soon see the land yielding the fragrant herb in abundance.

Coffee in the Seychelles. Mr. Waddell, who is engaged on the construction of roads in the Seychelle Islands, states that considerable success has attended the exports made to grow coffee there. The Arabica species, which was first tried, did not do well, but the Liberian gives fair promise. Planters should have an eye on the Seychelles, with a view to obtaining seeds or plants thence for hybridisation purposes.

Tea Samples Duty Free in the States. The U. S. Treasury has decided "that where tea is put up in packages of not over one ounce in weight, and the fact is established that they are samples for distribution or for use in soliciting orders, and not for sale, duty thereon will not be imposed under the Act of 1898, or examination made under the Act of 1897. Tea imported in packages of over one ounce in weight will be treated as merchandise, and subjected to examination and payment of duty."

Coffee in Pahang. The Report on the State of Pahang for June and July, 1898, issued from the British Residency at Pahang on 31st July, 1898, states that the aspect which the district presents is one of ever-increasing prosperity and activity, in very marked contrast to its condition a very few years ago. Land is being eagerly taken up all along the length of the Trunk Road, and the coffee and other plantations look exceedingly prosperous. There is a considerable permanent settlement of foreign Malays, and the price of land is still rising.

The Paris Exhibition. Ceylon tea-planters are making energetic preparations for the Paris Exhibition of 1900. It is under contemplation to have a buffet attractively set out, where visitors could lounge comfortably, and where good Ceylon tea will be dispensed. Of course, it is remarked, little sample packets of Ceylon tea will also be distributed, but all these details will be arranged hereafter ; and, no doubt, these arrangements will be carried out successfully. Again, we ask, what is India doing, and more especially what is Southern India doing ?

Two Weeds. The wild passion-flower and a kind of sorrel are playing havoc with some estates on the Nilgiris, and both are said to be spreading to an alarming extent. The roots of both penetrate the soil to a great depth, and come up above ground a long distance off. Digging seems to have little effect on the first one, as it appears a short time after as bad as ever. The sorrel grows thick like a carpet. Both are said to have been caused by careless coolies throwing the seeds on the land. Some planters are, however, of the opinion the sorrel was introduced in the poonac. Any information on this subject would be welcome.

A Journalistic "Birthday." The first anniversary of the birth of the infant *Indian Gardening* has been celebrated, and we among others press forward to offer congratulations and good wishes. It is a thriving and healthy babe, and should grow into a strong and prosperous manhood. We have quoted it in our columns on various occasions, and shall no doubt do so often in the future, for its contents gain in interest as its age advances. The world of flowers and shrubs and ferns, etc., in India is large enough to call for a special journal such as the *A.G.*, and there is reason to believe that the paper "meets a felt want."

Fine Tea. Some fine tea sold at Colombo has commanded fine prices. On 14th instant the following rates were paid for a break of tea from the High Forest Estate :—

		lb.	cents.
30 hf. c. Broken Orange Pekoe...	...	1,680	88
23 „ c. Orange Pekoe ...	...	1,104	64
27 „ c. Pekoe ...	...	1,242	53

Average 71 cents.

These prices represent As.14-1, As.10-3, As.8-5, and an average of As.11-4, respectively. Proof such as this, that fine teas will command high rates, should do much to encourage the improvement of quality in preference to mere increase of cultivation.

Bengal United Tea Company. At the first ordinary general meeting held on 1st instant, the Chairman, in moving the adoption of the report, stated that the profits of the season amounted to £2,677, and after debiting this with London expenses and dividend on the preference and ordinary shares paid in May last, there remained a balance of £1,424 to be carried forward. He said the season had been notoriously an unfavourable one, and that was made worse by the fall in prices. Still on the whole, he did not think the accounts were disappointing. The Directors had taken the exchange at 1*s.* 2*d.*, while the present rate was 1*s.* 4*d.* He feared the present season had started under very unfavourable auspices, the great dro having lessened the production and deteriorated the qu while the range of prices was also very low. After discussion, the report was adopted.

The London Market. Telegraphing to the *Time Ceylon* on 15th instant, Messrs. Wilson and Stanton reported a generally steady ma with good liquoring Pekoes in improving demand and P for price dearer. Fair liquoring Ceylon Pekoe Souc was quoted 6½*d.*, and the average of Ceylon tea so garden account during the week 8¼*d.* This is a jump Reuter reports a good demand at fully last prices, and quotes the average at 8¼*d.* (which in his case is an adv of ⅜*d.*) [The *Ceylon Observer* is so excited by this new the way, that it inserts a heading, "Tea 1*s.* up: news." A very different thing from "Tea is up, "Tea 1*d.* up" &c.] Out of 16,000 packages offered fo 15,000 were sold. Of Indian tea, 39,000 packages offered and 35,000 sold. The average was 9¾*d.*, a rise

16*th September*, 1897.

Average price of Tea	...	...	...	7¾*d.*

A New Digestible Tea. A great many proposals have made for rendering tea more di ble than it is commonly supposed to be by people who from dyspepsia. It is believed that the tannin wh present in most teas has an injurious effect upon the of the stomach. Whether this is a fact or not is sca within our province to say, observes the *Grocer*, but is no doubt that the tannin can be extracted, or, sha say, prevented from passing into solution when the made. Up to the present the methods of effecting have chiefly dealt with the tea after the infusion has made, but we have recently heard of a new plan in tea is treated in bulk, so that a grocer may be able t in recommending his tea to his customer, that when th is drunk no ill effects will possibly follow to the dige organs. This process is designed to prevent the ta acid of the tea being dissolved when the hot water is p upon it in the tea-pot. It consists in adding to the dr in bulk a small amount of gelatine or of gum acacia, but albumen will do quite as well. At the same time a quantity of tartrate and carbonate of potash and so

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contai ton :—

61·50	lbs.	Nitrogen.
57·38	„	Potash.
14·92	„	Lime.
13·68	„	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed the parent trees of above analysis at Rs.6 per pound conta about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere from the

MANAGER, ARIENKOW ESTATE,

Shencott

added. This helps the tea to draw, prevents the tannin from dissolving when the tea is made, so that principle which is thought to be so objectionable is eliminated.

A New York "Food Show."

A New York correspondent writes regarding a great food show that was open there last July that it was the best display of its kind ever seen in the United States. He says :—This particular food show has in addition to its permanent features about sixty booths, pavilions, cassetl, cottages, brilliantly decorated in colours, from which proprietary articles are exhibited and their merits demonstrated. The Ceylon and India tea blenders are much in evidence, and from their gaudy booths tea is served to the thousands that crowd every aisle of the great room. Two bands discourse music, and in a large room throngs gather to listen to a cooking lecture. Along one side of the room is a glass-front cold storage room 250 feet in length, in which may be seen every variety of meat, poultry, game, dairy products, fresh fruits, vegetables, and fresh fish. There is a liquor department occupying a very large space ; a counter where coffee is served, also pastry of various sorts and ice cream. The coffee department is an oblong space surrounded by heavy iron or steel bins, beautifully japanned, and each with a capacity for several hundred pounds of coffee. Over this space is a showy canopy or roof in brilliant colours, illuminated by electric lamps. Coffee mills run by electric force or in the enclosure, and are used to grind the coffee as wanted. It is said that 6,000 pounds of roasted coffee are sold every day from this department.

Tea "Politics" in Ceylon.

At a meeting of the "Thirty Committee" held at Kandy on the 10th instant, it was resolved, *inter alia*, (1) That all exporters from Ceylon of Green Teas made in this country be given a grant of cents 10 per lb. on an all-round break. (2) That a reliable person (expert) in Colombo be employed to draw samples from such break, and that the production of his certificate that it is first-class tea, and a copy of the bill of lading being sent to the Secretary, he be authorised to pay over the said grant to such exporter. (3) That the grant above mentioned be in force for nine months, with three months' notice in the event of the "Thirty Committee" desiring to determine the said grant. (4) That the sanction of the Governor in Executive Council be obtained for the appropriation of an amount not exceeding £2,000 sterling to enable the Committee to give effect to the foregoing resolutions. (5) That Messrs. Forbes & Walker be requested to act as experts and to furnish the necessary certificate. This subsidising of a special style of tea is a new departure, and may easily lead the Committee into greater expense than it has estimated. £2,000 looks a large sum, but it remains to be seen whether it will be exceeded at all, or will prove utterly insufficient. If there is a good demand for Green Teas such as Ceylon, our produce planters will no doubt be glad to meet it even without a bounty. Once this subsidy is promised, the inducement to grow in excess of requirements becomes great, and the subsidy may defeat the aim of the donors by a stimulating production as to render a decline in value—to the extent of 10 cents or more—a certainty. On the subject of the appointment of Mr. Kelway Bamber as Agricultural Chemist, the Committee approved the offer made to that gentleman and selected twenty districts as giving a complete representation of Ceylon tea. They recommended that in Duntula, Kelani Valley, and Dikoya (representing over 30,000 acres each), two estates should be selected in each case, and they then resolved "That the Secretary do forward the list of districts above-mentioned to all District Associations, intimating that the estate in each of such districts will be visited by Mr. Kelway Bamber, and inviting the District Associations to appoint a Sub-Committee to select the estate in the district to be so visited, thereafter transmitting the name of the estate so chosen to the Secretary, 'Thirty Committee,' before the 1st October, 1898, from which date Mr. Bamber's engagement begins. If the name of an estate is not sent in to the Secretary by the 1st October, it will be deemed that the selection of an estate is left to the decision of the 'Thirty Committee.'" The remarks of the Committee on the pushing of Ceylon Tea in foreign markets are left over for comment in a future issue.

LETTERS TO THE EDITOR.

LEAF DISEASE.

Sir,—Can you, or any of your readers, kindly give me any advice in the matter of leaf-disease among coffee? Can any cure be effected, or preventative in any way in the case of *young* plants, on the same plantation where older ones are attacked?

James Petley.

P.S.—I would also ask, have you any book you could send me per V.P.P., or can you do me the kindness to refer me to any within your knowledge, and I shall be much obliged.

Toungoo, Burma, } J. P.
6th September, 1898. }

[Note.—We can scarcely do better than refer our correspondent to the Committee Proceedings of the U.P.A.S.I. with reference to Leaf Disease, which appeared in our last issue. We know of no book from which he can obtain more useful practical hints than are there given. The best preventive is to strengthen the plant: select seed carefully and cultivate sufficiently liberally so as to provide the plant with nutritive food.—Ed., *P.O.*]

"CHICK" REDIVIVUS.

Sir,—Since writing to you about the non-bearing of a lower sucker from a Chick coffee tree, I have had the pleasure of seeing a very nice crop on the suckers of undoubtedly chicks not far from this estate. I can't say much for my friend's "powers of observation" after this.

Kadur District, } "D".
4th August, 1898. }

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

[Under the Control of the Secretary, U.P.A.S.I.]

As remarked last week, Coorg's chance of obtaining an Agricultural Chemist is now remote, though the Mysore Government's expert, when he arrives, will no doubt be allowed to render assistance to Coorg planters as well as those in Mysore. Meanwhile, the Mysore Durbar have given a practical proof of their willingness to lend a hand to Coorg. The request was recently made, through the Resident in Mysore, that the services of Mr. Cameron, Superintendent of Public Gardens in Mysore, might be lent for a time in order that he might proceed to Coorg

and conduct certain experiments and make investigations with a view to the improvement of coffee cultivation and the prevention of leaf disease. The Durbar have acceded to this request, and have directed Mr. Cameron to include Coorg in his tour of inspection during the next cold weather and to conduct the investigations suggested by the U.P.A.S.I. Details are to be settled with the Secretary, and no doubt all coffee planters will reap considerable benefit from the result of Mr. Cameron's visit. It is to be made as short as possible, but there will doubtless be time for him to give some useful advice, which will in due course be passed on from Coorg to other districts. The generous action of the Mysore Government deserves a very warm expression of appreciation and thanks.

Alluding to Mr. G. L. Acworth's evidence before the Indian Currency Committee, the *Times of Ceylon* says, Mr. Acworth was not so ready with his figures as was Mr. Christie, and wrongly stated that India had driven China tea out of Australia long ago. It criticises more severely by using as a sub-heading to its remarks the words "An overdrawn picture from his Agent." But it does not point out wherein the exaggeration or error (?) lay.

The Lawrence Asylum Press wishes to publish a revised list of estates and owners in its Almanac for 1899. Individual planters might render assistance by sending the necessary information direct to the Superintendent of the Press. Where possible, "proofs" for revision have been circulated to the Hon. Secretaries of District Planting Associations.

The office of the U.P.A.S.I. has now been removed to 16/17, Armenian Street, Madras.

BRAZIL COFFEE NOTES.

A PHENOMENAL blossoming appeared on the coffee trees throughout a great part of the State of Sâo Paulo during the last half of July. What the result will be, no one seems to know. The blossoms are due in September, but they appear some five or six weeks earlier. It is predicted by many that the blossoms will not adhere, and that they betray weakness in the trees. A project has been presented to the estate legislature of Sâo Paulo, authorizing the State executive to acquire a pavilion at the Paris exposition of 1900 where the agricultural products of Sâo Paulo, principally coffee, can be favourably exhibited. The purpose is to make a propaganda in favour of coffee, and for this purpose coffee will be placed on exhibition in every conceivable way, and cups of the beverage will be distributed to the public. All machinery for preparing coffee for the market, together with machinery and apparatus for roasting, grinding and preparing the beverage, will also be exhibited. It is a practical idea, but why should not the planters bear the expense, instead of the State treasury? Why should a Pindamonhangaba shoemaker pay for a propaganda calculated to benefit the coffee planters alone?—*Rio News*, Aug. 2nd.

IRRIGATED COFFEE ON THE NILGIRIS.

THE Nilgiri correspondent of the *Planter* says:—"I was eye witness to a very interesting experiment being carried out on a small coffee estate growing in a hot district with deficient rainfall and at an elevation of 5,000 feet. At the time of my visit I saw irrigation water being applied intermingled with silt, which the proprietor informed me was found to be very beneficial. His belief was that this silt, although of the subsoil, was rich in mineral matter containing 15 per cent. of potash, and that by the treatment adapted, this large quantity of potash was made available as plant food. The coffee grew under the somewhat heavy shade of the *grevillea robusta*, which was making a perceptible change in trees, as they were throwing out fresh wood and clothing the selves with healthy foliage. The owner admitted having made mistakes with this coffee (which, however, are the universal mista of the district), namely by putting them too close together, *i.e.*, by six, and by stopping them at the usual height of 4½ or 5 f His intention is to let the trees grow up to their natural height to root up alternate rows of trees, so as to give those remain ample food root space."

COFFEE PLANTING IN MEXICO.

(Sir T. J. Lipton's Project.)

Though some Mexican coffee-growers are grumbling at the fit on their produce, it would appear that there is still from 100 to per cent. margin between the cost of growing Mexican coffee and selling price. The complaints are heard because there is no lon 300 or more per cent. profit in raising the berry. Coffee can grown in Mexico for about 8 cents silver per pound. From favou districts transportation to New York costs 50 cents per 100 poun The prevailing prices in New York for Mexican coffee range fr 8 to 16 cents gold per pound, while some fancy grades bring hig prices; therefore, it is readily seen how the profits of 100 and 200 cent. are realised. Coffee has always stood at the head of Mexi agricultural exports, and will probably continue to do so for years come. During the last ten years Mexico has exported coffee to value of nearly 74,000,000 pesos. We learn that Sir Thomas J. Lip meditates a new and important movement in the direction of Mex where he proposes opening up some of the largest coffee plantati in the world, and also large areas for the cultivation of tobacco a cocoa. The plan, which has reached an advanced stage, contempla 10,000 acres in coffee, 10,000 acres in tobacco, and 5,000 acres cocoa.—*H. & C. Mail.*

TEA GARDEN CUSTOMS IN BURMA.

A CONTEMPORARY writes:—A somewhat curious custom prevails most of the tea-growing hill villages, Mr. Leveson says in his report the Northern Shan States. The baskets in which wet tea is packed conveyance on bullocks are of a peculiar shape, somewhat smaller diameter than the ordinary bullock-basket used for rice, but not a deeper. It is generally said that if tea is carried in any other baske the tea goes bad. Possibly the real reason for their use is that, t roads being narrow hill-tracks in which there is often only just ro for a laden bullock to pass, a narrow pack is less knocked about projecting rocks and enclosing hill slopes than a broader load. T baskets being of less capacity below the yoke-poke, packets of tea a carefully fastened with bamboo strips to the top of the basket on eith side of and projecting above the pole. The arrangement of the baskets is a matter of some skill, and can only, it is supposed, performed by the villagers, who charge a fee of eight annas a bullock. This fee is usually paid in coin as an addition to the pa ment in rice for the tea. With this exception, generally speakin only the larger garden-owners in a few of the more importa villages, some of whom also possess pack bullocks, ever see the pr of their tea in coin. In the outlying villages money is scar There are only three bazars in Tawngpeng State, two in the extre south-west, and one in the extreme east of the State, and even them the transactions are barter almost as often as sale. Old t gardens which, when the State had been in a more unsettled con tion, had been neglected, and had consequently lapsed into jung are being re-cleared and elsewhere new trees are being plant The outturn of tea is capable of large development. Both to fos this development, and to reduce the price of rice, which at prese sells at Rs.4 per basket for the greater part of the year, increas facilities for the transport of goods are urgently required, and t principal need of the State is undoubtedly a cart-road communic ing with the Railway.

AUSTRALIANS AS TEA DRINKERS.

THE following is from the Melbourne *Leader*:—

The people of Australasia, as frequently remarked, are well advance of the rest of the human race with regard to their consum tion of tea. The Chinese, however, are omitted from the comparis

as owing to the lack of Celestial Empire statistics, there is no means of ascertaining what position it occupies per capita in the list of the world's tea drinkers. The Australian average consumption per head is a fraction over 7 lb. a year. The United Kingdom comes next in the list with an average of 5¾ lb. The following are the Australian tea statistics for 1897 :—

Colony.		Population.	Tea consumed.
Victoria	...	1,170,000	9,286,286
West Australia	...	157,781	1,414,992
South Australia	...	356,877	2,734,827
New South Wales	...	1,311,440	9,594,198
Queensland	...	480,079	3,074,080
Tasmania	...	167,062	901,670
New Zealand	...	719,292	4,564,840
		4,362,531	31,570,893

The value of the 31,570,893 lb. of tea is given approximately as £975,000. It is interesting to note that the quantities of tea consumed per head in the several colonies exhibit considerable variations. West Australia, with a consumption of about 9½ lb., is an easy first. Next comes Victoria with 8¾ lb., whilst the other colonies, in order, are South Australia, 8 lb.; New South Wales, 7½ lb.; Queensland, 6¾lb.; New Zealand, 6½lb.; and Tasmania, 6 lb. As coffee drinkers the Australians stand on a much lower scale, their average per capita consumption being about ½ lb. per annum.

HINTS ON THE WEIGHING OF TEAS IN LONDON.

MR. A. PHILIP, Secretary to the Planters' Association of Ceylon, has forwarded the following letter and inclosure to the Press :—

THE METROPOLITAN BONDED WAREHOUSES, LIMITED,
9, JOHN STREET, CRUTCHED FRIARS, LONDON,
9th August, 1898.

DEAR SIR,—We invite your attention to the enclosed paper, copies of which we are mailing you under separate cover, which we put forth as containing, in our opinion, instructions in weighing on the Ceylon Gardens, which, if carried out, would show the minimum loss in conformity with the English Custom House Bonded Regulations.

However carefully we, or others, may carry out the weighing—in the face of these Regulations—there may frequently be a larger loss shown than is necessary, unless the planter understands the same, and makes his weights accordingly. Of course, it will be for him to decide as to whether *le jeu vaut la chandelle*, that will depend upon the value of his tea no doubt. It is evident that the Warehouse Keeper can in no way guarantee weights; we can only deal with the packages as they reach us, and very often indeed have to record a quite unnecessary "shortage" upon invoice weights, owing to the want of a system on the gardens.

Of course, Superintendents can ascertain from their Colombo Agents whether their teas are generally re-bulked in London or not. We must add that our reason for thus coming before you, and our only interest in the matter, is the hope of being of some service to our planting friends in Ceylon, and we would ask you kindly to distribute the circular among the members of your Association at your next General Meeting, and we shall be glad to have the consensus of opinion upon the subject.—We are, dear Sir, yours faithfully, The Metropolitan Bonded Warehouses, Ltd.,

(Signed) LESLIE MARGETT,
Secretary.

A LABORATORY FARM.

MR. JOHN MILLS supplies the *Humanitarian* for August with a highly instructive account of the laboratory farm founded and endowed by Sir John Laws, under the heading "Scientific Agriculture at Rothamsted," near St. Albans. For more than fifty years careful experiments in agriculture and argicultural chemistry have been carried on there.

The rainfall is carefully studied. Results prove that the "fertilising rain" is an incorrect phrase, for the rain washes out the nitrogen which is the fertilising element from the soil! Nitrogen is the principal element, it appears, in the fertility of land. Arable land treated only with mineral manures without nitrogen becomes impoverished. Conversion to permanent grass is needed to restore the nitrogen, which is, however, also restored by its fixation from the atmosphere by growing leguminous crops. Even when nitrogen is present in manures, the plant cannot assimilate it except the soil be "infected" with the power to do so; and this power is supposed to be the work of bacteria. These bacteria flourish in the roots of leguminous plants, and once present enable the plants to take up nitrogen freely from the air. Hales, two hundred years ago, found that a plant growing in a pot of soil increased in weight out of all proportion to the very slight diminution in weight of the soil. The Rothamsted chemists have shown that 95 per cent. of the weight of the plant comes from the air, not the soil.

Experiments with and without manures have yielded the following results, which Mr. Mill put in this tabular form :—

Averages.			14 Tons Farmyard Manure every year.	Without Manure every year.	Mixed Mineral Manure alone.	Ammonium Salts alone.
			Bushels.	Bushels.	Bushels.	Bushels.
8	years,	1852-59 ...	34⅜	16⅛	19	32⅜
8	,,	1860-67 ...	35¾	13½	15¼	31¼
8	,,	1868-75 ...	35⅜	12¼	14	28½
8	,,	1876-83 ...	28⅝	10½	12⅝	27¾
8	,,	1884-91 ...	39¼	12¾	13¾	32½
20	,,	1852-71 ...	35⅞	14½	17	31⅝
20	,,	1872-91 ...	33½	11½	12⅞	29½
40	,,	1852-91 ...	34⅞	13	15	30½
50	,,	1844-93 ...	33½	13½	...	...

The average without manure for fifty years is above the average of the United States, and about the average for the whole world.

COFFEE IMPORTS INTO THE UNITED STATES.

THE following figures are given in the report of the U. S. Bureau of Statistics to show the total net imports of coffee during the last six years :—

Year ending June 30—			Pounds.	Value.
1898	...	...	851,691,346	$62,674,241
1897	...	...	724,559,536	79,893,943
1896	...	...	572,671,840	83,534,366
1895	...	...	643,234,766	94,599,880
1894	...	...	547,068,994	89,600,572
1893	...	...	551,395,250	78,444,496
	Total	...	3,890,621,732	$488,747,498
Average per year		...	648,436,955	$81,457,916

The following table shows the average import price for the past six years :—

Year	Price per lb.—cts.	Year	Price per lb.—cts.
1898	... 7·3	1895	... 14·7
1897	... 11·0	1894	... 16·4
1896	... 14·6	1893	... 14·0

The coffee imported was received from the following countries :—

United Kingdom	...	1,796,985
France	...	859,419
Germany	...	7,314,801
Netherlands	...	2,409,967
Other Europe	...	2,427,834
Central America	...	35,862,385
Mexico	...	34,511,168
West Indies	...	6,412,209
Brazil	...	661,008,372
Other South America	...	90,113,241
East Indies	...	21,311,159
Other Asia and Oceanica	...	3,947,018
Africa	...	42,305
Other countries	...	1,477,352
Total	...	870,514,215

LOOK ON THIS PICTURE.

We take the following from the remarks of a planter in a recent issue of the *Ceylon Observer* :—

What a grand coffee year this would have been had we been growing it as in by-gone days. These long spells of dry weather would have ripened the wood for the big blossom in September on the Uva side. Should this weather continue, the cardamom crop will be very short this year, and some of us trust to the cardamoms paying for the loss on the tea.

AND ON TIHS!

THE following comes from the *Times of Ceylon* :—

THE LAST COFFEE ESTATE IN CEYLON.

ROEHAMPTON JOINS THE GREAT MAJORITY.

Haputale and Badulla are the only two important districts in which coffee is still cultivated, but even there the older cultivation has in every place given way to tea. That is to say, all estates have planted up certain portions with the newer product. Spring Valley Badulla, one of the crack coffee places until quite recently, is now a fine sheet of tea; and, in Haputale, Niabedde, Gonamotava and Craig have all gone in for tea as well as coffee. But Roehampton has never yet gone in for it. The estate, which once belonged to Geo. Hudson, has stuck to its coffee and has obtained good crops—indeed, the coffee below the road—and above it too (how well the writer remembers it being felled and burnt off!) promises to have a good crop this year. But the estate has not a tea bush on it, and to-day, we believe, it is the only good old coffee estate in the island of which this can be said. But all is to be altered. A part of the estate through which the railway goes is to be planted up, we hear, in tea this next North-East Monsoon, and we suppose that this is but the beginning of the end. However, there is still a good deal of fine coffee on the estate, and with careful cultivation, it will still yield paying crops.

AND AGAIN ON THIS!

A CORRESPONDENT writes to the *Times of Ceylon* anent the drought in Uva and its effect on Tea and Coffee :—

The drought we have been having for the past few months is still continuing, and vegetation is suffering as a consequence. Tea is flushing very poorly, and the output from this side, I fear, for the year will be much below estimates. The season so far, however, has been capital for coffee. The trees are full of crop, and another fine blossom has set in. The present appearance of coffee makes one think of the old days when coffee was "king."

COFFEE IN MEXICO.

WRITING to the *Ceylon Observer,* Mr. E. O. Darley makes the following remarks about the cultivation of coffee in Mexico :—

Messrs. Clarke and Fort, whom you quote as saying coffee did not pay in Mexico, on account of present low prices, can hardly have looked very closely into the matter—in fact I heard that they were never off the railroad and only saw the poorest part of Mexico, and the one coffee district of Cardoba, the oldest certainly, but having the thinnest soil and smallest crops, though the dearest land because being easy of access to Mexico city and Vera Cruz. On the Isthmus of Tekuantepee, in Oaxa and in Chiapas, as fertile land as any in the world, suitable for every tropical product, can be bought in small blocks of 200 to 1,000 acres, with good transport facilities, for from $15 to $25 silver per acre, large tracts at a much cheaper price, and I will guarantee to plant coffee and bring to bearing for $120 (one hundred and twenty dollars) per acre. Coffee can be produced for from $5 to $8 per 100 lb., the former dried in cherry and peeled, the latter pulped, washed, peeled and classified ready for market. The former is quoted to-day at $20 per 100 lb., and the latter in New York at $30 and $32; and as coffee bears here some crop at two years old and one lb per tree at three years old and at least two lb. per tree at five years old, with 1,000 trees per acre, there is still a very handsome profit even at the present low prices. He observes in a P.S. that the Mexican dollar is worth about 2 shill £1 exchanging for $10.50 at present rate. Mexican coffee properly cured will always bring a good price in New Yor mixing with the inferior South American, so much used i United States, to give it a flavour. Since Messrs. Clarke and were in Mexico, eight American Companies have bought 25 acres of coffee land on the Isthmus alone, which does not look the Americans feared for the future of Mexican coffee. soil here is so rich that crops have to be seen to be belie and coffee if grown under *high moderate shade* only needs pru once and weeding four times a year; if grown without sh the crops are heavier, but the growth of weeds is tremen and the extra cost of weeding counterbalances the extra When I came to this district some three years ago, my neighb who has gone in for sugarcane, had near his house about 25 c trees that had been planted by the Indians at least 20 y ago. They had never had any attention at all and he was a to cut them down as they were unsightly, having three or stems and a mass of old wood. They yielded that year three lb an average of clean coffee. I asked to be allowed to prune a fe them to demonstrate what pruning would do. I pruned four of t and was informed by four embyro American coffee planters they certainly would give no crop next season. The next crop carefully gathered from three of them (the fourth was so hea laden with crop that two-thirds of it broke down), dried and clea and they averaged 13½ lb. per tree. Last year Mexico produ 14,817,662 kilos coffee, value $9,876,532. *I have seen no leaf-dis or heard af any.*

INDIA'S EXPORTS OF TEA.

THE Report on the Administration of the Customs Departm for the year 1897-98 shows that the exports of tea increase nearly two million pounds or 1·3 per cent. owing to larger shipm to all the exporting countries. The excess of production demand, the rise in exchange, and the fact that the teas generally deficient in good liquoring quality, lowered the ave price of the article, which stood at 8 annas and 5 pies per lb. in year against 8 annas and 8 pies in 1896-97. Ceylon tea continue gain favour, and the quantity exported during the year incre by 3·9 per cent. The Collector of Customs observes :—"In v of the active competition of Ceylon teas, the Indian planters h taken advantage of the warning note sounded, and are endeavouring to manufacture a better liquoring quality of tea, are not trusting entirely to quantity for their profit, experience hav shown that most of the lower grades do not repay the cost of duction and manufacture."

A propos of the above, we quote some of *Capital's* remarks the report of the Directors of the Nedeem Tea Company, Limi wherein it was stated that the crop of the Company's garden expected to be landed in Calcutta at a cost of As.4-11 per lb. contemporary comments on "the fact that one of the most flourish tea companies in existence, making an enormous crop, and t able to do things cheaply, cannot land its teas in Calcutta un five annas per lb.," remarking :—"What does this mean? We not for a moment imagine that the gross proceeds will work o six-anna average at the end of the year in these days of depre prices; so how the expenses are to be covered is more than any can see, as even at a six-annas average there is only one anna to pay Brokers' commission, Directors' fees, Agency charges, all the odds and ends that invariably crop up in an unexpe manner.

Now, if a company like the Nedeem cannot do more than m two ends meet—and it certainly looks as if more could not be d —what is to become of the hundred and one other concerns that fairly good times can do little better than cover expenses? Her a problem for anyone to work out; the only thing is for some to try and find a way out of this thorny wood. Many suggesti have been made, but none seem to have borne fruit. Planters th selves might effect a very considerable saving, and at the same t improve the *morale* of the coolie mind. For depend upon it, as s as the much-pitied cooly found out his occupation of running a

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

m one garden to another, and always getting well paid for doing was gone, he would soon settle down into a respectable work-n; and the effect on the rest of the garden force would be nderful.

There might, too, be a very considerable reduction in the item of e chowkidars, etc., most useless but expensive appendages to a rden. The want of unanimity in the districts of Cachar and lhet is notorious; and it has been fostered, we are sorry to say, by e agents in Calcutta not combining and discountenancing such actices as the grabbing of imported labour—not time expired en—by one garden from another. What has been the result of this grab—to put a mild term on it? Have the gardens doing it ored? To this we reply, "for a time only;" and the only real iner is the cooly who, by his listening to the blarney of crimps, s managed to raise his pay 25 per cent. In Assam, we are glad say, such practices do not obtain, and would not be tolerated; but ere is a King in Israel there, whilst in Sylhet and Cachar they all e or would like to be Kings in Israel.

THE RUSSIAN MARKET FOR TEA.

Mr. F. H. Skrine has been writing in the *Pall Mall Gazette* the subject of Russia as a field for British enterprise. A ry interesting portion is that which relates to Tea. Mr. krine says :—

The supply of tea to Southern and Asiatic Russia opens up another sta of possibilities to our Indian and Ceylon planters, afflicted as ey are with the consequences of over-production. As every one ows, the samovar and its satellite, the teapot, are ubiquitous roughout the empire, and a weak infusion of their product served in tumblers where all other creature comforts fail. The ussians import more than ninety million pounds of tea annually in ite of a customs duty of 1*s.* 9*d.* per pound. The great bulk is still rnished by China, whence it is imported at very low freights by e vessels of the Volunteer Fleet, despatched to the Far East with oops convicts, railway material, and munitions of war. Of late ars Ceylon, the most progressive of our Eastern dominions, has ntrived to secure a share in this vast supply. Last year she ported about two million pounds of tea to Russia, rather more an twice the quantity sent there in 1896. Ceylon tea, however, is arly all consumed in Central Asia, where it is conveyed by the anscaspian Railway; for Indian and Ceylon planters are still norant of local conditions which have been long since grasped by e wily Chinaman. The Russian consumer eschews tea manufac-red by the processes in use on English plantations. In his eyes achinery for rolling the leaf and artificial heat applied to wither it e abominations. A great Moscow merchant remarked lately that e difference between hand-made and sun-dried tea and that result-g from rolling and withering machines is the difference between waltz played by Strauss's orchestra and the same tune mangled a barrel-organ! Nor is this all. To suit the Russian taste, the aves, when plucked, are allowed to stand in heaps and are mois-ned till the process of fermentation sets in, which gives a peculiar t not disagreeable flavour, and deprives the cheering drink of me of its noxious qualities. When our planters have grasped this ct, then, and not till then, will they find a market for their wares Holy Russia.

The crushing duty levied on imported tea has given an impetus to e attempts to grow the precious herb in Russian territory. The il, climate, and rainfall of the western slopes of the Caucasus are minently suited to the culture. So familiar seem the landscape that its before the Anglo-Indian traveller's eyes on the railway journey om Batoum to Kutais that he marvels at the absence of those glori-ed cabbage gardens that dot the Himalayan slopes. Labour, indeed, costly owing to the thinness of population, and field hands demand *s. 6d.* per diem. It could, however, be imported at a much lower gure, and the difficulty in this respect is mere child's play compared ith that successfully grappled with in Assam. The question has, ndeed, passed beyond the experimental stage, for the Chakva alley, seven miles north of Batoum, encloses tea gardens extending ver five hundred acres. The pioneer was a retired Engineer fficer named Solovitzoff, who so far back as 1885 planted 100 acres ith China seed. Seven years later the Russian Lipton, M. Popoff, f Moscow, followed suit, and his jealously-guarded plantations ver 250 acres. The imperial domains include 150 more, which till lately were directed by an Englishman. In spite of mistakes inseparable from new ventures and the huge salaries lavished on Chinese operatives, M. Popoff's gardens have proved a commercial success, and he was able last year to present a sample of drinkable Russian tea to the Imperial family.

WORKING OF INDIAN TEA COMPANIES.

The annual and carefully-prepared sheet just published by Mr. George Seton, giving the results of the workings of forty-five Indian tea companies for the season 1897, discloses some remarkable changes in comparison with the previous year. Most conspicuous of all that relates to these tea companies in India for the last twelve months under review is their rapid growth and development in that time. Measured by their acreage, they owned 173,074 acres in 1897 as contrasted with 102,397 acres in the former year. These yielded an aggregate crop of 65,726,558lb. (sale weight) in lieu of 50,180,580lb. in 1896 : and the total paid-up capital for the last year reached 7,215,498*l.*, as compared with only 4,725,286*l.* in the previous season. We may here explain that the 1896 figures used for the purpose of comparison are reproduced from our summary in 1897 about this date, as they are for convenience sake omitted from Mr. Seton's statement this year. The general position of the tea companies is better understood aud appreciated when the separate amounts, as representing the main particulars of the last year's workings, are placed side by side with those pertaining to the 1896 season. This view of the case is further strengthened by the fact that, whilst the ratio of expenses to receipts in 1896 was put at 77 per cent., in the past year it rose to 82 per cent.; and instead of the average rate of dividend amounting to $7\frac{3}{4}$ per cent. as in the preceding year, for the whole of 1897 it did not rise above $5\frac{7}{8}$ per cent.

An interesting, if not an entirely new feature to observe in these Indian tea companies, is the formation of fresh combinations, such as the Consolidated Tea and Lands Company (if we interpret Mr. Seton's abbreviations aright), and the Amalgamated Estates, the first-named of which is the most gigantic of all. It claims a cultivated area of 33,332 acres, of which two-thirds are covered with "mature" plants; whereas the next nearest to it in size do not possess more than from about 8,000 acres to 13,000 acres of tea-plants of all sorts. The capital of the Consol. Tea and Lds., as this company is described, is returned as 1,520,000*l.* sterling; and the crop raised under its auspices equalled 11,578,501lb. (as per A/sale weight). After receipts of 367,070*l.*, or 7·62 pence per lb., for the tea sold, and when 284,272*l.*, or 5·90 pence, had been allowed for expenses, there was a net profit left of 82,000*l.*, or 1·72 pence per lb., which it seems was enough to pay a dividend of 10 per cent. on the year's working; leaving a reserve (and balance forward) of 91,905*l.*, or 6·05 per cent. on capital. A few companies, however, with less capital, narrower areas, and of course much more moderate crops and sales, have done better as regards the making of profits. Among these may be mentioned the Assam, Brahmapootra, Jorehaut, Dooars, Doom Dooma, Lebong, Amalgamated Estates, Balijan, Noran, and Rajmai tea companies which have managed to earn dividends of from 10 per cent. to $17\frac{1}{2}$ per cent. But, satisfactory as this may appear, there were instances in 1896 where some of these very companies paid dividends of 15 per cent. to 20 per cent. on their outlay.

There were besides several minor tea companies whose rates of dividend were even worse than the foregoing, and comparatively few which succeeded in paying as much as 8 per cent. or 9 per cent. The latter was the amount credited to the Empire of India Company, while the Chubwa, Jhanzie, Jokai, and Lankapara proprietors had to be content with the smaller figure. Following closely on these tea producers were the British Assam, Meenglas, Attaree Khat, British Indian, Chandpore, Chargola, Darjeeling, Doloo, Scottish Assam, and Tingri companies with their 5 per cent. to 6 per cent. rates of payment; and other less fortunate bodies of tea-planters could only return to their shareholders dividends of 3 per cent. to 4 per cent. Some again earned merely 1 per cent. to 2 per cent. to satisfy their claimants, and certain companies, seven in all (whose names for obvious reasons we forbear to mention), had nothing to disburse to their confiding patrons, and so caused business for the 1897 season to be, on the whole, of an unsatisfactory nature. All this, however, was too well known beforehand to occasion any surprise amongst those acquainted with the secret movements of the tea trade at home; and there can be no doubt that the combined ill-effects of last year's famine, the frontier disturbances, and damage done to crops and out-buildings by earthquakes in our Indian provinces, told seriously upon

the industrial pursuits and conditions of life of the native populations. Bearing these cross circumstances in mind it is no wonder that, though an enormous tea crop was raised, its quality generally was of a poorer class, which consequently failed to yield a higher price with which to defray the heavier expenses of cultivation and contribute towards more handsome dividends.—*Grocer.*

THE LONDON CUSTOMS SYSTEM OF WEIGHING CEYLON TEAS.

INSTRUCTIONS SHOWING HOW TO REDUCE THE LOSS TO A MINIMUM.

In order to avoid the loss usually experienced in Ceylon from the system of weighing in vogue by the London Customs authorities, viz., to give the turn of the scale against the importer, both on gross and tare, the following hints will prove of value to Proprietors and Superintendents of estates:—

1. The tare (that is the weight of the empty package, complete with lid, lead, hoop-iron and nails) should in all cases weigh two to four ounces under the pound, whether the package be chest, half-chest, or box.

2. The gross weight of a package must in all cases weigh three ounces over the pound, whether the package be chest, half-chest or box.

3. When a shipment of teais not to be "Rebulked" in London, the Customs authorities "average tare" the break, that is to say a small percentage of the packages are opened, and their tares ascertained, and from these an "average tare" for the whole break is struck. In this case it is imperative that the tare of each package weighs alike.

4. When a shipment of tea has to be "Rebulked" in London, the tare of each package in the break may vary, *provided* the tare of each package is 2 oz. under the lb.

Subjoined is an example of the correct method of weighing two packages said to contain 100 lb. tea each, which have to be rebulked in London:—

	Garden Weights, Ceylon.	
Tare.	Tea Nett.	Gross Weight.
No. 1. 27 lb. 14 oz.	100 lb. 5 oz.	128 lb. 3 oz.
„ 2. 28 „ 12 „	100 „ 7 „	129 „ 3 „

	Customs Weights, London		
Tare.	Gross Weight.	Tare.	Tea Nett.
No. 1. 27 lb. 14 oz.	128 lb.	28 lb.	100 lb.
„ 2. 28 „ 12 „	129 „	29 „	100 „

The two samples above will demonstrate the point, inasmuch as in No. 1 the loss is 5 oz. only, which is the least possible, while No. 2 shows a loss of 7 oz., owing to the slightly lighter tare.

5. The following is a very usual but incorrect way of weighing teas, possibly through faulty scales or weights:—

	Garden Weights, Ceylon.	
Tare.	Tea Nett.	Gross Weight.
No. 1. 27 lb. 3 oz.	99 lb. 12 oz.	126 lb. 15 oz.
„ 2. 28 „ 1 „	100 „ 13 „	128 „ 14 „

	Customs Weights, London.		
Tare.	Gross Weight.	Tare.	Tea Nett.
No. 1. 27 lb. 3 oz.	126 lb.	28 lb.	98 lb.
„ 2. 28 „ 1 „	128 „	29 „	99 „

The Customs do not recognize ounces. With regard to Example 1, this package, the gross weight of which the Superintendent makes 126 lb. 15 oz., would only be called 126 lb. in London, the tare, according to the Superintendent, is 27 lb. 3 oz., over here the 3 oz. would be called 1 lb., and the tare is called 28 lb. The 28 lb. tare is deducted from the gross weight of 126 lb., with the result that the amount of tea in this package is said to be 98 lb., the owner of the estate losing the 1 lb. 12 oz. tea, which may quite possibly be in the package.

A still larger loss is to be seen in Example 2, in which the Superintendent has packed 100 lb. 13 oz. of tea, but only gets paid for 99 lb., the difference going into the pocket of the retailer.

6. A most important point is to have the weights of the weighing machine, used on the estate, constantly checked, and for this purpose a set of test weights should be kept. A beam scale is to be preferred to a platform one, as the former is the more accurate.

7. When a Superintendent, to equalize the tares of his pack adds pieces of lead or wood for that purpose, the material so should be fixed inside the package, so as to prevent it fallin when the package is opened in London.

8. A Superintendent may "tare" and pack his teas wit greatest care, but if he afterwards permits his carpenter to away from the top of the package before nailing down, all his c work will be wasted.

THE METROPOLITAN BONDED WAREHOUSES, LD.,
CRUTCHED FRIARS, LONDON, *June*, 1898.

COFFEE IN SAO PAULO.

THE rapid extension of coffee-growing in this productive pro of Brazil is attributed by Joquim Franco Lacerda, a merchant district, to the opening up of vast and hitherto, from a market of view, inaccessible tracts, by the great extensions of the Pau Mogyana, Rio Clarense, Sorocabana, and Ituana railway lines first of which has just declared a dividend of 20 per cent.), an inflow of a great current of immigration during the last de calculated at 1,000,000 souls, foreign and native. Besides enormous southern European immigration, many agriculturists come in since 1870 from Rio de Janeiro and Minas Geraes northern provinces, bringing labourers and establishing conside new centres of production.

PRODUCTIVE AGE OF COFFEE TREES.

The production of coffee, as well as the life of the tree, in the of Sao Paulo, depends on the quality of the land and the p There are said to be coffee trees producing to-day at the a seventy-five years. A gentleman resident in Santos states that trees yield 100 arrobas (3,238 pounds), or twenty-five bags, whi the province of Rio de Janeiro the yield is half that amount. proper coffee soil is the terra roxa (red earth), which is red about four feet deep, with a gravel subsoil. The method follow planting has much to do with the product, and in no country i world, particularly since the abolition of slave labour in 188 the substitution therefore of properly-fed and cared-for colonis more care paid to production. The plow as well as the hoe is used and also machinery for all purposes save the plucking o berry from the tree.

Sao Paulo is a State of large plantations. The absence of a tax, and the cost of 10 per cent. on land sales, have retarde democratization of the soil. That coffee is still profitable, not standing prevailing low prices and the unprecedented depreci in exchange (the milreis being quoted at about 7*d.*, or 14 against 27*d.*, or 54 cents, par value), is shown by the fact that o the leading firms in Santos has orders from European clien purchase all plantations offered. It is said that planting would be lucrative to the planter in case coffee should fall to six mi (84 cents) per ten kilograms 22·046 pounds). It is now quot nine milreis ($1·26).

It may be assumed that one-third of the coffee trees of the St Sao Paulo are planted in lands of the first quality, one-third in t second quality, and the remainder in land that may be classed third quality. Lands of the first quality produce even up to years, and in some cases beyond, as before stated; lands o second quality produce up to thirty and thirty-five years, and of the third quality up to fifteen and twenty years. All these are virgin soil, never manured, except by decaying matter gro side by side with the coffee tree or in the interstices of the ro trees, the rotation being here, as Professor Derby of the Geolo Survey has said, not, as in Europe and North America, with u crops, but with jungle. The common coffee plant has more dur than the plant called "bourbon." In general, bourbon c produces at an earlier period than ordinary, and the yields are abundant during the first fifteen years, from which time onwar trees suffer much, and production is gradually reduced. This va in lands of the second and third qualities breaks up quicker the common coffee plant.

OUTLOOK FOR COFFEE PRODUCTION.

Mr. Lacerda thinks that the low price of coffee—nine milrei ten kilograms, or 54 milreis per bag of 132 pounds, equal to United States gold per bag, or 5·7 cents per pound—during th year will cause a cessation of planting new trees. There is re to doubt this, because in the favoured coffee districts of Ri

Preto, etc., planting is constantly going on and on a large scale although low prices and low exchange are, of course, deterrents. The whole matter of prices lies in the question whether or not there is an excess of coffee production in the world. It seems that the production of the world has outrun its consumption, and, unless new markets are opened and its use in old ones extended by propaganda, as has been attempted in Russia, and by the abolition of the heavy import dues that burden it in most European States where it finds acceptance, thus making more easy its extended use, the price will decline still further and stay down.

The case appears to be similar to the question of wheat prices. There are vast quantities of land in various parts of the world where both staples may be grown; no particular aptitude is required in the labourers who produce either; the existence of steamship lines plying to every corner of the earth, equalizing freight rates and bringing the remotest sections within easy distance of central distributing markets; the ramification of railways through the producing countries, the cheapening in rates of money, the diminution of returns expected on capital invested, and the use of machinery and intelligent labour in place of the hand labour of slaves—all tender cost of production and of reaching a market much less than was dreamed of a few years ago. Yet Mr. Lacerda contends that coffee should and may be expected to sell again at £4 ($19·47) per bag, instead of £1-10*s* ($7·30) as at present; and there is a feeling in Santos that all people who do not so think are in some way inimical to the industry.—*American Grocer.*

PLANTING IN THE WEST INDIES.

State Aid.

The new agricultural department to be established in the West Indies will do what it can to improve the cultivation of the cane when only cane can be profitably grown, and to promote the development of a hundred other resources which undoubtedly exist, but for one reason and another have hitherto been largely neglected. To do this the House of Commons has voted a grant of £17,000 a year, which Dr. Morris, of Kew, will administer; and a further £10,000 a year to subsidise a special line of steamers for trading amongst the islands. The new scheme, then, is the direct outcome of the Commisssion which Mr. Chamberlain sent out to investigate the condition of our oldest colonies, and the man who is appointed to work it out sails in a few weeks to begin his arduous duties. Dr. Morris was recently interviewed by a representative of the *Daily News*, and he expressed every confidence in the results which will follow in a few years' time. It is not to bolster up the sugar, but the developement of industries which the infinite prodigality of Nature has made possible, that is the main object of the mission. In the first place, Dr. Morris will establish his headquarters at Barbadoes. From this convenient base he will be able to journey from one island to the other with the least delay, forming as they do a chain, the component parts of which are divided by intervals of sea varying from twenty to 100 miles across. The duties which the department will set itself to perform will be as follows:—1. To supervise and extend the work of the present botanic stations 2. To start industrial schools for training boys in agricultural pursuits. 3. To encourage the theoretical (and to some slight extent the practical) teaching of agriculture in elementry schools. 4. To promote the teaching of scientific agriculture in colleges and schools. 5. To organise horticultural shows and exhibitions of implements and machinery suitable for cultivating and curing tropical products. 6. To prepare bulletins, leaflets, and other literature on subjects suitable for cultivation in the West Indies. Botanic stations are already in existence on a good many islands. It is proposed to extend the work which they are at present doing. They are to devote themselves in a systematic manner to the work of introducing, propagating, and distributing all the promising economic plants of the tropics; they are to initiate the experimental cultivation of new or little known plants, and assist in the efforts made in the larger colonies to secure improved varieties of the sugar cane. They are to act as centres for diffusing accurate information, and as training institutions for the practical teaching of tropical agriculture; also as the headquarters from which agricultural instructors could be sent to give lectures and demonstrations bearing upon the selection of land for tropical economic plants, their suitable cultivation and the best methods for curing and packing the produce.

Blacks as well as whites are to participate in the benefits which may arise from the work of the new department. It will be the business of Dr. Morris's instructors to help them to help themselves. They will be taught how to get the most out of their patches of ground; they will be told what produce it is best fitted for; seeds and plants will be given or sold to them. This will all be a slow business, and Dr. Morris says plainly that the experiment must take ten years before we shall see its full result. Dr. Morris gave some figures showing the number of plants distributed in Dominica (for example) during six years:—

1891	... 9,000 plants.	1894	... 30,000 plants.
1892	... 17,000 „	1895	... 36,000 „
1893	... 22,000 „	1896	... 42,000 „

These are, of course, *all* economic plants. The great demand has been for Liberian coffee, of which over 75,000 plants have been sent out. The others were chiefly limes, cacao, oranges, kola, nutmegs, and vanilla. The cost of a cacao plant in a pot is a farthing, of coffee plants less than a farthing, whilst nutmegs cost a penny. The distribution of seeds was also large, no less than 2,233 cacao-pods of good varieties, capable of yielding 44,660 plants, having been sent out to local planters in three years. At present the most flourishing industry is the production of lime juice. And yet fifty years ago it exported 6,000,000 pounds of coffee in one year. These are suggestive figures. To-day the people are emigrating to Cayenne and Venezuela, and those who remain are in immediate need of assistance. The working of the Government's scheme is well illustrated by Dr. Morris's plan for dealing with it when he reaches the islands. Dominica, he thinks, may be saved by establishing at once a trade in bananas and other fruit with New York. One of the great difficulties which has hitherto stood in the way of the small cultivator has been the absence of markets. It is to help him to ship his produce, fruit, or whatever it may be, the moment it is ready that the subsidy for the establishment of a special line of coasting steamers has been granted. The following is a list of West Indian products which economic Botanical Departments have introduced within a hundred years:—Ginger, nutmeg, clove, black pepper, guinea grass, sago palm, Bourbon cane, coffee, mango, logwood, cinnamon, bamboo, camphor tree, orange, lime, citron, yam, cacao, shaddock, lemon, and ever so many more.

THE CRISIS IN TEA.

The *I.P.G.* has the following:—

Tea has had a number of ups and downs since it was first started in India, but we very much doubt if it has ever had to face such a crisis as the present season is likely to produce. To many it may appear as if this was alarmist vaporing, but a reference to the averages realised by gardens at the weekly auctions must be bitter food for reflection, to say the least. At one time it was thought extremely economical working if tea could be turned out locally at 5 annas per pound; and, indeed, that is cheap working for the Brahmaputra Valley still; but when we mentioned 5 annas we meant it to include all Districts—Dooars, Terai, Darjeeling, Cachar, Sylhet and Assam; or we might better define the latter three by the Surma and Brahmaputra Valleys. One district works cheaply, the next one moderately, another one expensively, so that we think a fair average to strike might possibly be 5 annas per pound. Now in the case of gardens that sell in Calcutta, we have to add Calcutta charges; and in the case of others, not only Calcutta but London charges; and this adds, say, 25 per cent. for those selling locally; and, say, 30 per cent. for those who send their teas to London; so that to cover expenses alone, the crop would require to realise 6¼ annas for Calcutta-sold teas and 6½ annas for London ones.

Turning to the Annual Report on Tea Culture by the Assam Government for 1897, we find that the crops for that year realised—Surma Valley teas an average of 5 annas 11 pies per pound, and the Brahmaputra 7 annas 8 pies. of course, in this report there is no account of the Dooars teas, but judging from the place that Dooars and the Terai generally hold in Messrs. Watson, Sibthorp and Company's valuable weekly comparative tables, there is no reason to suppose (in fact the reverse) that the average of those two district teas was higher than that of the Surma Valley, so that we may for all purposes put down the average of the various districts—the Terai, Dooars, Cachar and Sylhet—as 5 annas 11 pies; or, for simplicity, 6 annas; whilst if we give Darjeeling one and-a-half annas over Assam, we think the comparison would be about fair, *i.e.*:—

Assam	...	...	... 7 annas 8 pies.
Darjeeling	...	...	... 9 „ 3 „
Cachar and Sylhet	...		... 6 „
Dooars and Terai	...		... 6 „

Thus we say that even with last year's prices, the margin or profit in the case of the Dooars, Sylhet, Cachar and Terai gardens is very small, and this is fully borne out by the printed reports of many of the companies of these districts, and what is it likely to be with the prices ruling in 1898? Have our agents and planters yet brought themselves to face the grim facts? The market this year is, we should say, quite an anna worse than last year, and that means an average price of 5 annas. To convince our readers we might arrive at the results here foreshadowed in another way. The average yield put down in the official paper referred to above is:—

Brahmaputra Valley	...	388lb. per acre,
Surma Valley	...	435 „ „
For the whole province	...	408 „ „

which is just over 5 maunds per acre, or, if turned into rupees, Rs.137-8-0 per acre for the Surma Valley and Rs.157-8-0 for the Brahmaputra. In this calculation, of course, we have taken into consideration the fall of one anna per pound in price this year.

Now it is a pretty well-known axiom that bushes will not yield unless liberal cultivation is given, more especially in the poorer soils of the Surma Valley, so that it is impossible to economise in this direction; and given this ordinary cultivation, we do not think we are erring on the side of extravagance if we put local expenditure on gardens in the Surma Valley at Rs.110 per acre, and in the Brahmaputra we require to enhance that to Rs.125. We are not very sure if there are many gardens that work to the above figures. That it can be done is instanced by more than one company's published accounts, and those who cannot do it will have to make room for those who can; but this is beside the question at present, although we may revert to it at some future date. Deducting then Rs.110 from the result of tea sold in the Surma Valley, we find a balance of Rs.27-8-0 left per acre to meet Calcutta, or Calcutta and London, charges, as the case may be; and, in the case of the Brahmaputra Valley, a balance of the same.

In our preliminary examination we said that 25 to 30 per cent. was considered a fair calculation for the item, and this is exactly what is left in the case of both Valleys, but what is the shareholder to get? With regard to the Dooars, Terai and Darjeeling, the conditions are so different that we cannot well compare them with these Assam tea-producing districts. The labour question is quite on a different footing. In the case of the Dooars, the average pay of coolies is so much higher that probably the increased yield is swallowed up in meeting this item, while the same may be said of the Terai. In Darjeeling the yield is very much smaller, and the labour conditions so different, that comparison is hardly possible, although we believe the results will work out pretty much the same. We have purposely kept our figures of expenditure very low, and have, we think, erred on the side of caution, but let us hope we are wrong and have exaggerated these; for in this case there might be a bone to throw to the poor shareholder, although an extremely small one. Meantime, let us glance through the weekly sales and see how many figure in the four-anna column. As shown above, this is bound to leave a heavy loss behind it. We do not wish to take too pessimistic a view of tea as an industry, but it is at present in the throes of a crisis that will shake it to its foundation, and it behoves those interested to try and put their houses in order. Economy must be enforced, both in Calcutta and in the districts generally, and there must be no sentimental feeling allowed to stop the process. The days of rupee or even eight anna averages are gone never to return we are afraid, and the only thing to do is to look round and see where economy can be introduced without sacrificing efficiency. We propose to consider this aspect of the question in another article.

DISEASES OF THE COFFEE PLANT.

THE following is the *Madras Mail's* review of the Committee Proceedings of the U.P.A.S.I. on the subject of Leaf Disease:—

When reporting at some length, last month, the proceedings of the Annual Meeting of the U.P.A.S.I., we were compelled to con our remarks to what had passed in open meeting. Every y however, the chief interest of these meetings centres in the discussi that are held in Committee. Of a loose and somewhat infor character, they are extremely difficult to report with accuracy, the fact that two or three speakers occasionally express their se ments at one time detracts nothing from the value of remarks emanate from various speakers, representing at times opinions widely apart as the districts in which these speakers pursue th ordinary occupation as planters. At the meeting held last mo very interesting discussions on coffee leaf disease, scale pests, employment of an Agricultural Chemist took place in Commit A copy of the Report of these proceedings has now been placed our disposal, and we feel sure that our readers will be interested a brief review. On the subject of the employment of one or m Agricultural Chemists in Southern India our opinions were expres quite recently, and as the U.P.A.S.I. is in accord with them, main consideration may now be given to leaf disease and scale pe It will be seen from the epitome of the planters' remarks that purpose to give in the sequel, that these two matters were in sev instances bracketed together. We may remark that the discuss sprang from a speech by Mr. J. A. Harris, in open meeting. report of this and of the conclusion arrived at after discussion Committee has already appeared in our columns, so our pres remarks will hinge almost entirely on what was said during p ceedings in Committee.

Mr. John Cameron, Superintendent of Government Gardens Mysore, was present to give the planters the benefit of his experie and experiments, and the earlier Committee proceedings took form of an examination of this gentleman, questions being asked various planters and promptly replied to by Mr. Cameron. In course of this examination side lights were thrown on Mr. Broo Mockett's experiments in hybridisation in Mysore. Mr. Came urges hybridisation very strongly. He thinks about six years wo have to elapse before the results of experiments could be re known, and he was interested to learn how much progress already been made by Mr. Brooke-Mockett and how systematic that gentleman had proceeded. We gather from the remarks different speakers that the object of hybridisation is to strengt the constitution of plants so as to enable them to resist dise Expressed in another way, it is to improve the strain and the se In yet another way we may say that the object is to give "n blood" to the plants: always with a view to strengthening th not merely for the purpose of increasing or improving the yield, so as to develop their powers of resistance to disease. In course of his remarks Mr. Cameron expressed the belief not me that the strain of coffee seed now used has deteriorated, but t "any kind of cultivation that goes on for a very long period with change must gradually deteriorate; and *a time will come w sterility will set in.*" The words we italicise are of very gr significance. True, coffee has been under cultivation in India many years, and whatever deterioration there has been has not to sterility. Still, if there is even a remote danger of this, plant will assuredly realise the importance of improving the strain. question was asked by Mr. Parton:—"Can you increase fertility careful cultivation?" The answer was, "Yes." But the greater advantage to be derived from hybridisation was thus pressed by Mr. Cameron:—"You can increase fertility by a car selection of the seed, choosing large and heavy beans; but t alone will not do sufficient good. Selection comes a good lower than hybridisation as a means of improving your crops." conclusion arrived at was that planters should study and prac hybridisation, but that in the meantime they should select heaviest, largest and finest seed, and should go in for high cult tion so as to make the most of existing strains until such time hybridisation may result in the establishment of new and m valuable types.

The advantages of hybridisation are not a matter of speculati They have been proved over and over again with coffee, and scie has established the soundness of the general creed. But the resu of amateurs' experiments are, naturally, varied. Mr. Hockin had experience in Wynaad, and has learnt not to trust entirely appearances. After having Liberian nurseries for several ye without a hybrid resulting, he suddenly discovered some. T grew rapidly. They were pictures of health and strength. "La canoe-shaped beans" promised great things, and Mr. Hockin c cluded that Liberian was the father and Arabica the mother-pla

, the plants raised from these seeds got leaf-disease as badly or e than ordinary Arabica, and turned out of no value. From Mr. Hockin concludes that the vigour to resist leaf-disease only igs to hybrids, of which Liberian is the mother-plant. This is point that should be settled by prolonged, systematic experi-. Throughout all such experiments, too, planters must bear ily in mind Mr. Cameron's warning that in seeking the better may find the worse. In trying to get hybrids indiscriminately, aid, "you may get all sorts of rubbish that will do your estates harm than good if they are allowed to propagate; and this be prevented at all hazards." There is apparently another also. Mr. H. O. Newport alluded to the tendency of Libe- to be more largely attacked by scale pests. Mr. Graham erson stated that Mr. Brooke-Mockett's hybrids were free from ; but it remains for experiments to determine whether this is a lt of hybridisation or merely an immunity due to local or atic conditions, or to specially careful cultivation.

appears to be beyond question that Liberian requires high vation, ample shade and plenty of moisture. The conditions of vation of Arabica are different. Under ordinary circumstances the two plants flower at different times, so that cross-fertilisa- cannot be managed. Special arrangements must be made, efore, wherever hybridisation is attempted, and in particular, and vigilance must be exercised to see that deterioration of n does not result from the very measure adopted for its improve-. There is no reason why experiments should be confined to rian and Arabica. It was certainly argued at the meeting red to that Liberian alone is a distinct species and that Mocha Jamaica and South American sorts are all from Arabica stock. there are such great divergences of type established during the se of many years by different climatic and other influences that e is no reason why hybrids from plants grown from the finest aica seed, for instance, and the finest Coorg or Mysore or aroy seed, should not be tried. The subject is one of the greatest ble interest, and solid practical advantages may be anticipated the attention that planters are now giving it.

TEA PRUNING.

WRITING from Northern India, "1874" contributes an resting addition to the recent discussion on tea-pruning. take the following excerpt from his remarks :—

y idea is that tea is cut down for the benefit of a few seasons, e expense of the general good of the estate, and that the less re the treatment of tea bushes, the better they will repay the given them.

have seen today an admirable illustration of my theory. An old has got one straight stem, about ¾ of an inch in diameter; it is t from the ground to the height of 2 feet, about 2 feet it shows prunings. The growth on this stem is fully 18 inches since the pruning. The growth on the rest of the bush is barely 12 inches e same time. I have got only this *one* straight stem because ve not as yet systematically cut out old wood—the old stems on bush have all been pruned several times and have probably been down twice, but they are still too good to sacrifice. Not that I onvinced of what was only a theory, but has been proved by rience I will cut out *some* wood from each bush at each pruning. k forward for the letter referred to, and I shall be able to judge ther the "other treatment" will suit my garden.

found this place a mass of gnarled stems; I fancy that about er cent. are straight and clean now (which *I* have allowed to), and within five years I hope to have *all* the stems straight and t up to the yielding point. During these five years I have to ease the yield, to keep pace with a falling market, or make much tea of the same amount. The question is, shall I do this more y by cutting down 1/5th of the estate yearly, or by my present od of preserving the yielding surface and removing the least l wood from each bush. This point is worthy of one of your lar letters, by which you get the opinion of many practical men. ers of this sort will do us more good than Chemical exports.

e second letter which I find in your *Tropical Agriculturist* of ust, 1898, by one "Willing to Try," shows me that I have set thinking, and thinking also will do more for us than "Experts." his letter my system is said to be "New," but it is not new. I all the ideas from the Tea Cyclopædia of 1881. I have published not "*a new system*," but my experience of, say, four years of a common-sense system. Take for instance one sentence on page 88 of the Cyclopædia: "We must never forget that the severity of a surgical operation is, except perhaps in the most desperate cases, always proportionate to the stamina of the patient. Similarly when contemplating how bushes are to be pruned, we must never forget to proportion the severity of the cutting to the condition of the bushes and the richness or poverty of the soil."

This hit my fancy, and I said that I would try. I found bushes which were rapidly becoming pensioners. I gave the old things a quiet time, more cultivation, no cutting down, and really the effect is *very* good. You can cut down a plot of tea on good land and perhaps increase the yield, *but* in my opinion that plot will never again give the same average yield from year to year.

I did not intend to offer advice to men who have good tea bushes and good soil, but still I think that the best tea treated as I suggest from the beginning, and supplied with labour sufficient to take all the leaf produced, would not stop short of 1,600lb. per acre.

My garden yields 350lb. of good tea per annum per acre. If it had been treated from the first on my present system, it would give now fully 800lb. per acre of the same leaf. Some of the bushes are splendid, and yield even now at rather more than this rate. With all the bushes equally good, I would have 90 per cent. of the possible "plucking area;" now I have barely 50 per cent. of the ground covered by leaf. The good yield would have encouraged better cultivation and probably manuring; in fact, this Company would have been made fully four times its present value. And the reason is that each man who worked it worked *for the season*, and not for the welfare of the estate. And I also believe that this is the reason why cutting down has become *universal*, so much so that it is hard to find a single instance of a tea estate that has not been cut down several times.

I may be utterly wrong, and perhaps the universal practice is the right one, and perhaps I myself may find in course of time that cutting down *is* necessary, but I have *no* doubt myself that I am right, and for this reason I believe that my experience will prove useful to many men, particularly to those who are taking charge of old gardens and who contemplate cutting down as the only remedy to renew the yield of the bushes. Cut down the whole show if you can afford to give it a rest and let it grow again before you pluck it, so that the following year you can prune the bushes to two or three feet, and after that never cut down again. If you can't afford to wait for new bushes, then cut out a percentage of the worst wood yearly, and let the new wood growing up from below be pruned as high as possible so as to give the greatest possible surface to the bush. Here is another hint from my old friend "For each well-developed new stem cut out the worst or least productive stem. In this way a bush may be renewed in a year or two instead of butchered in five minutes"; and another: "It may be taken as a general rule that the higher the class of plant, *i.e.*, the nearer it approaches indigenous (and the furthest from China), the more sparing one must be with the pruning knife. I trust that no one will accuse me of suggesting that my system of pruning will give 1,600lb. of tea per acre from an average garden and with average labour for plucking.

The following will be a useful

TABLE OF THE LABOUR REQUIRED FOR PLUCKING.

8 months for plucking = 240 days.

Per acre.			1	2	3	
Tea.	Leaf.	Pluckings.	cooly.	coolies.	coolies.	
400	1,600	24	34	17	11½	coarse tea.
800	3,200	24	68	34	22⅓	coarse tea.
1,600	6,400	24	136	68	45⅓	coarse tea.
400	1,600	48	17	8½	5⅔	finest tea.
800	3,200	48	34	17	10½	finest tea.
1,600	6,400	48	68	34	29⅓	finest tea.

Referring to the above, it will be seen that given one cooly per acre, who can pluck 34lb. of leaf at intervals of ten days, the acre will yield 400lb. of coarse tea. Also that with plucking at intervals of five days, one cooly per acre on an average of 17lb. of leaf per cooly will give a yield of 400lb. of *fine tea*. It would require a good acre to yield every five days, but such tea is not at all uncommon. But when you come to the 1,600lb. per acre, it is seen that at intervals of ten days (*i.e.*, for coarse tea) one cooly would have to pluck 168lb. of leaf. Two coolies plucking 68lb. each would do and be practicable off a very fine plot of tea. But to get 1,600lb. of *fine tea* per acre would require at least 2½ coolies per acre as an average, *i.e.*, at some seasons the plot would yield no more than 20lb. per cooly, and during

the rushes it would give 40 to 50lb. per cooly. You must have the best of bushes, and the best of coolies, and lots of them.

To conclude, I may state that this system of pruning is of special value against the effects of drought. The bad effects of hard cutting are apparent according to the severity of the droughts. In the Dooars, a bush can be collar-pruned and be a bush again in a few years, but it seems to me such a waste of everything to spoil a good plucking surface instead of preserving it intact and using sensible methods.

I hope soon to see a letter advocating the periodical cutting down of tea bushes.

Between the two opposite systems we shall all gain some good lessons—and be guided chiefly by our circumstances. But at any rate more of us will *know* what we are doing and not be ruled by convention.

COFFEE IN SOUTH SYLHET.

CEYLON has abandoned King Coffee and sworn allegiance to Green Tea, but South Sylhet is coquetting with the King after giving the green a fair trial. The South Sylhet correspondent of the *Planter* writes:—

I have never had any practical experience in coffee growing, that is, I have never had any experience under a practical coffee grower, and have been treating the plant exactly as I would treat any other similar fruiting tree. This treatment, I find to be, in the main, the same as that recommended by Coorg. The description of the Coorg climate is very similar to what I would describe that of South Sylhet. Same kind of spring, monsoon, and north-east showers during September and October. The two principal differences are that we, on the average, get very nearly double his rainfall, and the dry months in Coorg seem to be very much better than we get them here. It is Coorg seed that my plants are from, and, curiously enough, when I sent a sample to Messrs. Binny and Company, of Madras, their manager at Bangalore reported that the sample was more like the Mysore type than Coorg, round berry, good colour, but silver skin persistent. I suppose the "but" meant that the silver skin being persistent was an objection. He valued the sample as being equal in value to that of Wynaad coffee.

LONGEVITY OF COFFEE.

A letter in front of me from a planting friend says that I might enquire if it has ever been definitely ascertained if coffee, given a suitable climate, will not grow and fruit for an indefinite number of years, if intelligently treated, at even a low elevation than the lowest mentioned by Coorg—800 feet? The writer goes on to say that he has bushes six years of age, and that they have fruited heavily every year for the last three years, and are loaded with berries this year. He has not many bushes, only a few in his compound, but these are quite sufficient to keep the bungalow supplied with a decidedly better quality of coffee than he can buy. He has top dressed them with well rotted manure twice during the years they have been fruiting. I have known bushes considerabl than six years of age growing well and fruit yearly, but as tioned in a former letter, they were in the form of standard the long bare stem or had been allowed to grow much as th a mind, with dozens of suckers, each striving against the ot the leadership. Perhaps a borer insect would come along its eggs on two or three of the would-be main stems, stoppin progress and allowing the others to push ahead. After the eg hatched and the borer had done its work a puff of wind would the affected branch or branches over, where they were allo remain as clear evidence to everyone that coffee would neve South Sylhet. There is yet another system which has bee with a row of bushes in a bungalow compound. After being themselves for some years, they were getting too jungly and bl out the air from the bungalow, so the manager put a coupl pruning coolies on to cut them down, the same as they wer with the tea. As far as health is concerned the last time I sa bushes they were looking all that could be desired. They stoo three or four feet high, and would measure about eight feet th but simply one tangled mass of wood. I have heard it said few bushes in a compound will do very well, but that if gr quantity it would never thrive. Now what I want to know score of coffee bushes will do well and fruit well for a doze planted together in a compound, why will a hundred acres no well, if treated properly, planted in a field? It has been sa coffee has been very much overdone as well as tea. This said of most things nowadays, but I am informed by a Londo man that there is a far greater margin to work upon wit than there is with tea. Moreover, I am further informed coffee can be grown in South Sylhet to anything that will co Wynaad coffee in quality, there is not the slightest fear of it successful venture commercially. The coffee of Brazil is means the best coffee which is put on the London marke matter of fact some of the Brazil coffees were the very wo on the market, and sometimes hardly saleable,—and these were grown where it cost the growers more than twelve ti amount for their labour that it would cost a South Sylhet And, even at that the labour was no better for the work than would be; as a matter of fact, not so good as the better class jungly coolies, for which the Brazil growers would only be to ed to exchange their present labour force if they had the oppo I have been told that Arabian coffee will not flourish below a elevation, but I have never been told the reason why. I ha asked, and as a rule the answer has been, "Well, all coffee are at a high elevation." Or perhaps, the answer may be va being "Well, so and so says so." Is the coffee-plant (Ara alpine or a semi-alpine plant to start with? Coffea Tetrandra a native of Sylhet, Chittagong, and the whole eastern bo Bengal.

VARIETIES OF THE BERRY.

Coffea Bengalensis is similar in appearance to Arabica, indigenous to the north-eastern frontier, chiefly about Sylhe thence brought many years ago to Calcutta, where for some

OAKLANDS BUTTER,

A Delicious Product of an Ideal Dairy.

The Dairy is situated on a Coffee Estate at Yelehanka, far removed from human habitation unhealthy surroundings. Has a large stock of superior Imported Cattle. It is under the imm control of Europeans, and is a model of perfect cleanliness.

The Butter is guaranteed to be absolutely pure. It is packed in ½ and 1 lb. air-tight tins.

We shall be glad to register your name for a bi-weekly, weekly or fortnightly consignme we do with our numerous other regular customers. The Butter sent out is packed a day previous date of despatch and can safely be kept any reasonable length of time (a fortnight at least) withou deterioration of quality.

THE BUTTER IS SENT BY RAIL AT HALF THE PARCEL RATE.

Sole Agents: ROYAL EMPORIU

[w.—3-9-98—t.f.o.] BANGALORE.

s much cultivated under the idea that it was the real coffee of abia, but it was found to be of inferior quality and not so produce as the latter variety.

Coffea Pedunculata is a native of the Moluccas, Coffea Angustiia is a native of Pigeon Island in the Malay Archipelago. Coffea berica is a native of West Africa and so is Coffea Stenophylla. ffea Arabica is described as a native of Arabica, but it originally supposed to have hailed from Abyssinia to which country it is ligenous. But, although for some years I have given this plant nsiderable attention, I cannot find it anywhere described as being ative of any particular altitude. If anything the botanical desptions would lead one to the conclusion that it was a native of a instead of a high elevation.

UNSUITABILITY OF SYLHET TO COFFEE.

I have found great difficulty in getting any reliable and definite ason why coffee will not succeed in Sylhet, but any number of ople tell me that it will not do so, at the same time supplementing eir statement by such an expression as "At the same time I must nfess that I know nothing at all about it." Dr. (now Sir George) ng told me that he would not like to give a definite opinion, alough he had doubts of such a thorough equatorial plant succeedg so far north. That was an expression of opinion, but was by no eans satisfactory or definite. Another authority told me that uth Sylhet was by no means too far north, that we were just on e outside of the Tropic of Cancer, and being so far north fully mpensated for our want of elevation which was found to be necesy nearer the equator; and thought our climate highly suitable for ffee cultivation, equal, if not superior, to the Mysore coffee-growing tricts. Such or some of the opinion I have had, and I will be inested in Coorg's answer to my planting friend's question above.

DAMAGE FROM MOISTURE.

I noticed in a former Coorg letter that the writer mentions about young coffee supplies, which I take to be young plants planted t to fill vacancies, getting clogged up the stem with earth during heavy rain owing to the drip from the shade trees, and that this ght to be removed immediately, because if left to get dry and rd, the tender bark of the young plant was apt to get damaged en removing it. We have been having a wet spell for a few weeks here and all my young plants got clogged up the same way to even ove the *janum* leaves (catyledons); but, when I put on people to ke this earth off, I found that the young plants had completely ed it with a mass of young white fibrous rootless, which had rung out from the stems of the young plants. When I saw this I d the coolies to fork all round, and level the surrounding soil up the top of the earth on the stems of the plants. This could all e more easily be done owing to the young plants in most cases ing in a slight depression, as very large holes were made and led with the top soil, and this soil, after planting, had sunk a tle. Although young coffee plants do not seem to grow so fast as ung tea plants, I think they are (in their young state at least) far ore tenacious of life.

A TRICKY COOLY.

One day about a fortnight ago, when walking through and amining the work of some coolies who were weeding and forking und the young plants, I noticed a plant which somehow had not e same appearance as the others, but, if I had been asked where e difference lay, I could not have told, as the plant had the pearance of being all right and looking as healthy as its neighbours. The earth had just been stirred up round about it. I stooped and ught it by the top when it came away in my hand without any sistance. Upon examination I found that the cooly, when stirring the soil, had cut the plant through a little under the surface with e dao by carelessly stirring too near the plant. To hide the fault had simply stuck the inch or so of stem, which was left on the ant below the *janum* leaves, into the soil, so that the plant had the pearance, for the time, of being all right. I knew that this was very rare occurrence and it was too small a matter to get one's mp up about, so I just stuck it in as it was again and for the time rgot all about it. The plant was in a conspicuous place where I s passing three or four times daily, and where the coolies were ntinually going and coming to and from their work. I noticed at the plant kept fresh and did not flag much, but as the weather s continually dull and cool I did not think much of that until a ek or more had passed, when, upon examining it closely, I found at it had thrown out nearly a dozen of rootlets from about the ils of the *janum* leaves, whose spongioles were penetrating the il in all directions.

LADY BIRDS.

THE following is a report of the discussion that took place in Committee of the U.P.A.S.I. during the Annual Meeting last month :—

Mr. H. G. PARSONS :—I should like to ask Mr. Newport what his opinion is about this scheme. Some expert has said, I believe, that we are proceeding on dangerous lines. What are your views with regard to these remarks ?

Mr. H. O. NEWPORT :—I think Mr. Parsons is asking about Professor Blandford's statement. I have replied to that in the last paragraph or two of my report. I would like to read it, because I think it was an entirely harsh criticism, and I hardly think Professor Blandford had all the facts of our scheme before him when he wrote those remarks. (Mr. Newport here read the last few paragraphs of his Report.)

Mr. H. G. PARSONS :—Therefore the inference drawn by Professor Blandford was altogether wrong ?

Mr. H. O. NEWPORT :—I do not think he understood that I was bringing them out on ice, because in his letter he mentions that we would have to bring them out living on scale pests. That would have made the experiment distinctly dangerous.

Mr. J. W. HOCKIN :—Are they not bringing lady-birds to Ceylon in Wardian cases ?

Mr. H. O. NEWPORT :—Yes, but I do not know what has been the result. I would, therefore, suggest that we should wait and see whether the result of this method of importing has been satisfactory.

The CHAIRMAN :—I may mention that the Secretary has already written to Mr. Green, and asked to be informed as to the result as soon as this information is available.

Mr. E. G. WINDLE :—I would like to ask Mr. Newport what he has to say to a criticism which appeared in the *Madras Mail* to the effect that the lady-birds were not killed on board ship, as would appear from a perusal of his Report, but that the failure was due to a want of knowledge in thawing them out.

Mr. H. O. NEWPORT :—The article referred to originally appeared in *Planting Opinion*. My explanation with regard to that is, that I am not sufficient of an entomologist to say. The insects looked as if they ought to come out alive, but I could get no signs of life out of them. It may possibly have been that my inexperience and ignorance in not being able to than them out alive was the cause of the failure.

Mr. E. G. WINDLE :—Could not an entomologist have given us an idea on that point ?

Mr. H. O. NEWPORT :—I do not think an entomologist could have helped us unless——

Mr. J. W. HOCKIN :—Had they been thawed out in Australia ?

Mr. H. O. NEWPORT :—Yes, but they had not been on ice for such a long time. When they were thawed out the result was satisfactory. I knew what had to be done and followed that, but I had no experience on the subject. I set the insects out in the shade and allowed the temperature slowly to rise.

Mr. J. W. HOCKIN:—Could you not have found out from Professor Koebele how to thaw them out ?

Mr. H. O. NEWPORT:—I could, if I had seen him personally. But I had only his Report, and I could find nothing on the subject in it.

Mr. W. H. SPROTT :—Could not the Secretary write to him and ask him for any information that he could give us ?

Mr. H. O. NEWPORT :—Yes, certainly, on this point as well as on any other point.

The CHAIRMAN :—I would like to ask Mr. Windle and Mr. Newport if they have had any attacks this year badly.

Mr. H. O. NEWPORT :—Yes, we have been attacked this year very badly.

Mr. E. G. WINDLE :—We have had the green bug very badly; but not what the Lower Pulneys are suffering from.

Mr. H. G. PARSONS :—Are we to understand that it was owing to the action of the Captain of the steamer that you were not allowed to see the insects ?

Mr. H. O. NEWPORT :—I could not have seen them in any case in sending the insects in this manner. The New South Wales and Californian planters, I understand, made a special arrangement with the shipping company that carried their insects. They had a specially constructed small chamber built on the side of the cold chamber, which was accessible from outside. They paid £17 or so for the rental of this small space, and in this way they could watch the temperature as well as the cases without opening the refrigerator door. Once the refrigerator doors are closed, the Engineer will not open it until the ship arrives at its port of destination. It was not so much my not being able to get at the case that I complained about, as that the case was allowed to get wet and damp. As I said in my report, this must have been due to hot air having been allowed to get at the case which must have had a bad effect on the insects. If I had been able to see it, this bad effect might have been avoided. I insisted that the case was to be kept dry ; but it was not kept dry.

Mr. H. G. PARSONS :—Then the question of a rise in the temperature is one of the difficulties you had to contend with ?

Mr. H. O. NEWPORT :—Yes.

Mr. J. W. HOCKIN (referring to the mounted specimens) :—Which is the best sort ?

Mr. H. O. NEWPORT :—*Rhizobius ventralis* is a very good sort. It was the kind sent to California. *Cryptolæmus montrouzerii* is another sort that has done very good work. On the left hand top corner is *Orcus Australasia*. These were the three varieties I brought out, and I may mention that Professor Blandford thought the *Orcus* variety might do good. Mr. Tryon pointed them out to me, and suggested that I might bring them over. There are other varieties there, some good and some bad. These are not all animal feeders, some being vegetable feeders. I had to collect all sorts and bring them to Mr. Tryon to identify. He gave me their names and showed me how to identify the different varieties that I would need. Among other interesting things there you will find in one corner of the case the *larvæ* cases of a certain moth which feeds on scale pests. It is not unlike the English caddis worm larvæ. It forms its case of the shell of the dead scale.

The CHAIRMAN :—What suggestions have you to make as to future action ?

Mr. H. O. NEWPORT :—I trust the Association will not let the matter drop because of a failure at the commencement. The first consignment sent from Queensland to Hawaii was unsuccessful ; but subsequent consignments turned out well. I would suggest that the Association before taking any further action should collect all the information possible on the matter. We might ask through the Government for Professor Blandford's suggestions as to future action, especially as he has criticised our present action.

The CHAIRMAN :—I may mention that the Secretary has written to Mr. Thiselton Dyer and Professor Blandford for any suggestion they may have to make for thawing out the lady-birds.

Mr. H. O. NEWPORT :—I would suggest also that we should collect whatever information we can from Mr. Green, and also the entomologist at the Calcutta Museum.

The CHAIRMAN here read a letter received from Mr. Green, of Ceylon.

Mr. G. R. OLIVER :—What has become of the local lady-bird ?

Mr. H. O. NEWPORT :—It is slightly increasing, and is doing excellent work. I may say that the block of coffee on which I first noticed this lady-bird has had less scale on it during the last two years than any other block of coffee on the estate. They don't increase fast, because they lay so few eggs and have many natural enemies.

Mr. R. GOMPERTZ :—I should like to hear from Mr. New his opinion as to the feasibility of getting over eggs Australia.

Mr. H. O. NEWPORT :—That would be an excellent idea doubt ; because eggs could be transported with much less I would point out, however, that it would take a year or eigh months of study and work before it could be possible to get t The eggs are so minute that you could not find them. would have to collect the lady-birds, keep them on plants scale pests on them, and let them go through the whole co of their lives. You would then have to examine minutely leaves of the plants themselves to collect the eggs. Finally, would have to collect such an enormous quantity of eggs at time that the possibility of the scheme seems out of questio

Mr. R. GOMPERTZ :—But I suppose a person interested in s ing the eggs would do all that himself.

Mr. H. O. NEWPORT :—He might do it or he might not d If he were a breeder of lady-birds he might do it, but it w take an enormous amount of time and trouble, and would oc the energies of one man altogether. As far as the Wardian go, I understand that the lady-birds in these cases are a and if they are alive, they have to be fed on living scale-p This being the case, Professor Blandford's remarks apply to method rather than to our method as a means of bringing w scale-pests into India.

Mr. R. GOMPERTZ :—You might get rid of the scale-pests be you arrive in India.

Mr. H. O. NEWPORT :—The lady-birds might die before got used to the new food.

The CHAIRMAN :—What do you think the next move ought to

Mr. H. O. NEWPORT :—I have already suggested that we sh get what evidence we can by writing to the different source information ; but we should take no further action unti have heard from all possible quarters.

The CHAIRMAN :—You think we should do nothing at present to take steps to get all the information we can. We have that already.

Mr. H. O. NEWPORT :—We should get even more informa and *advice*, and, as soon as we have sufficient, we should ac it. Before going into open meeting, I should like to ask for di tions as to what is to be done with the apparatus. The appar that is on the table I shall hand over to the Secretary. Ther however, other apparatus, such as the brine-chest that I sh like to know how to dispose of. It is, of course, the propert the Association. Then again I have made reference in report to an ice-chest which I had to leave in Australia. chest cost originally £4-5-0, and I left it to be sold as soo the summer came on. That also belongs to the Association, I have suggested in my report that when I receive the money this chest I should remit it to the Secretary.

Mr. W. L. EDMISTON :—I think, and I fancy from what I seen, that we have in this country lady-birds that might s our purpose, and although Mr. Newport has told us tha does not consider himself sufficiently an expert in the ma I think if his services were made available to us for a s time we might well spend some money in enquiring into subject of lady-birds inimical to scale-pests in this cou before we spend any more money abroad.

At this stage Mr. Newport proposed the following resolution That this Association do collect all possible information o subject of the importation of lady-birds from Professor Bland and others, and in time await the result of Mr. Green's exp ments in Ceylon before taking steps in the importation of fur consignments, and that, as soon as possible, a supply of *Cocc lidæ* be imported by the most approved method and experime with in South India.

The proposition was seconded by Mr. J. W. Hockin.

Mr. E. G. WINDLE :—May I suggest the inclusion of the words f such be considered the best means of destroying scale-pests ?"

Mr. H. O. NEWPORT :—I have no objection to the inclusion of e words.

The CHAIRMAN :—It seems to me the resolution is complete itself.

Mr. W. L. EDMISTON :—I cannot help thinking that it is a pity waste money on importation from foreign countries, while ere is still a chance of finding lady-birds in our own country. know the services of a skilled entomlogist are not available; t Mr. Newport is the nearest approach to a skilled entomologist have, and he has already told us that in the event of our requir- him to make further enquiries he is prepared to give his vices. I wish to move the following amendment :—"That hough the services of a thoroughly qualified entomologist is t at present available, the services of the best man at our mediate disposal be forthwith employed as a temporary easure to study the indigenous varieties of lady-birds until such ne as the employment of a thoroughly qualified man is avail- le." I do not think the experiment will cost us much money.

Mr. H. M. KNIGHT seconded the amendment.

The CHAIRMAN :—It seems to be Mr. Edmiston's opinion that will save money by the arrangement he proposes. It seems me we are more likely to save money by importing lady-birds om outside. If Mr. Edmiston's amendment is carried, we will ve to spend money to ascertain if lady-birds, which may or may t exist, are forthcoming. It seems to me we will be incurring eater expenditure than under the former scheme. I would ggest that you might effect a compromise by the following solution :—"That this Association do collect all possible infor- ation on the subject of the importation of lady-birds from rofessor Blandford and others, and that in the meantime await e result of Mr. Green's experiments before taking any further eps as to importation, and that all further action should be left the Committee."

Mr. H. O. NEWPORT :—That is different to Mr. Edmiston's nendment.

Mr. W. L. EDMISTON .—I don't want to stifle information : the ore we have the better it is for us. I only want to have enqui- es made as to what we have in this country before we go to the pense of getting them from outside. Our experience has ot been very satisfactory.

The CHAIRMAN :—Mr. Edmiston, I don't think your motion can ome as an amendment. I think we will vote on the original roposition, and then we will vote on yours as a separate resolu- on.

Mr. W. L. EDMISTON :—You can't do that, because you say othing further shall be done.

General Meeting was resumed, when Mr. Newport's resolution, econded by Mr. J. W. Hockin, was put to the vote and carried.

Mr. W. L. EDMISTON's Resolution was then put as a separate notion ; but after a very brief discussion in Committee as to the uestion of funds, Mr. Edmiston withdrew the motion, as he nderstood that the funds at the disposal of the Association were aised for the introduction of foreign lady-birds, and there would, herefore, be no money for his scheme.

MARKET REPORT.

COFFEE.

Messrs. Wm. Jas. and Hy. Thompson state in their Report of the Colonial Markets for the Week ending August 31*st*, 1898 :—Bank rate 2½%. Bombay Exchange closes at 1s 3$\frac{3}{32}$d. Brazil Exchange 7$\frac{17}{32}$d. Rupee paper 3½ % 62⅛. Silver 27⅝d per oz.

The market has shewn more firmness during the past week than for ome time previously, and the increased supply has met a good demand t about 1s to 2s per cwt. dearer for pale and medium kinds, whilst colory Columbian has sold with spirited competition at a further advance. East India has also sold at steady prices.

Brazil markets unchanged.

Daily receipts averaged 15,400 bags in Rio, and 27,800 bags in Santos.

Futures after having advanced about 2s 6d per cwt., in the early part of the week, have fluctuated, and although a large business has been done, prices shew a decline of 3d to 6d per cwt., below the highest point, viz. :—Good average Santos in Havre, September delivery, fcs. 39.25, in Hamburg pf. 32$\frac{1}{4}$, and No. 7 low ordinary Rio in New York $5.65.

To-day's London official quotations are :—

	Sept.	Oct.	Dec.	Mar., '99.	May.	July.	Sept.
SANTOS ...	31/3	31/6	32/-	33/-	33/3	33/9	34/-

Receipts in Brazil to 31st August compare as follows with previous years :—

	1898-99. Bags.	1897-98. Bags.	1896-97. Bags.
RIO	627,000	990,000	692,000
SANTOS	1,250,000	1,652,000	1,148,000
	1,877,000	2,642,000	1,840,000

London advices of 2nd inst. state :—

Plantation Ceylon sold under the hammer at again full prices. The small quantity of East India was eagerly competed for and a decided advance was paid for Coorg ; privately sales of Neilgherry have been made at good prices. For Costa Rica and Central American descriptions generally, the demand has been steadily maintained for all desirable qualities, but ordinary kinds have been dull of sale and a portion had to be withdrawn. "Futures" have been dull and prices have given way owing to large receipts, closing as follows :—

London	...Santos	...December delivery ...	31s. 6d.
New York	...No. 7 Rio ...	„ „ ...	5.85 cents.
Hamburg	...Santos ...	„ „ ...	32¼ pf.
Havre	...Santos ...	„ „ ...	38¾ francs.
Holland	...Good ordinary Java ...	...	37¼ cents.

Auctions this week have passed off as under :—

CEYLON.—*Plantation.*—13 casks 6 tierces 13 barrels 3 bags mostly sold, smalls 70s to 97s, middling and good middling 106s to 106s 6d, fine middling and bold 111s to 113s, pea-berry 113s 6d.

EAST INDIA.—468 bags sold :—*Coorg*, triage 39s to 41s, smalls 45s 6d to 49s, low middling to middling 77s 6d to 81s, faded and dull bold 88s to 99s, pea-berry 105s 6d. *Neilgherry*, triage 42s, smalls 47s 6d to 49s, low middling gray 57s 6d to 66s 6d, boldish 87s, pea-berry 89s 6d. *Wynaad*, triage and small 37s to 47s, low middling faded 56s.

EAST INDIA, *Liberian.*—29 bags mostly sold, triage 17s 6d to 19s, bold brown 26s 6d.

JAMAICA.—91 barrels 20 bags bought in.

COSTA RICA.—359 bags mostly sold, ordinary pale country-damaged 35s to 39s, good ordinary dull palish 48s, fine to fine fine ordinary greenish 54s to 58s 6d, pea-berry 59s to 59s 6d.

GUATEMALA.—Of 1,258 bags offered about 450 bags sold, smalls 32s 6d; London-cleaned, triage 29s to 33s 6d, smalls 36s to 40s, fine ordinary greenish 54s, middling 69s 6d, pea-berry 74s 6d to 89s.

SALVADOR.—Of 600 bags catalogued 400 bags sold, foxy pale 40s to 42s, pea-berry 45s 6d; London-cleaned, smalls 38s 6d to 42s, middling colory 70s, good middling 79s 6d, pea-berry 70s.

MEXICAN.—735 bags partly sold, fine ordinary faded pale 47s to 49s, colory 74s.

VENEZUELAN.—30 bags pale sold at 46s.

VERA PAZ.—580 bags offered and 100 bags sold, pea-berry 70s; London-cleaned, smalls 32s to 39s, good colory 87s 6d, pea-berry 92s.

NICARAGUA.—761 bags partly sold, triage 24s. low mixed black 33s 6d, ordinary foxy pale 36s 6d to 39s, good ordinary 40s to 40 6d, pea-berry 46s.

HONDURAS.—184 bags sold, dull foxy pale 36s to 39s 6d, ordinary dull pale 40s 6d to 41s.

COLUMBIAN.—4,775 bags offered and about 3,700 bags sold, small pale 35s to 38s, good ordinary pale 43s to 44s 6d, fine ordinary mottled pale Antiquia 50s to 53s, bold ditto 71s 6d, fine fine ordinary to low middling pale greenish 56s to 63s 6d, good middling to good 78s 6d to 86s, pea-berry 65s; London-cleaned, smalls 30s to 55s, damaged and dull soft mixed red 48s to 59s, low middling to middling 61s to 71s, good middling to good colory 75s to 86s 6d, good colory bold 96s to 97s 6d, fine bold 101s 6d, pea-berry 62s to 90s 6d.

BOLIVIAN.—58 bags London-cleaned, partly sold, mixed small 33s 6d.

BRAZIL.—450 bags Santos. bought in.

At auctions to-day only 10 casks 5 tierces 8 barrels Plantation Ceylon, 83 bags Porto Rico, 304 bags Columbian, 401 bags Guatemala, 292 bags Mexican were offered. A flat market to-day and Guatemala sold cheaper. Prices close 1s per cwt. lower on the week.

PEPPER.

Black.—Since our last the market has been quiet, and business was done at the commencement of the week at 5d per lb. for Singapore Oct.-Dec. shipment—a reduction of $\frac{1}{16}$d—but more recently a firmer feeling has been manifest and the decline recovered. The sales total up 150 tons as under:—

Singapore on the spot (basis fair)	$4\frac{3}{4}$d to —d
do Oct.-Dec. shipment	5d to $5\frac{3}{32}$d

The shipments of Black Pepper for the month of August compare as follows:—

	1st half.		2nd half.	
	1898.	1897.	1898.	1897.
U.K.—Sing.....340	340	250	100	50
,, Peng.....*nil*		*nil*	20	*nil*
Continent	100	140	360	80
United States	225	20	250	*nil*
Total tons ...	665	410	730	130

At public sale on the 31st ult. only 4 bags good clean Singapore were offered and these were bought in at $4\frac{3}{4}$d per lb.

White.—At the commencement of the week a very quiet feeling was manifest, and business was done for arrival at a decline of $\frac{1}{4}$d per lb.; but an improved tone has more recently been experienced and the decline has been partially made good. 200 tons embrace the sales this week, viz.:—

Singapore on the spot (basis fair)	$8\frac{1}{4}$d to $8\frac{3}{8}$d
do Aug.-Oct. shipment	$8\frac{1}{4}$d
do Oct.-Dec. do	$8\frac{1}{2}$d to $8\frac{3}{4}$d
Penang on the spot (basis fair)	$7\frac{3}{8}$d
do Sept.-Nov. shipment	$7\frac{11}{16}$d
do Oct.-Dec. do	$7\frac{13}{16}$d
do Nov.-Jan. do	$7\frac{3}{4}$d to $7\frac{13}{16}$d
do Dec.-Feb. do	$7\frac{7}{8}$d

The shipments of White Pepper for the month of August compare as follows:—

	1st half.		2nd half.	
	1898.	1897.	1898.	1897.
U.K.—Sing.....300	370	60	150	120
,, Peng..... 70		20	110	150
		80	260	270
Continent	50	*nil*	40	30
Total tons ...	420	80	300	300

At auction on Wednesday offerings were restricted to 94 bags 5 cases Singapore and 45 bags Siam, and these retired unsold.

The closing report was:—

Pepper firm. Of Black, no sales reported; $\frac{5}{32}$d. buyers Singapore October-December shipment.

Of White, 50 tons sold, viz., Singapore near at hand at $8\frac{3}{8}$d., and Pe December-January shipment at 7 $\frac{15}{16}$d.

Zanzibar Cloves dull for delivery. 300 bales October-December s ment sold at $4\frac{5}{32}$d. c.i.f. (Rotterdam).

October-December delivery sold at $4\frac{3}{16}$d. and sellers.

GINGER.

Cochin.—A decided lull has followed the activity of the past two w and not much business has been done since our last issue. Buyers naturally utilised the quietness to bring about a lower range of va and have succeeded to the extent, say, of 1s. per cwt. on washed. auctions embraced 88 cases 992 bags, of which 69 cases 280 bags so the room as follows: medium rather roughly cut and scarped 58s. med part boldish, roughly cut and scarped Native, limed 44s. 6d. small and ditto 33s.; bold branchy brown rough Calicut (in cases) 42s. 6d.; brown rough Calicut Sorts 23s. 6d; good medium and small washed Co rough 24s. shrivelled pickings 17s. per cwt.

SULPHATE OF QUININE.

Slow of sale at $9\frac{1}{2}$d B & S or HB from second hands.

TEA.

CHINA.—London advices, dated 2nd September, state:—The pri market has had very few orders to fill for Congous this week, and feeling all round is one of decided lassitude. At public sale the has been very slow and Packlings and new make Congous went in bu favour, other makes exhibiting no change in value.

Since our last 6,559 packages have been brought to the hammer partly sold as follows:—

half-chests new Black leaf Congou partly sold, medium $6\frac{1}{2}$d.
ditto Ditto Siftings sold at $2\frac{3}{4}$d to $3\frac{1}{4}$d.
ditto new Red leaf Congou 5d.
ditto old Ditto Panyong $5\frac{1}{2}$d.
boxes new Pakling Congou 5d to $6\frac{1}{4}$d.
ditto new season's new make Congou $4\frac{3}{4}$d to 6d.
boxes Canton Scented Caper, common to fair $3\frac{7}{8}$d to 5d, mediu good 6d to $8\frac{1}{4}$d.
ditto Scented Orange Pekoe $7\frac{3}{4}$d to $10\frac{1}{2}$d.
half chests and cases Moyune Green Gunpowder, medium to goo to 9d, fine 10d to 1s $0\frac{1}{4}$d; Imperial $6\frac{1}{2}$d; Young Hyson, good me 7d to $7\frac{1}{4}$d, fine Sow Mee 1s to 1s 1d; Hyson good to fine Foong 9d to $10\frac{1}{4}$d.
half-chests Pouchong 7d.

INDIAN.—Public auctions were rather smaller, amounting to 30 packages, compared with 34,300 packages last week and 33,100 pack a year ago.

Not much alteration was apparent, most of the offerings meeting a fair demand. Fine teas again received good attention at fully fo rates, but common and medium sold rather irregularly, with how somewhat more enquiry for all useful parcels. Pekoe Souchongs Pekoes from $5\frac{1}{2}$d to 7d per lb. possessing fair cup show very good v at present, and should go rapidly into consumption.

For 23,600 packages on Garden account $9\frac{1}{4}$d per lb. was obtai contrasted with 10d per lb. for 23,100 packages, and $10\frac{1}{4}$d per lb. 25,600 packages in the two seasons before.

The number of packages printed in August was:—

1898.	1897.	1896.
121,900 pkgs.	100,300 pkgs.	131,400 pkgs.

The London Bonded Warehouse statistics for August are:—

	IMPORTS. August.	DELIVERIES. August.	STOCK. 31st August.
1898 ...	13,351,000 lb.	10,378,000 lb.	28,206,000 lb.
1897 ...	12,480,000 ,,	8,312,000 ,,	25,802,000 ,,
1896 ...	12,649,000 ,,	8,155,000 ,,	22,808,000 ,,

CEYLON.—Sales comprised 29,400 packages, against 29,700 package the 23rd ult., and 26,300 packages in 1897.

The better tone noticed previously continued, and there was b bidding for nearly all descriptions at firm to occasionally better pr though quotations for Broken Pekoes often marked variation.

The average is $7\frac{7}{8}$d per lb. On the Tuesday before it was $7\frac{3}{4}$d pe and also on the 2nd September, 1897.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Re dated August 26th, 1898, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899...	186,261 packages.	311,578 packages.	9,987 packs
18 97-1898...	169,124 ,,	344,662 ,,	11,357

34,983 *pkgs.* INDIAN
30,014 „ CEYLON
1,642 „ JAVA
} Total 66,639 packages were offered in public auction this week.

The total quantity of British Grown Tea sent to North America during the past six months amounted to lb. 6,245,443, against lb. 6,580,336 during the same period of 1897, but there was a heavy import during the first quarter of 1897, caused mainly by an expected advance in the Duty.

Indian. Now that Indian Teas are beginning to arrive in quantity, the week's auctions afford a better test of the actual state of the market, and it is satisfactory to find that Teas with really good quality continue to command high prices with a strong market, viz.:—"Poobong," 2/4¼; "Ass. Fron. T Co. Sookrating," 2/–; "Margaret's Hope," 1/10¼; "Budla Beta" and "Castleton," 1/6¾. Medium and poor liquoring descriptions met with less active demand, and prices were somewhat irregular with a cheaper tendency.

Total Tea sold on Garden Account 1st June to date 1898, 111,305 pkgs. av. 8·66d. 1897, 109,821 pkgs., av. 9·12d.

Ceylon. Although the auction was again comparatively heavy, bidding for all descriptions was animated and the market steady. Teas for price were wanted and sold at rates which were a shade dearer. The better quotations lately ruling for good liquoring Teas were also fully maintained, medium descriptions with poor quality not meeting with such marked attention. Average for week 7·68*d.*, against 7½*d.* same period last year. The following averages may be mentioned:—"Diyanilakelle," 1/1; "Cranley," 1/0¾; "St. Co. St. Leonards" and "Talawakelle," 1/0¼.

Ceylon Tea sold on Garden Account 1st Jan. to date 1898, 762,777 pkgs., av. 7·60d. 1897, 755,273 pkgs., av. 7·61d.

Java. The Javas consisted of Teas saved from the recent fire at Hay's Wharf.

Bank Rate 2½ per cent. Exchange on London three months sight:—Calcutta 1/4. Colombo 1/4.

TEA IN AMERICA.

The American Grocer reports under date *New York, August* 10.—The prices obtained at the auction sale last Wednesday indicated a well sustained market. Since then demand has been very light.

New York, August 17.—Since the auction sale invoice trading has been very light, the market ruling steady at prices established at the auction.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, ght Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including stage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. r line for the first, 3 as. for the second, and 2 as. for the third and succeeding sertions. Five-line (or shorter) advertisements from Subscribers will be serted for three issues for one rupee; non-Subscribers will be charged two pees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic currence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duff & Co., Proprietors, Planting Opinion," 16/17, Armenian Street, Madras.

IMPORTANT NOTICE.

The Offices of this paper having now been removed o Madras, all remittances should be made payable to . C. Duff & Co., Proprietors, *Planting Opinion*, 16 and 17, rmenian Street, Madras, who will also attend to all dvertisements, &c.

Letters to the Editor should also be addressed to the adras Office.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 7th October, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Kadur.

Belur, 27*th Sept.*—*Weather.*—Fine with N.-E. showers in the evening. Very heavy fall at 2-20 on the 26th. *Crops.*—Planting has been going on with Claridge's patent transplanter, which is found to work satisfactorily where the soil is not sandy. *Diseases.*—Black rot has come and gone, and has been followed up by leaf-disease, badly on most estates. *Interesting Items.*—The race meeting at Chickmaglur is on from 26th September to 2nd October. The usual Volunteer Inspection, cricket match and theatricals, kindly got up by the Deputy Commissioner, will take place during the week. *Health.*—Good. *Labour.*—Plentiful.

Kil Kotagiri.

22*nd Sept.*—*Weather.*—Monsoonish, light rain nearly every day. *Plant-diseases.*—Leaf-disease showing up every here and there, but not really bad anywhere. *Clearings.*—This weather suits the new clearings better than the old coffee. We want a couple of weeks fine now to ripen up the crops. Picking has started everywhere now, but not heavily; about the 15th October will bring us into really full swing. *Labour* decreasing, but still plenty for all works. *Health.*—Fair, a few coolies down with fever. *Interesting Item.*—A tiger has killed several cattle and a pony here during the last week.

Mudigere.

South Mysore, 24*th Sept.*—*Weather.*—August was the lightest August on record, but not bright. First fortnight in September was gloomy and rainy, but now we have usual weather for the season, bright sun and occasional rain. We have had over 10 inches, which is quite up to the whole average for September. *Crops.*—On the whole estimates seem to be rising—rather a dangerous tendency at this season, when crop always looks at its best; but as far as I can see, there is better justification for it than usual. *Disease, etc.*—Black rot has been worse than usual owing to the gloomy character of the monsoon, but it is mostly "shuck" trees that have been attacked. There cannot have been much serious loss, or we should not have the general confidence there seems to be

that, in spite of bad blossom showers, fair crops will be picked, though there are only a few bumpers. Leaf-disease, like the poor, is always with us in this month, but it does not appear to be serious anywhere. A few overladen trees have been shaken, and a few bad patches (waterlogged, &c.) look rather bad. Coffee generally, under proper circumstances, looks as well as I have ever seen it. Even supplies which, as a rule, are the bane of a planter's life, from the anxiety they give him, seem to have a wavering inclination to live and grow. Very often there is no wavering at all, for the most paltry excuses they die right away. Although a few have rejected them, basket plants seem to be growing in favour, but it is now generally recognized that they should be planted out very early or very late, either in May or in October or September at the earliest. *Labour Supply* seems to be irregular, but generally sufficient. Petty native planters are straining every nerve to pay their coolies and keep them, but as a rule the sowcar's purse-strings are tightly knotted, and nothing in the way of advances can be extracted. How these men would curse the Government of India if they only knew. The speech of the Mulnaad is free and fluent. When they fail to pay their coolies, there will probably be a rush of more than we can find work for. *Health* is at present good, but Chickmaglur is to be watched for the issue of the cholera we have had from there for two years past. *Grain.*—Prices remain much about the same. Ragi dear, gram very dear, paddy normal. Rather contradictory reports come in about crops this year, so probably they will be irregular, and therefore somewhat short on the whole.

NEW MARKETS FOR TEA.

South India has still a good deal to learn from Ceylon in regard to the opening out of new markets, and the vigorous development of trade with those with which trade has already been begun. In regard to this, the recent proceedings of the "Thirty Committee" in Ceylon contain information that should be noted by South Indian planters, few among whom have taken an active part in even the insufficient attempts made by the Indian Tea Association along similar lines to those followed by the planters of Ceylon. Glancing over these proceedings, we find entries of "Ceylon Tea in America," in Canada, in Russia, in Germany, and so on. Now what communication has South India with these markets? It would be interesting to learn how much tea is shipped from South Indian ports to the United States, Canada, Russia, Germany, France, Belgium, Austria-Hungary, Holland, South Africa and Burma. Our insular neighbours appear to have direct connection with all these countries. Have South Indian planters? If we err in replying to this with a brief negative, some of our friends will no doubt set us right. To the above list we would add Australia. It is not our intention to suggest that *no* South Indian tea is shipped to this market and the others just named; but we wish to emphasize the fact that direct business with these countries is not being pushed. It is equally true, we believe, that planters in these parts are, as a rule, ignorant of the consumption and the requirements of most of the foreign markets now mentioned, whereas Ceylon would seem to have a good deal of valuable information on the subject. In addition to this, Ceylon has representatives hard at work in various parts of the world canvassing for Ceylon Tea. Its virtues are being preached far and wide. Apostles have been sent forth, and no doubt the response comes in the shape of improved demand, which, if it does not always mean an advance in prices, at least checks or prevents the fall that would otherwise follow upon steady increase of production that has been noticeab late years.

As regards the United States, the broad plan of Cey action is sufficiently well known to require little com here. The details of advertisement, etc., are ever var with a view to catch the popular fancy. That real goo been done, is beyond question. In Canada, we believe, a sober method has been followed, but the fruits thereof not yet been revealed to us. Proposals for advert more freely in Russia are now under consideration. Germany, Hagenbeck's Tea-House and Exhibition is ha a gay time, and evidently something has been achieve fair promise has become visible, for the "Thirty Commit has recommended the appropriation of £1,000 to adve ing and pushing Ceylon Tea in Germany, a sp grant of 5,000 lb. Ceylon Tea to be sent to Berlin fo tribution among German requirements, and the prese a special chest to the Kaiser. Besides this, a grant of £50 made some time ago towards advertising Ceylon Tea making it known on the Continent of Europe. In re to Belgium, Holland, and South Africa, the "Thirty mittee" has resolved that £100 be allotted in each case certain firm or individual on their sending accounts vouchers showing an expenditure of £300 sterling copies of newspapers with the advertisements ins therein. That is to say, the Committee is prepare make grants-in aid. Then, too, the Paris Exhibition serve as an advertising opportunity, and the Committ of opinion that Ceylon Tea should be represented at Coolgardie Exhibition of 1899 (The Western Austr International Mining and Industrial Exhibition). Add t the recent bonus of 10 cents a lb. offered in respect to g tea, and it will be seen that Ceylon avails itself of opp nities, seeks them, and even makes them, to push its te all sorts of places. If in the meantime South India no corresponding measures, what must be the inevi result? If it were possible to think that what Ceylon sp on advertising and popularising its tea, South India *into* hers, in the form of improved quality, we might that the latter course would yet prove the more suc ful. But there is no room for this hope.

Naturally, discrimination should be exercised in the s tion of markets whose trade should be sought by a measures. It has been stated recently that the cons tion of tea in France is extremely small. To oust C and substitute Tea would be the work of a lifetime one on which wise men would scarcely spend much m The Germans also take but little tea, the average a consumption per head of population being only one-se of a pound, and the total consumption in 1896 6,000,000 lb. The Russians use less than ½ lb. per but the total amounts to nearly 80,000,000, of which than half still enters the country by trans-frontier r This means that the bulk of the trade is still in the of the Chinese. In 1895 the United States imp 55,000,000 lb. from China, 37,000,000 from Japan, and 865 lb. from all other countries in Asia. Of c the position in Russia and America has changed g since these figures were compiled, but though India Ceylon are gaining ground, China still accounts f largest portion of the trade. Partly owing to changes fiscal policy of the Government, imports into the U

ates jumped up to nearly 113,000,000 lb. in 1897, but the al import of Ceylon and Indian into North America(includ- Canada) during the first half of 1897 was about 6½ milli- s, and in the corresponding half of this year only about millions. In Australia, where the consumption of Tea r head of population is higher even than in the United ngdom, China also has a lead. It would seem, how- er, that America, Australia and Russia offer the best lds for the canvasser who wants quick results. If e planter is prepared to advertise for the benefit of sterity, he may do some good by pushing his teas in France; t in America and Australasia and Russia he may hope reap for himself the fruits of his labour and his expendi- re. It is to these markets, therefore, that we would ecially direct the attention of our readers, and it may be ll to remind them that *combined* effort is essential to ccess in matters of this kind. To advertise a particular and is useless; what is needed is that *Indian* (or we ght perhaps say *South Indian* tea) should be pushed in position to China and Ceylon growths. Price and merit ll in the long run decide the result of the competi- n, as long as all are in the running; but if Ceylon is owed to enter against China alone, India must inevit- ly fail to win, for want of effort. It would be well if uth Indian planters would discuss the question of fertilis- *demand*. Markets need fostering just as plants need trition.

CINCHONA.

In Java.

Java produces about two-thirds of the world's supply of nchona Bark, so that the manner in which her stocks are t on the market is of considerable interest to Cinchona nters in other parts of the world. For years, until about 96, the Java bark was regularly shipped to Holland, and ere sold at public auction. The large Quinine manufactories, stly situated in Germany, were the chief buyers; and for me years they combined to keep Cinchona prices at such ow level that the cultivation of the bark was unprofitable, d the extra gain thus made helped to swell the dividends the manufactories at the expense of the planters. It was, erefore, decided—in 1895 or 1896, we think—to establish a ctory in Java. This was erected at Bandoeng in the eangar Regencies, and the first product was delivered in 96. The quality was said to be first-rate and in all pects equal to the best European brands. During the ly part of 1897 some of the planters were tempted to p their bark to Europe rather than to consign it to the va factory, in view of the important rise which took ce in Europe about the time that the Bandoeng factory s started. It was clear enough that this rise was brought out by buyers for the deliberate purpose of diverting pplies from the Java factory to Europe, and thus nging about the downfall of the former. After a time, nters seemed to see this, and last year they afforded the al factory good support, giving it a considerable share of ir bark for manipulation. It was, therefore, confidently pected that the Bandoeng enterprise would be a success. cent news points, however, to a change of feeling on the rt of the planters, who are again being influenced by the ctics of buyers in Europe, and possibly by a change of system at the factory. The Manager of this undoubtedly aimed at co-operation with planters, but the co-operative principles he introduced did not give general satisfaction. Many planters objected to the condition that the quinine should be consigned to a firm appointed solely by the works, without consulting the planters. The almost general opinion was that the bark should be purchased for cash by the works, instead of paying a fixed manufacturing charge and a percentage of the net proceeds of the quinine. It was also found more profitable to sell the bark at the Amsterdam auctions than to forward it to the Bandoeng works. The result was that not one single planter accepted the terms of the agreement. A revised scheme was then put forward, the Manager of the factory formulating the proposal that three-fourths of the usual annual production of Java bark should be exported to Europe, and the remaining fourth be manufactured in Java for consumption in Asia and Australia. This would have necessitated the extension of the Bandoeng works, as one-fourth of the ordinary yearly production represents double the quantity of quinine that can be manufactured at present at Bandoeng. But this also failed. Further details may be found in an article on "The Java Quinine Factory," published on another page, which reached us after the above was in type.

The object of European manufacturers is considered to be the extinction of Java competition, and they may succeed in this by temporarily increasing the price of the bark, so that the planters will find it more profitable to export their produce, when naturally the Bandoeng works would stand idle and soon come to grief. At the present moment the chances seem to be against the Java factory—a fact that is largely attributable to a want of foresight on the part of Cinchona planters in that island.

In Portuguese Colonies.

The *Suddeutsche Apotheker Zeitung* says that the Portuguese colonies in West Africa which are near the German possessions, the Islands of St. Thomé and Principe, and the larger region of Angola have long been regarded as models of agriculture, and some notes on Cinchona cultivation by H. T. Moller, who was formerly in St. Thomé, are specially noteworthy from this point of view also. It was in 1864, on the recommendation of Weltwitsch, that the first Cinchona plantation was attempted in St. Thome. Unfortunately, the almost valueless *Cinchona Pahudiana* was planted. In the years 1869-71 there were received from the Botanic Gardens at Coimbra several plants of *Cinchona succirubra* and *Cinchona Condaminea* (*C.*

Colombo.

officinalis), which, however, received but little notice until 1885, when the grave crisis in the coffee trade of these colonies forced public attention to them. Requests were quickly made to Coimbra for plants and seeds of *C. succirubra, C. calisaya, C. Ledgeriana,* and several other species. Extensive plantations were made, large forests being destroyed for the purpose. From 1880 to 1887 about 1,600,000 trees were established in St. Thomé. In the chemical laboratory of the University of Coimbra a large number of analyses of the bark were made, and the bark was, it is said, found to be as rich in alkaloids as the best bark of America, India, Java and Ceylon. For some years several of the largest planters have managed a quinine factory in the neighbourhood of Lissabon, which prepares quinine of a very high standard of purity.

SHADE.

(From a South Mysore Correspondent.)

"Tempora mutantur, nos et mutamur in illis."

This is very true regarding the methods of cultivating coffee, and to no department does it apply more aptly than to shade. It is true that several classes of shade trees remain permanently in favour, such as the Utti (*Ficus glomerata*), Cub Busri (*Ficus tuberculata*), Kurri Busri (*Ficus infectoria*), Goni (*Ficus Mysorensis*), and the Halsin, the Jak (*Artocarpus integrifolia*). Some of these are perhaps too dense where rainfall is heavy; but they all agree excellently with coffee, and the reason that they are not solely resorted to is with regard to the Busris and Goni difficulty of propagation and slowness of growth, and with regard to the Utti the fondness cattle and game show for it. There is the same objection to the Jak, but there are others of a more serious character. It is subject to a parasite which sometimes kills it, and frequently causes the branches to die back, thus depriving the tree of its fine spread. Cattle, too, love the fruit, and when it is ripe and falls to the ground, barbed wire won't keep them out. For these reasons the above-mentioned and other first-class shade trees have not had an entire monopoly, and planters have had recourse to others which they hoped would equally fulfil their requirements. Throughout Mysore during the past twenty years lacs of Howligays (*Acrocarpus flaxinifolius*) and Gana Gurrigays (*Cedrela toona*) have been put down. It was expected that the Howligay when first planted would be permanently suitable, but later on it was found that where rainfall was light it was sufficiently dense, and it was then, being of rapid gro planted with the idea of quickly getting up a covering of cutting it out when better shade had come on. Fur experience proved, however, that there were fatal object to it. It was discovered that the scale which invad not infrequently killed the tree, and that the saccha deposit with which the coffee trees in its vicinity bec covered seriously affected the bud. A more disast effect still has recently been revealed, and this is that dead stump of the Howligay causes a group of coffee t to die around it, to which Mr. Graham Anderson drew at tion at the U.P.A. Meeting. The smaller stumps do appear to have this effect, but those 9″ in diameter larger, or say those ten years old and more, cause de results. The only remedy is digging them out, so t estates where Howligays were planted thickly are put to double expense of cutting them down and uprooting stumps; the consequence is that these trees are now rega in an unfavourable light, and few are planted out. The G Gurrigay, though not so objectionable as the Howliga now scarcely considered first-class shade. It appears t best in land to which it is indigenous. The fact that somewhat late in assuming its new foliage, thus affor little shade in January and February, is a drawback t but a more serious evil is the scale to which it is sub which frequently kills it, and sometimes the coffee und An opinion also prevails that coffee does not crop well, that leaf-disease flourishes, under it. The result is t like the Howligay, it is going out of fashion. Of late y *Grevillea robusta, Albizzia molucana* and *Erythrina l sperma* have been the rage. The idea of putting d either the first or last named would have been ridic ten years ago, and makes one wonder whether Casuar and Gold Mohurs will be the shade of the future! regards Silver Oaks, they have not been tried sufficie long in Mysore to test their efficacy. Their scanty spr necessitating in a climate where dense shade is essent large number to the acre, is against them, and the cont ous leaf-fall, valuable from a manurial point of view, ma found to aggravate leaf-rot. The young sapling is troublesome in the monsoon, as the combined effects of w and rain put it on its beam ends, where it remains t receives attention. I find the best plan is to lop off the foliage from a height of four or five feet right up to top, leaving the extreme end untouched, as it is the we of water it carries that causes it to fall. Treated thus foliage soon grows again, and the tree meanwhile t firmer root.

I hear complaints already that coffee does not thrive u *Albizzias,* which are very rapid growth. They closely re ble a tree known in Mysore as the Whatlucki (this, I beli has not been classified), which is found to be good for sh only in deep soils.

Lastly, I will say a few words of the much-advert *Erythrina lithosperma.* As shade I do not believe it ever be valuable; the fact that it sheds its leaves in hot weather and remains bare for a month or more, that it has such a poor spread condemn it. As regard manurial value, I am not prepared to give an opinion, experiments have been made in this district, and I h results will be forthcoming by and bye. I doubt very m whether *Lithosperma* is superior to *Indica,* and that it

R. J. HARRIS,

QUOTATIONS ON APPLICATION.
[Fy.—28-1-99.]

rnless variety is a myth. The seed which I obtained from encottah produced a delightful mixture of thorny and rnless plants.

t is perfectly true that the times change, and we change h them, and what direction our shade policy will next e I will not be rash enough to predict; but I firmly ieve if we stuck to our old friends, the figs and jaks, we uld be saved a deal of anxiety and a deal of labour and pense.

NOTES.

e Price of Cinchona. The latest telegraphic quotation from England is $\frac{7}{8}d.$ per unit.

den Tips. At the Ceylon Tea Sales on 21st ultimo, a box containing 7lb. Golden ps was sold at Rs.5·80 per lb.

e Colombo Tea Sales. On 21st ultimo the offerings met with fair competition for all good uoring teas. Common and undesirable sorts were ghtly weaker. The catalogue for 28th idem comprised 3,694lb.

Vhat Might Have Been!" Yet again a Ceylon correspondent, writing from Keslanda, comments on the short water-supply and exims: "A fine year for coffee, and those that have taken re of what they had left will reap their reward."

e Calcutta Tea Sales. The average at the Calcutta Tea Sales of 16th ultimo was As.5 pies. About 19,000 packages were to be offered on 23rd em. On the 23rd idem 17,500 packages were sold. A tter tone prevailed, and bidding was brisk for all kinds, cept commonest pekoes. There was again a very strong arket for souchongs for price.

dian Tea Estimates. At a meeting held on 5th ultimo, the General Committee of the Indian a Association gave a revised estimate of the present ason's crop of Indian Teas, showing approximately a tal of 154,167,877lb. as against the original estimate of 8,681,312lb. These are not the figures of the Committee, t are worked out from the incomplete figures they put rward in consequence of various firms and others having led to supply the information required.

uth Wynaad. The correspondent of the *Madras Mail* writes:—"The influx of capital to South Wynaad, more especially of late on the Meppady le, is a source of jubilation to local residents. One large operty having changed hands for tea, it is fervently to be ped that this is the dawning of another day of prosperity r all concerned. The coffee bushes, where first attacked 'leaf rust,' are recovering, and developing fresh liage under the salutary influence of the fine weather hich set in on the 14th instant and which promises to ntinue to the end of the month. Very little coast labour s, comparatively speaking, returned since the 'Onam,' d a great deal of important work is in abeyance, but me few Canarese arrivals are reported."

The London Tea Market. Telegraphing on 21st ultimo, Reuter reported that the tone of the London Tea Market was strong, and that there was a good demand for all kinds at fully previous rates. Messrs. Gow, Wilson and Stanton reported by wire to Colombo on 22nd ultimo that the quality of Ceylon offerings generally was improving, and that good liquoring Broken Pekoes were wanted. The market for poor liquoring sorts was steady, and prices quoted were $6\frac{1}{2}d.$ for fair liquoring Ceylon Pekoe Souchong and $8\frac{1}{4}d.$ average for the week. On the same day Reuter gave $8\frac{7}{8}d.$ (a reduction of $\frac{7}{8}d.$) as the average for Indian Tea, $8\frac{1}{2}d.$ ($\frac{1}{4}$ up) as the average of Ceylon, and stated that out of 22,000 packages of Ceylon offered 21,000 had been sold; while 37,000 Indian had been sold out of 39,000 offered.

India *vs.* Ceylon. Mr. S. Elwood May writes from New York to the *Ceylon Observer* in very indignant strain. He says:—"My idea is to push Ceylon tea in this market against China, Japan, India, *and all* others, and this I have always done. I am not able to see how the planters of Ceylon are benefited when their money is used to push Indian Tea where their own product can be placed. To be frank, some one has been a traitor to the cause. I travelled last season about 6,000 miles after new clients with great success. What happened after that—some one used money to have Bhud, Tiffin and Bungalow thrown out of the many shops I had won over, and had placed in these shops a packet tea marked 'India and Ceylon.' This kind of work has been going on for the last three years."

Coffee in Queensland. Mr. E. Cowley, Manager of the Kamerunga State Nursery at Cairns, Queensland, writes in the *Queensland Agricultural Journal:* "At 6 feet by 6 feet apart an acre will contain 1,201 trees. Allowing 3lb. of clean marketable coffee to each tree, we get 3,603lb. per acre. At the above calculation of about 5lb. of berry to 1lb. of clean coffee, this would mean that 18,015lb. of berry would have to be picked. The cost of the labour for picking at $\frac{1}{2}d.$ per lb. would reach £37-10-7½, and the value of the commercial bean produced £135-2-3, from which we deduct picking expense, leaving £97-11-7½, from which all the above-mentioned items have to be deducted." He then adds the significant warning: "As, however, paper calculations rarely are borne out by practical results, a considerable reduction may doubtless be made on the figures denoting returns."

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton:—

61·50	lbs.	Nitrogen.
57·38	„	Potash.
14·92	„	Lime.
13·68	„	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

Tea Seed. Mr. Acworth's remarks about the falling off in demand for Tea Seed are indorsed by a Cachar correspondent, who thinks that though there will be a failure in the Tea Seed Crop this year, the demand is not likely to exceed the supply. Now, if the failure is in quantity alone, and the quality is good, planters ought certainly not to hold off buying. If the quality of Indian Tea is to be maintained—not to speak of improvement—there must be new seed, and what we may term *foreign* seed used. The advice lately given to Coffee planters by Mr. John Cameron contains a lesson for Tea planters also. They may go back, they may go forward, they *cannot stand still* in regard to this question of quality. The wise will know how to act, and will not be scared by temporary depression into a course that could only tend to eventually intensify that depression.

Mexico. Not only does this country offer a good field for the cultivation of coffee, but cacao, rubber, sugarcane, tobacco, vanilla, cardamoms and ginger are all on the list of products, though some of them apparently grow wild, rather than under cultivation. Vanilla, it is remarked, "might be grown on the shade trees amongst the coffee." [Has this plan been tried in South India?] Mexico seems likely to be boomed as the happy planting ground of the future. Mr. E. O. Darley states:—"The low price of silver has not affected us planters at all to our detriment, for excepting machinery and some tools everything we need is produced in Mexico and we sell our produce for gold. With our Banks declaring annual dividends of from 16 to 20 per cent. and cotton mills from 20 to 55 per cent., and other enterprises equally as good, I hardly think that either the planter or the manufacturer has much to complain of in this country."

Mark Tapley in Ceylon. A Ceylon planter has seen a good many complaints about "hard times," "high exchange," &c., but he wonders how many "thank a far-seeing Providence for these same ills?" "Just fancy," he exclaims, "the thousands of acres that would have been opened up in tea, had not the enterprise received this slight check. A few more million lb. of tea added to our present outturn,—and where would we be? It would have meant greater depression; would it not? Now people will open their eyes and say to themselves: 'Tea is getting over-done; I am going in for cocoanuts or some other product,'—and thus save us all from our greatest enemy—*Over-production.*" There is much to be said for this view of the situation: it is at least a comforting one. But it approaches nearer to Fatalism than to Progress, and Ceylon Tea would hardly prosper if all its votaries were to view matters from the same standpoint as the above writer. It would scarcely surprise us, however, to find that he had himself done a good deal to bring about the over-production he deprecates! Even planters sometimes preach what they do not practise.

Coffee in Costa Rica. An *ex*-Ceylon planter writes to say that there is in Costa Rica magnificent coffee land in an excellent climate where even a sun-hat is unnecessary, and good shooting and fishing. He considers that a young man (who must have at least £3,000 to start with, by the way) could go to work very gradually perhaps with half-a dozen or a dozen labourers and p say 50 acres, that is at 300 trees an acre, 15,000 t which in four years would give him a clear income of to £1,000 a year and go on doing so longer than he requ an income. He adds:—"The Serapiqui Company w deal liberally in selling land, supplying plants, and in curing the coffee. Mr. R. P. Macfarlane said after return:—'If I were a young man again I would not h tate to go off to Costa Rica at once.' Mr. Huntley Th has been the means of two young men already going £3,000 is the least I should recommend a man to go the command of; but of course he does not want it a once, and he must not be afraid of work and of rough it at first. Every coffee plant he puts in with his hands or any other hands will, four years after it is pu bring him in a clear income of a shilling per annum life. Surely it is worth doing where there is no ris climatic danger."

The Nyassaland Coffee Co., Ld. At a general meeting of sh holders held at Colombo on ultimo, a report was adopted sh ing 633 acres under cultivation, 2,843 acres rese Rs.63,742·30 absorbed in developing the Company's perty, and a balance in hand of Rs.28,537·74, which cover the expenditure for the current season. During financial year under review 383 acres were felled, cle and planted, but owing to scarcity of labour and he growth of weeds due to an abnormal rainfall, the clear have not been a success, and will require much supply The scarcity of labour has been occasioned by disturba in the districts from which labour is recruited, but th having now been suppressed and the natives pacified, Superintendent anticipates that he will not experie further difficulty in this direction. A crop of some th or four tons may be secured this year, but it is left to discretion of the Superintendent as to whether it is advis to allow the trees to bear any crop or not. Store buildi and machinery will have to be erected in season 1899-19 but the crop of that season should more than provide these and ordinary working expenditure. Prices of Nya land coffee have been well maintained notwithstanding general fall in price of coffee, but even if no money ha be borrowed by this Company, it will be some three ye before the shareholders can hope for a dividend.

LETTERS TO THE EDITOR.

THE LADY-BIRD.

SIR,—I was rather surprised on reading in *Planting Opin* of September 24th, the ideas regarding lady-birds. Newport states, "as far as the Wardian cases go, I underst that the lady-birds in these cases are alive, and, if they are al they have to be fed on living scale pests."

Now the question is, what is the food of the lady-birds? one day I was talking to a planter from Hawaii about lady-bird and scale, and I remarked that it was not clear the lady-bird was to destroy the scale pest, for one da watched the proceedings of a lady-bird attacking an aphis a pear branch, and the lady-bird took half an hour to disp of one aphis, and there were hundreds on one branch. To my friend from Hawaii replied, "Oh, it is not the lady-bird t eats the scale, but the larvæ of the lady-bird, and when all scale was taken off, they died for want of scale!!"

OLD PLANTE

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

[UNDER THE CONTROL OF THE SECRETARY, U.P.A.S.I.]

FROM reports of proceedings of the Indian Tea Associa- in Calcutta, it appears that consideration has been en to letter of 16th August from the Secretary of the ited Planters' Association of Southern India, submitting, the opinion of the Committee, copy of a resolution ssed at their annual General Meeting of 9th idem on the bject of the reduction of the British tea duty, which read follows: That this Association, through its representa- es, Messrs. Sanderson and Mangles, press upon the dian Tea Association in London the urgent necessity for ducing Government to reduce the import duty on tea in eat Britain, and suggest that a strong representation ould be made in conjunction with the Ceylon Tea Associ- on in London. The Secretary was ordered to acknowledge e letter, and inform that Association that the Committee re in accord with the terms of the resolution, and to orm the London Association of the fact.

Certain confidential papers on the above subject from the anters' Association of Ceylon have been circulated to embers of the U.P.A. Committee.

The Book of Proceedings 1898 should be ready within a w days. The price, it may be mentioned, is Rs.2 per copy.

Orders by post-card are coming in, but in some cases the ank left for the number of copies is not filled up. In ery such instance *one* copy will be sent.

"PLUCKING FINE."

A PLANTER, writing to the *Pioneer* on tea prospects, remarks:— Up to the present year medium leaf would pass muster and pay for manufacture. Now there is so much tea made that medium leaf ll make about an average of 5 annas, which barely pays expenses. nd so for a time those who wish to pay expenses (let alone making profit) *must not* pluck medium leaf. Any tea that will *pay* this ar (of 1898) must be strictly of two leaves and the bud. Admitting is to be true, the bulk of planters will give up all hope of making pay. It was not until I gave up hope myself (some four years o) that I found out the way to make my garden pay. I got sperate, I 'plucked fine,' and I succeeded. But I had to heave erboard my old prejudices, founded (as I said above) on my own perience of twenty years, and the universal custom of the planters."

CEYLON TEA IN AMERICA.

SINCE January 1st, 1898, there has been a large increase in the shipments of Ceylon tea direct to America. From January 1st to July 5th, 1898, the exports were 1,188,530 pounds, against 461,795 pounds for the same time in 1897. This is a very suggestive record, and indicates the growing popularity in this country of machine-made tea. A more remarkable increase is shown by the exports from Ceylon to Russia, which were 1,198,555 pounds this year, against 176,257 pounds last year.

Push and publicity are doing much for the tea planters of Ceylon, and the more vigorous and persistent their campaign, the more gratifying will be their record of direct shipments to America and Russia.—*American Grocer.*

THE CURRENCY QUESTION.

PRICES OF FOODSTUFF.

THE REV. A. ANDREW, of Chingleput, criticises Mr. Acworth's evidence concerning prices of articles that the ryot in India has to pay, and the remark "that in our hills the prices of grain have kept steady, but if you take rice that is sent down to the Coast, the price has risen enormously." Mr. Andrew says:—

I have not the statistics for food-grains for the Planting Districts in Mysore and Travancore, but I have them for the Nilgiris, where there is a very large planting community, and for the other districts of the Madras Presidency. These statistics, which are wholly derived from Government records, do not support Mr. Acworth. Indeed, it is difficult to know precisely what he means by the sentence quoted. The following table shows the price of rice (common sort), indicating the average number of seers of 80 tolas each to the rupee between 1883-84 and 1897-98, for the Nilgiris and the Presidency.

Year.	Average seers per rupee.		Year.	Average seeres per rupee.	
	Nil-giris.	Presi-dency.		Nil-giris.	Presi-dency.
1883-84 ...	12·0	16·0	1891-92 ...	8·3	10·6
1884-85 ...	10·7	13·9	1892-93 ...	8·7	10·7
1885-86 ...	10·8	13·9	1893-94 ...	8·9	12·1
1886-87 ...	11·7	15·2	1894-95 ...	9·5	12·7
1887-88 ...	11·9	15·8	1895-96 ...	9·7	13·2
1888-89 ...	11·2	14·3	1896-97 ...	8·8	11·2
1889-90 ...	10·4	13·1	1897-98 ...	7·8	9·5
1890-91 ...	9·7	12·6			

It will be observed that the price of rice in the Nilgiris has risen considerably during the past 15 years; and the presumption is that a similar rise has taken place in the other South Indian Planting Districts. Comparing the average prices for the Nilgiris in 1883-84 with those of 1897-98, it is found that a rise has taken place to the extent of 56·4 per cent.

Whatever be the experience gained in the other planting districts with reference to the price of rice, it is certain that a great rise has taken place in this commodity in the Nilgiris. During the same period ragi has risen in price in the Nilgiris by 58·6 per cent. It stood at 23 seers to the rupee in 1883-84 and 14·5 seers in 1897-98.

A similar rise in food-grains has taken place in the Madras Presidency. The average price of rice for all the districts was 16 seers to the rupee in 1883-84 and 9·5 seers in 1897-98, showing a rise of 68·4 per cent. But if 1896-97 be taken instead and compared with 1883-84, the rise is 42·8 per cent. Ragi, one of the other important grains, has risen 131 per cent. between 1883-84 and 1897-98, while cumbu and cholum have risen 106 and $124\frac{1}{2}$ per cent., respectively, in the same period.

Referring to the above, another correspondent writes to the *Mail*:— "Mr. Andrew has fallen into a trap for the unwary in taking as a basis of comparison the prices of 1883-84, which was about (I am speaking from memory) the cheapest year of the last quarter century, except in the case of rice, the price of which is partly

controlled by gold prices, and is not at all important to the masses, nor to the plantation coolies. Taking the rates of 1873, with an index number of 100 as a basis (and they are for various reasons a very fair starting point), prices in this Presidency have been much as follows:—

Grains.	1880-81 to 1883-84.	1889-90 to 1893-94.	1894-95.	1895-96.
Rice	... 97	131	123	118
Ragi	... 86	128	116	103
Cholum	... 80	125	114	103
Cumbu	... 86	130	115	103

A comparison of the figures (first column) with those in the last column will show what I mean. As we all know, for the last two years prices have been altogether abnormal."

Just as contradictory are opinions elsewhere, and as for statistics —well, they are as accommodating as usual, and may be quoted to prove either of the two opposition views referred to above.

For instance, "X" recently forwarded the following to *Capital*:—

Now take a typical staple like common rice, and look for a moment at the annual average price in Bengal from 1861 to 1897:—

	Seers sold for Re.1.		Seers sold for Re.1.
1861	... 29·1	1880	... 20·61
1862	... 29·47	1881	... 26·4
1863	... 28·94	1882	... 24·85
1864	... 26·17	1883	... 20·49
1865	... 18·87	1884	... 15·5
1866	... 13·82	1885	... 15·84
1867	... 21·67	1886	... 19·92
1868	... 23·7	1887	... 21·03
1869	... 21·52	1888	... 19·01
1870	... 24·6	1889	... 14·98
1871	... 25·26	1890	... 16·29
1872	... 23·86	1891	... 15·84
1873	... 20·97	1892	... 15·31
1874	... 15·24	1893	... 12·86
1875	... 20·57	1894	... 13·92
1876	... 21·76	1895	... 16·9
1877	... 18·69	1896	... 13·41
1878	... 13·17	1897	... 9·59
1879	... 14·02		

If we take the aggregate for these decennial periods as the index, they work out as follows:—

1861-1870.	1871-1880.	1881-1890.
237·86	... 194·15	... 194·41

but if we take the aggregate for the last ten years, *i.e.*, from 1888—1897, we get the extraordinary low index figure of 148·11.

Now turn back to our exchange. We find the aggregates of the decennial periods are as follows:—

1861-1870.	1871-1880.	1881-1890.
243 41·48	... 216 23·32	... 185 45·96

but if we take the aggregate for the past ten years, *i.e.*, from 1888-1897, we get the extraordinary low index figure of 156 7·64. Arrange the statement in this way—

	Aggregate Decennial Index. 1861-1870.	Aggregate Decennial Index. 1871-1880.	Aggregate Decennial Index. 1881-1890.	Aggregate Decennial Index. 1888-1897.
Price of Rice ...	237·86	194·15	194·41	148·11
Rate of Exchange ...	243 41·48	215 23·32	185 45·96	156 7·64

Just think for a moment what this means. One rupee exchanged every year for the first ten years would have produced £1-0-4; one rupee exchanged every year for the last ten years would have produced 13s. One rupee spent in rice every year for the first ten years would have purchased nearly 238 seers of rice; one rupee spent in rice for the last ten years would have purchased 148 seers of rice, and yet writers of weight like Mr. T. Lloyd come forward and airily assert that local prices in India have not risen. The inclusion of 1897 in my calculations cannot be objected to on the score of being a famine year, for there have been frightful famines in the other years that are included. At the same time it is worth noting that in 1897 a rupee would purchase far less rice in Bengal than in any former year.

For comparison with the above, Mr. Giles F. Walker (Ce gives the following:—

PRICES OF RICE ON ST. JOHN DEL REY ESTATE, BOGAWANTALAW FROM 1866 TO 1898.

* Six months.

The connection between Exchange and prices is, it will be from the above, by no means clear, and statistics can be giv *upport* Mr. Acworth's evidence as well as to contradict it.

THE INDIAN TEA ASSOCIATION.

THE following is an abstract of part of the proceedings of a me of the General Committee of the Indian Tea Association held 5th September. There were present: Messrs. H. S. A President; A. F. Bruce, D.A. Campbell, F. H. E. Lamb, T. Trail W. Warrington.

Mr. Campbell proposed, and Mr. Bruce seconded, that Mr. Anderson be elected Chairman for the ensuing year.

Mr. Bruce proposed, and Mr. Traill seconded, that Mr. Ash elected Vice-Chairman for the ensuing year.

Both resolutions were carried unanimously.

Letters of the 13th, 22nd and 29th July and 5th August fro Secretary, Indian Tea Association, London, next came up. Committee considered the question of the local consumption referred to in the London Secretary's letter of 5th August, a suggestion put forward by a member of the London Associatio tea should be packed in small 2-oz. tins and disseminated thr

MANURES.

Fish Guano. Steamed Bone Meal. Poonacs:—Castor, Mowra, Hoongay. **Saltpetre, Crude and Refined** (Nitrate of Potash.)
itrate of Soda. Sulphate of Ammonia. Sulphate of Potash. Muriate of Potash. Superphosphates. Phosphate Powder. Kainits Salts.

Mixtures can be made in any proportion without extra charge. **Packing** can be done to suit transport by bullocks, etc.

Prices will be furnished on application for delivery either at our Karaparumba Works, Calicut, the Calicut Railway Station, Palghat, Mettapollium, lem, or at our godowns in Cochin, Tellicherry, Mangalore and other places.

Quotations will be obtained and orders booked for any Manures not kept in stock. F.r.m.

out every bazaar in India. The Committee believed that the imports of China and Ceylon teas into India for use in the country were not nearly as extensive as was apparently believed in London, as a large proportion of tea thus imported is re-exported to the Persian Gulf and other foreign markets. The Secretary was instructed to write to the Bombay Chamber of Commerce for particulars of the imports of tea from China and Ceylon, and also for the exports of tea from Bombay to Persian Gulf ports. The general question of the sale of India tea in this country was to be fully taken up at the next meeting of the Committee after consideration of the papers now in circulation.

Considered letters of the 13th, 23rd, and 29th July and 5th August from the Secretary, Indian Tea Association, London, in connection with the American Market Fund. The reference made by Mr. Blechynden at a meeting of the London Committee to samples of Green and Oolong teas sent from India and highly appeciated in America was considered by the Committee. Information was afforded by the members of the Committee as to their own experience with manufacture of Green tea, and it was stated that experiments recently made proved that it was almost impossible to produce tea at all equal to samples sent out, even with panning and hand-rolling. In addition to this the cost of manufacture was very high. The Committee had before them a most interesting circular issued by Messrs. Gow, Wilson and Stanton on the effects of high exchange and increased production on the tea industries of India and Ceylon. It was decided that this circular should be reprinted and circulated to all members of the Association for their information.

Letter of 16th August from the Secretary of the United Plan Association of Southern India, and submitting, for the opinion o Committee, copy of a resolution passed at their annual Gen Meeting of 9th idem on the subject of the reduction of the Bri tea duty which read as follows: That this Association, through representatives, Messrs. Sanderson and Mangles, press upon Indian Tea Association in London the urgent necessity for in ing Government to reduce the import duty on tea in Great Bri and suggest that a strong representation should be made in junction with the Ceylon Tea Association in London. The Secre was ordered to acknowledge the letter, and inform that Associa that the Committee were in accord with the terms of the resolu and to inform the London Association of the fact.

Considered letter of 30th August from Messrs. Bruce & Warrin handing a draft form of the proposed tea seed contract. After cussion it was decided that the contract should be submitted to Tea Traders' Association for their opinion.

Considered an article from the *Pioneer* of 1st September on "Indian Tea Industry." The Secretary was instructed to have article reprinted and circulated to all members of Association.

Considered letters, dated 25th and 26th August, from Me Andrew Yule and Co., and Messrs. Davenport and Co., respecti on the subject of the crop estimates. Both these firms expressed opinion that the issue of another estimate is unnecessary in interests of growers, and were unwilling to furnish figures of probable outturn of the gardens under their management. Committee regretted that these firms did not see their way to r

E. D. SMITH & CO., MADRAS.

the usual returns in accordance with the resolution passed at the annual General Meeting of the 18th August. The Secretary was instructed to enquire whether they could not reconsider their decision. The Secretary placed on the table telegrams from the various districts furnishing crop prospects.

A DRUGGIST'S GARDEN.

MR. T. N. CHRISTIE AT WALLINGTON.

ABOUT twelve months ago did the Manor House, Wallington, pass into the hands of Mr. Thos. Christie, who is exceedingly busy in an endeavour to bring it and the gardens into good condition. The Manor House and grounds occupy nearly 20 acres, and the land is situated between two roads, one of which leads to Hackbridge, the other to Croydon. The residence is a famous house, and parts of it are very old. Almost underneath the drawing-room even is an old Norman chapel, and quaint steps leading thereto. It is said that the first Italian roof put upon a residence in this country was that used in the case of the Manor House. There is evidence that at one time the gardens were the subject of intelligent interest, as, for instance, in the selection of the trees and shrubs, which, according to report, was the work of an Italian. Everything has since been neglected. The trees have overgrown each other, the fine, extra large, variegated Hollies and other ornamental species are either in unsuitable positions, or are hidden by less worthy specimens. A year ago there were no laws, unless a meadowlike greensward may be described as such ; there was no kitchen-garden, and the Rockery, which, in spite of its neglected condition, may be capable of improvement, was utterly overgrown with undesirable plants. Mr. Christie has done much in the direction of improvement, by attacking the most needed reformations first. There is now, therefore, a kitchen-garden, with good crops of vegetables, and young fruit-trees have been planted. There is a conventional but pretty flower-garden close to the house, and the surrounding lawn has been brought into as good a condition as the time would permit.

Walking with Mr. Christie through the vegetable-garden, we were made aware of a fact that we suspect gardens in rural districts may not know so well as their suburban *confrères*. The cabbages were protected by nets, just as were the strawberries ; and it was affirmed it is difficult to preserve the Brassicas from the voracious appetities of the wood-pigeon. Mr. Christie has for many years been a zealous Fellow of the Linnean Society ; he is also the head of a large firm of wholesale City druggist, and one department of his garden indicates that his greatest interest lies in the cultivation and distribution of economic plants. There is a good collection of these interesting plants which his special knowledge of the value of drugs has led him to acquire. Mr. Christie disposes of the plants commercially over the whole world. He must have a wide correspondence, for as we pass along the house, this plant is described as having been sent from the West Indies, that from Queensland, the other from Columbia or Japan, others from East and West Africa, and so on.

TROPICAL PLANTS.

In this way Mr. Christie acquires plants without names, but with worderful descriptions. They frequently turn out to be unimportant, no doubt, but now and again quite a new plant is flowered. Thus we were shown a new ornamental Begonia, several important Rubber-plants, and other species that may turn out to be valuable. But there is no doubt in respect of such well-known plants as the Coffeeas, Vanillas, Cocas (Erythroxylon Coca, and Theobroma Coca), which we noticed in some quantity, nor as to the Ginger (Zingiber officinale), the Pepper (Piper nigrum), the Arrow-root, &c. Piper nigrum produces the pepper of commerce, though there are many other sorts of pepper that are obtained from other genera. All pepper-corns are black, and the white form is obtained by fermenting the seeds. Black pepper has always the best flavour.

The nutmeg-tree, too, is here. It is Myristica moschata, or officinalis, and grows to 25 or 30 feet in height, being cultivated extensively in the Banda Isles, Sumatra, Java, and the Mollucca Isles. There is also a large camphor tree 9 feet high. Close to the plants which furnish all these tasteful articles was the deadly poisonous strychnos (S. nux vomica), a member of the Loganiaceous group, almost all of which are more or less poisonous. The strychnos is a native of India, grows to a moderate size, and its fruits somewhat resemble oranges. Besides being a deadly poison, nux vomica is also a valuable drug. There were many varieties of the Strophanthus that yield the heart tonic. Next we notice the

mahogany-tree (Swietenia Mahogani), but there are many kinds of mahogany from various countries, and obtained from different species of trees. Passing a species of Hibiscus in bloom in the stove, Mr. Christie observed that by a new process, yet in an experimental stage, it may be possible to utilise the full length of the fibre contained in this plant.

We next notice the cassia in bloom, the origin of the school boy's medicine—"senna." It is a yellow-flowered leguminous plant, of quite ornamental appearence. One species, C. occidentalis, of the Indies, furnishes a coffee in use by the negroes. Next is the Guaiacum officinale, which yields the Gum Guaiacum of commerce, and a very heavy wood also; Eucalyptus in several species; and the Cinnamon (Cinnamomum zeylanicum). This Lauraceous plant furnishes the best cinnamon, and is cultivated extensively for the purpose in Ceylon. Cecropia peltata, the trumpet-tree of the West Indies and tropical America, said Mr. Christie, will supersede the bamboo for many purposes; its hollow, light wood grows very quickly. A friend sent the plants from Columbia, advising that they be planted out-of-doors, stating that in that country the tree grows to a height of 60 feet. Passiflora edulis, and many other economically interesting plants we saw, but must refrain from enumerating them. As we looked at a plant of Ilex paraguayensis, Mr. Christie surprised us by remarking that it is in great demand, and that even in England there are thousands of people now taking the Paraguay tea as a beverage. Weed it a long time ago, but our memory of the liquid is still vivid, and we have no intention of repeating the experience. On the roof of one of the houses were Cissus discolor and C. albonitens, the latter with aërial roots 8 feet long. A variety of purple-leaved Coleus was noteworthy too, the leaves being larger in all respects than is usual.

Near to the southern entrance to the residence is a very old plant of Wistaria sinensis. It has been slung across to a variegated holly-tree, and now covers the top of this. An iron chain from one to the other has become embedded at either end through the growth made by the Wistaria and the Holly.

Before taking leave of Mr. Christie, our attention was drawn to a Wardian-case, then being filled with young rubber plants (Castilloa elastica) for exportation. The plants were dibbled into a compost in rows, and a flat lath placed over the surface between each. Then two laths were placed longitudinally along the sides of the case, and over the ends of those between the rows, thus securing the soil and plants from becoming loosened.—*Gardeners' Chronicle.*

FAIRLY WELL ISN'T WELL ENOUGH.

LET us say that your wages are twenty shillings a week. You have worked hard, done your best, and feel that you have earned your money. Very good. Now imagine that when Saturday night comes your employer hems and haws, and wants to put you off with fifteen. I'll be bound you would think yourself hardly treated. What are the great strikes in this country commonly about? Why in some fashion they are about wages or hours; it comes to the same thing. Be it understood that the writer uses this fact as an illustration of another fact—that is all. What is that other fact? We will work it out of the following personal statement.

"Nearly all my life," says Mrs. Sarah Dalby, "I have been subject to attacks of biliousness, accompanied with sickness, but got on fairly well up to the early part of 1882. At this time I began to feel heavy, dull, and tired with an all-gone, sinking sensation. My skin was sallow, and the whites of my eyes of a yellow tinge."

As everybody knows, or ought to know, the colouring matter was bile. The liver being torpid, and, therefore, failing to remove the bile from the blood, it entered the skin; and showed itself on the surface. But the discolouration isn't the worst mischief done by the vagabond bile, containing many poisonous waste elements; it disorders the whole system and sets up troublesome and dangerous symptoms, some of which the lady names.

"I had a bad taste in the mouth," she goes on to say; "and, in the morning particularly, was often very sick, retching so violently that I dreaded to see the dawn of day.

"My appetite was poor, and after eating I had pain at my chest and side. Frequently I couldn't bring myself to touch food at all; my stomach seemed to rebel at the very thought of it."

[This was bad, but the stomach was right, nevertheless. More food would have made more pain, more indigested matter to ferment and turn sour, more of a load for the sleepy liver, more poison for the nerves, kidneys, and skin. And yet, *without the food*, how was s live? It was like being ground between the upper and the n millstones.]

"After this," runs the letter, "I had great pain and flutteri the heart. Sometimes I would have fits of dizziness and go off a faint, which left me quite prostrated. Then my nerves becar upset and excitable that I got no proper sleep at night, an account of loss of strength I was obliged to lie in bed all day for together. I went to one doctor after another, and attend Bartholomew's and the University Hospitals, but was none the b for it all.

"In September, 1883, my husband read in *Reynolds' News* about Mother Seigel's Curative Syrup, and got me a bottle After taking it for three days I felt relieved. Encouraged cheered by this I kept on taking the Syrup, and in a short tin the pain and distress abated, and I was well—better than I had been. That is ten years ago, and since then I have never anything. With sincere thanks, I am, yours truly (Signed) Sarah Dalby, 93, Tottenham Road, Kingsland, London, N., Jan 2nd, 1894."

Now run your eye back to the first sentence of Mrs. Dalby's l and you will come upon these words, "*I got on fairly well,*" *This* is the sad thought. Her life has always been at a disc she has always got less than her due; she lost part of her hea wages. Do you take my meaning? Of course. Whatever ma our differences of opinion as to the rights of capital and the val labour, it is certain that every human being is entitled to pe health—without reduction, without drawback. All the mo nobody else loses what one person thus gains. No, no. O contrary, a perfectly healthy person is a benefit and a blessing who are brought into relations with him.

But do all have such health? God help us, no; very, very Why not? Ah, the answer is too big; I can't give it to-day. the vast crowd who only get on "fairly well" I tender my symp and advise a trial of the remedy mentioned by Mrs. Dalby.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (September 9, says:—A steady tone prevailed at auctions this week and the mar most cases was in seller's favour.

About 400 bags East India were offered, chiefly in small lots had been catalogued before. One good Neilgherry mark, however, re very full prices.

Central American kinds met good competition and several fine parcels were disposed of at extreme rates; but common descrip sold slowly.

Futures have been quiet with very slight fluctuations and quot are unchanged to 3d lower since our last.

Messrs. Wm. Jas. and Hy. Thompson say in their Report of the Co Markets for the Week ending September 7th, 1898:—Bank rate Bombay Exchange closes at 1s $3\frac{3}{32}$d. Brazil Exchange $7\frac{5}{8}$d. paper $3\frac{1}{2}$ % $62\frac{1}{2}$. Silver $27\frac{3}{4}$d per oz.

This article continues to meet a steady demand, prices for me qualities being about unchanged at the recent advance, whilst fine able growths realize very full rates to dearer.

Brazil markets quiet.

According to Messrs. Duuring and Zoon, the European stoc 1st inst. showed a reduction of about 3,600 tons, whilst the visible s was 48,850 tons larger, the respective figures being 203,800 against 207,400 tons, and 387,070 tons against 338,230 tons o 1st August.

Daily receipts averaged 14,400 bags in Rio, and 33,200 bags in Sa

Futures have been dull, and close about 3d to 6d per cwt. lower, Good average Santos in Havre, December delivery, fcs. 39.00, in burg pf. 32, and No. 7 low ordinary Rio in New York $5.75.

Prices realized at auction for the principal Marks of East India:—

London advices of 9th September state :—
Only moderate supplies have been brought to auction. Ceylon obtained ly recent values, and grey and faded East India brought relatively od prices. Ordinary descriptions of Foreign growths have sold slowly occasionally easy rates, but all desirable qualities met with a good mand and extreme prices were paid for good to fine Costa Rica and lombian. Futures have been quiet, and though no material change in ces can be quoted, the tendency has been rather easier, closing as lows :—

TEA.

London advices of 9th September report :—

China.—Demand remains poor in the extreme, private sales being of very little moment. At auction not much offered, and as the assortment was poor, only a small proportion sold. prices showing some irregularity, more especially for Green Teas.

Since our last 4,113 packages have been brought to the hammer, and partly found buyers as follows :—

half-chests new Moning siftings 2⅝d.
boxes new make Congou, 5⅛d to 6¼d.
boxes Canton scented Caper, fair to medium 4½d to 7d.
half-chests and cases Moyune Green :—Gunpowder, fair to medium 5⅝d to 7½d, good medium to good 7¾d to 9¾d. fine 10½d to 1s 2¾d ; Imperial 5¼d ; Young Hyson, low 2¾d, fair 4½d, medium to good medium 6d to 6½d. good 8d to 8¾d, fine Sow Mee 11¼d to 11½d ; Hyson, low 2¾d, medium 6¼d, good Fong Mee 7⅝d to 10d.
half-chests Ping Suey Gunpowder 4d to 4⅝d.
boxes ditto, fair 4⅜d to 4½d, good medium 7d.

Indian.—The quantity brought to the hammer was over that of last week, viz., 39,300 packages against 30,200 packages and 37,600 packages in 1897. No doubt owing to better deliveries for August and confidence imparted by the satisfactory statistical position of all Tea, there was an increased enquiry and the sales passed with good spirit, prices tending upwards for all useful liquoring descriptions. Pekoe Souchongs were in more request for home and export, a considerable trade being now done in these for the Continent as well as for America. Medium grades with thin infusions, however, still continue to rule irregularly and in buyers' favour.

For 30,800 packages on Garden Account 9½d per lb. was realised, compared with 9½d per lb. for 29,800 packages and 10d per lb. for 19,500 packages in the two preceding seasons.

Ceylon.—Auctions was smaller, amounting to 25,900 packages *versus* 29,400 packages in the preceding week, and 29,300 packages a year ago.

In the face of gradually decreasing supplies and more general demand throughout the country there was brisk competition for nearly all kinds, resulting in a rise of ¼d per lb. in many instances for common to fair

leafy sorts, and ½d per lb. for medium Pekoes and broken Pekoes. Fine and finest lots, especially when flavour showed improvement, also sold dearer.

Owing to the smaller quantity of fine invoices represented, the average remains at 7⅞ per lb., as at the beginning of the month, and 7¾d per lb. on the 9th September, 1897.

JAVA.—Nearly 2,000 packages of direct import were included in the catalogues and meet with a fair reception, former values being fully maintained.

DELIVERIES.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :—

From 1st to 6th Sept., 1898.....3,131,843lbs.
„ „ 1897.....3,586,131 „

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	35,553	3,730	39,283
Ceylon	24,550	1,315	25,865
Java	1,666	243	1,909
Total	61,769	5,288	67,057

Also 525 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated September 2nd, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899...	216,684 packages.	341,060 packages.	11,328 packages.
1897-1898...	199,081 „	371,565 „	13,090 „

30,423 *pkgs.* INDIAN
29,482 „ CEYLON
1,341 „ JAVA
} Total 61,246 packages were offered in public auction this week.

Indian. A welcome increase is shown in the month's deliveries of Indian Tea.

Quotations were maintained with strong demand, Teas of useful character meeting with brisk bidding and realising good prices. The weakest market was for medium grades, but Teas for price continued strong. The Official Wire gives exports to U.K. from 1st April to end of August as lbs. 47,917,000, against lbs. 48,178,000 same period last season. Averages :—"Amalgamated Tea Estates Co. Dooteriah," 2/3; "Beheating," 2/0¼; Amal. T Co. Kalej," 1/11.

Week's average of Tea sold on Garden Account 1898, 24,381 pkgs., av. 9·30d. 1897, 23,029 pkgs., av. 10d.

Ceylon. The auction was again fairly heavy but not too large to attract general competition in view of smaller arrivals, the Teas selling with a somewhat firmer tendency for all descriptions, with good competition. The Official Telegram gives exports from 1st January to 31st August as lbs. 67,000,000, against lbs. 71,250,000 same period 1897, and estimates quantity available for current month as 6½ to 7 millions. The following averages may be mentioned :—"Carolina T Co. Goatfell," 1/1; "Ragalla," 1/0¼; "Dimbula T Co. Lippakelle," 1/–.

Average for week 7·74d., against rather over 7½d., same perio year.

Ceylon Tea sold on Garden Account 1st January to date 790,111 pkgs., av. 7·60d. 1897, 778,776 pkgs., av. 7·60d.

Java. These Teas met with good competition and sold at prices. 108 pkgs. "Goalpara" averaged 10d. per lb. 9,542 packag to be offered in Amsterdam on the 15th September.

Bank rate 2½ per cent. Exchange on London three months si Calcutta 1/4 1/16. Colombo 1/4 1/16.

IN AUSTRALIA.

The following notes are from Australian papers :—

SYDNEY, *September 3rd.*—Private business included, 25 chests of Broken Pekoe at 7¾d. and other business was pending for about 200 ages for which vendors were asking ⅛d. to ¼d. more than buyers wer ing to give.

MELBOURNE, *September 5th.*—Sales of tea covered 1,300 half-che panyong at 5¾d. to 6d.; 75 chests of Ceylon at 6d. to 6½d. and 25 ch Ceylon at 10½d.

ADELAIDE, *September 1st.*—Tea sales have been of fair volume in C and China, at satisfactory prices.

PEPPER.

Black.—The tone of the market is firm but quiet, with sales esti at about 200 tons at full rates :—

Singapore on the spot (basis fair)		4 13/16d
do	Aug.-Oct. shipment (s.)	5d
do	Sept.-Nov. (s.)	5 1/32d
do	Oct.-Dec. (s.)	5 1/16d. to 5 5/32

At public sale on Wednesday 505 bags Singapore were offered bags grey sold at 4⅝d. to 4¾d. 234 bags Penang retired at 4¾d. to 4⅞

White.—The market is quiet, with only small transactions. remain unchanged, with sales of about 50 tons as under :—

Singapore (basis fair) on the spot		8¼d
do	Oct.-Dec. (s.)	8¾d
Penang, near at hand		7¾d
do	Dec.-Feb	7 15/16

Auctions on the 7th inst. embraced 203 bags Singapore and 15 Siam which were bought in at 8⅜ to 10½d, and 8¼d to 8⅜d per lb. respec

Closing report says :—

Black is firmly held, but business has been unimportant. Whit quiet.

GINGER.

Cochin.—Auctions opened at firm prices for washed, but subseque decline of fully 2s. per cwt. was submitted to; cut kinds are slow and everything catalogued was bought in, 36 cases 1,425 bags b forward and 670 bags found buyers as follows; medium and small w rough, mouldy (at the commencement of the sales) at 22s. 6d. to 23s. fair medium and small washed rough 22s., mouldy ditto 21s. 6d.; an fair brown rough Calicut Sorts 23s. 6d. to 24s. per cwt.

Japan.—98 bags dull limed bought in at 19s. per cwt.

Jamaica very slow, and the 150 barrels offered for competition the hammer unsold.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duft & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 14th October, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

Coorg.

Polli Betta, *5th October.—Weather.*—Heavy showers from N.-E. in the evenings or early part of the night nearly every day. More or less cloudy with hot bursts of sunshine during the day. *Plant-diseases.*—Leaf-disease still in evidence in parts. The portion keeping clear now may take it later, there's the rub. *Crops.*—Perhaps the earliest picking will not commence before beginning of next month. *Labour.*—Plentiful. *Works* well in hand. Digging getting on. *Health.*—Good. Slight improvement in prices of grains. *Interesting Item.*—Rifle Meeting fixed for 17th, 18th and 19th instant.

COFFEE ESTIMATES.

In our present issue we give a report on Coffee Cultivation in India recently issued by the Director of Statistics to the Government of India. Commenting on this, the *Madras Mail* observes that it is a pity that the statistics still suffer in accuracy and completeness because planters will not furnish all the information required. Our contemporary adds that "possibly the U.P.A.S.I. will take note of what the Director says on this point." The remark is a reasonable one, but it apparently presupposes (1) that the U.P.A.S.I. has *not* noted the matter and (2) that good would result from a mere "taking note" on the part of the Association. Here, it is to be feared, our contemporary errs, for in a matter of this kind the Association does not seem able to do much. At the last meeting the subject of "Crop Estimates" was on the Agenda paper, but when the discussion began it turned on *Tea* estimates alone. A resolution was passed that was certainly satisfactory in form, but there are not wanting sceptics who doubt if any useful practical result will

follow the passing of the resolution. In fact, South Indian tea-planters are not keen in preparing and publishing crop estimates, and it is probably fair to say that South Indian coffee-planters are strongly opposed to the framing of estimates. It is impossible for us to explain their objection. If some one among their number would enable us to do so, he would place us under a lasting obligation. We scarcely think, however, that any Honorary Secretary of a Planting Association in a coffee district will contradict our assertion that estimates are not in favour. As already stated, this is true of tea districts also, though in a minor degree. A glance over the estate statistics published in the U.P.A.S.I. book of proceedings, 1897, will show that an attempt was made to acquire information regarding crops, and that particulars were forthcoming in only a very few instances—in not one, we think, where coffee alone was cultivated on the estate.

It is a well-known fact that for practical purposes South India is the sole coffee-producing centre in India. The figures relating to Burma and to experimental cultivation in Sylhet and elsewhere are so small as to call for no notice. Coorg has official estimates prepared from time to time, but the remaining coffee-producing areas are to all intents and purposes beyond the pale of estimates. Figures relating to Coorg are unreliable, and even the after-statistics that purport to give approximate actual yields in Coorg, Mysore and elsewhere could scarcely be accepted as very trustworthy. Still, Coorg marks a small advance upon her rivals, and it is not long since we asked the question why Mysore and other centres should not follow suit, and furnish annual *official* estimates, if planters themselves will not move in the matter. The effect of estimates on the chief markets of the world is well known. In the report under reference we read: "In 1896 prices receded to a lower level, owing principally to reports that the Brazilian crop would be the largest on record." When we also find that since 1895 the production of Indian Coffee has been falling off, is it not reasonable to suppose that a forewarning of this in the shape of reliable estimates might have helped to counteract a downward tendency in prices of Indian descriptions. It is not our intention to suggest that Indian estimates would ever be as important or influential as Brazilian, or would receive as much attention in London and other markets. They could never influence the general run of values. But we are probably not wrong in saying that although the course of prices of Brazilian Coffee largely regulates that of all other sorts, still, the various circumstances that peculiarly affect East Indian crops are not without some influence on the demand for and prices of East Indian sorts. In other words if the Brazil crop shows a large increase, prices generally will tend downward, but if East Indian crops show a really important decrease, the downward tendency will, in all probability, be less marked with East Indians than with Brazils. That is, on the assumption that buyers are equally well informed regarding the probabilities of crops in the two cases. If corroboration of this be needed, we refer our readers to the quotations from a London commercial paper that are given on another page, under the head of "Coffee prospects in London." It is there distinctly stated with special reference to Coffee:—"We have been asked by several members of various branches of the East Indian trade to keep them well posted with regard to developments in those districts in which they were particularly intereste Again: "Small supplies, stiff prices, and we fear v little business, will be the result of the unsatisfactory stat affairs in India. Had the London Coffee market ma tained its strong position and 'bull' fever, the exorbit ideas of Coffee planters on the Coast would have ha chance of being realized, but since 'bears' have supersed 'bulls' again in Rios and Santos, the outlook for a g business in fine coloured East Indian has become m gloomy. The possibilities of a Brazil crop of 8,000,000 ba we fear, are hardly favourable to a strong 'bull' mo ment, although prices are low, but a crop of 8 millions lo small at the side of the last yield of 10,500,000 bags. great deal will depend upon the prospect of the next Bra crop."

Then again we may remark that the present price Brazilian coffee is the lowest ever known, though it wo appear that the estimates published from time to time h certainly not been exaggerated. Messrs. W. H. CROSSMAN BROTHERS, of New York, state in a circular dated 26th Aug that for years past many people at Rio have wilfully m represented the statistical situation to such an extent as admit of no doubt of their purpose. The following exam is then given: Stock in Rio, July 1, 1897, 228,000 bag receipts in Rio, July 1, 1897, to June 30, 1898, 4,301,(bags, together 4,529,000 bags. The shipments for crop season, July 1, 1897, to June 30, 1898, were 4,569,(bags, showing a difference shipped over and above stock and receipts of 40,000 bags, and yet leaving a st on hand there on July 1 last of 268,000 bags, which rea means a total of 308,000 bags of coffee more than w reported in the receipts, without any allowance being ma for home consumption. The strong remarks made Messrs. CROSSMAN thus appear to be fully justifi Finally, Messrs. CROSSMAN expect the total available qu tity of coffee from Brazil in the current season will exce 10,000,000 bags. This crop's receipts so far are the larg on record, excepting last season. This scarcely looks w for prices. The above shows, however, that the influence estimates is recognized in Brazil; and we cannot but thi that Indian planters lose more than they gain by failing draw up a well-considered scheme of framing and publis ing estimates.

NEW MARKETS.

THE *Planter* remarks that the greatest need of the T industry at present is new markets. In this we fully conc but the recommendation our contemporary makes for op ing up new markets does not commend itself to us. C contemporary suggests that superfluous men should not thrown out of work, as many are only too likely to be, the close of the season, but that proprietors, shareholde directors and agents should form a "Bulking Compan and start at once, make up a "standard mixture," a pack up sample boxes; that they should send out, all world over, the planters whose services are available salaries that should be moderate, but give them a suffici allowance to keep up their position as gentlemen, and w a commission dependent on their success in the busine This is not an idea that strikes us as practical. We sho rather say, let planters plant, and commercial travell

ut for business. Every man to his trade. There may be me notable exceptions, but in most instances the planter ould make a poor canvasser. Our contemporary ventures predict that if the scheme here outlined were adopted, in two or three years' time there would be an enormous xpansion in the consumption of Indian tea." It might be , but would not the *cost* also have been enormous, and t of all proportion to results?

CEYLON TEA ESTIMATES.

Those of our readers who have perused our leading article the present issue will readily understand the regret we lt at learning, after it was written, that the Udapu-llawa Planters' Association had passed a resolution That this Association regrets the publicity given to the ea estimates, which have seriously affected the price of tea uring the past three months; that if it is necessary to rame and issue estimates for publication, this Association eprecates that the Thirty Committee should not exercise ore care and caution, and from time to time revise these stimates as the season advances, and remit this informa-on to the Ceylon Association in London. This Association of the opinion that, had this been done earlier in the year, hen the shortness of crop was apparent to everyone, the ea markets would, in all probability, not have remained in uch a depressed state. This Association further regrets hat, when the Thirty Committee did revise the crop at heir recent meeting, the estimate was not reduced by at east 10 million lbs., or perhaps even 12 instead of 7." From n Association with such a full-mouthed name as "Udapu-llawa" much of evil might certainly have been xpected, but the only redeeming feature about the pass-ng of the above resolution is that out of 10 present person and three by proxy only four voted—all in favour f the resolution. Perhaps it is illogical and unreason-ng on our part that we should blame the six non-voters ore than the four voters; but we certainly think that neutrality" in a matter of this kind is, in its way, as eadly as "indifference" in matters of religion. If the eylon planters cannot make their estimates approximately orrect, that is certainly no reason why they should ondemn estimates *in toto*. If in times of short crops stimates cause prices to rise, surely planters ought not to rumble when in seasons of plenty prices fall. Moreover, e venture to suggest that unduly high—as well as low—stimates have a tendency to cut both ways. The former heck, the latter stimulate, any tendency towards over-roduction. The disease helps to work its own cure, or in the face of high crop estimates he is a bold man ndeed who pushes on the work of extension as boldly as if he estimates were low.

GREEN TEA.

There has been a fair amount of discussion in Ceylon ver the proposal to grant a subsidy to Green Tea, and one ritic has suggested that funds raised for the purpose of ushing Black Tea cannot be rightly diverted to the new bject. Another writer says that the Green Tea scheme s merely a revival. It was proposed by a New York roker in 1881, was strenuously opposed in Ceylon in 1893, and is now being advocated there. Among the advantages of making Green Tea this writer includes the following:—"The chief advantage will be that with the same quality of leaf from which you now make 50 per cent. of tea which will pass through a No. 12 sieve, you will get at least 80 per cent. of the new tea through the same sieve. In other words, you will have 80 instead of 50 per cent. of "Pekoe" grades, and 20 instead of 50 per cent. of Souchong grades which include the broken tea. The reason of this is that the lightly fermented and green teas are rolled while hot. The rolling and firing are alternate, and the leaf gets more and more sticky. At length it gets so sticky or gummy that each folding of the leaf is firmly held. In cold rolling (as in black tea) there is not sufficient gum developed, or rather the gum is too diluted with water, to make each folding stick tightly. Consequently in hot rolling the leaf becomes very much more tightly folded up, and of smaller grade than in cold rolling. I once made a sample of hot rolled tea which sorted out 80 per cent. of Orange Pekoe, *i.e.* of tea which went through a No. 14 sieve. But the ordinary cold rolled black tea from the same leaf gave me only 18 to 20 per cent. of tea of No. 14 grade; but at that time there was no demand for that sort of tea." Another advantage is that by the help of warm air the leaf takes much less power to make up with tightly curled and twisted tea. The adjective "green" does not, however, commend itself in the above connection to this critic, and he says:—"Green tea is a misnomer, and we want some short term to express our intentions:—

Light Indian Tea } would do fairly well.
" Ceylon " }

Indian or Ceylon 'Silver Tip' would sound well for the finer grades, as all these teas have

silver } instead of gold } buds or tips.
white } " yellow }

'Indian China' or 'Indian Japan tea' would be honest and would probably show the Americans that *our* China tea is better than that from China and so induce them to favour it." We can imagine an American grocer trying to sell "Indian Japan" tea!

NOTES.

Ceylon Tea Sales. At the public sale of Tea in Colombo on 27th ultimo, prices were on the whole firm at about the previous week's level.

Coffee in London. Latest mail advices refer to a good demand and steady prices, except for ordinary descriptions, which continued in excess of requirements.

Coffee Freights. Can any of our readers inform us what may be regarded as a nominal or average rate of freight on Coffee from the chief *Brazilian* ports?

Tea Samples per Post. We have seen no official declaration of maximum weight of tea-samples per post, but would recommend that none should

exceed 8 oz., as this is believed in some quarters to be the limit.

The Java Cinchona Factory. We must apologise to our readers for the omission from our last issue of the extract concerning "The Java Quinine Factory," now given on another page. It was referred to in our leading columns last week, but was held over by our printers in consequence of press of matter. They, unfortunately, failed to notice the connection between it and the leading article.

Calcutta Tea Sales. The average of the last Calcutta Tea Sales was five annas two pies. About 15,500 packages were offered on Friday, 30th September. There was a decided improvement in the market, there being good enquiry for all grades, but especially medium grades. The Bombay and other outside demand was also good. Taken all round, says the *I. P. G.*, this was the most satisfactory sale of the season. About 15,300 packages were sold, and teas for price were very firm.

Another Expert wanted. A cry is now being raised in Ceylon for the retention of Mr. Carruthers as cacao cryptogamist. It is pointed out that the N. E. monsoon is the most critical period for cacao fungi and that a Scientific Agricultural Department is an absolute necessity for Ceylon now. A correspondent even goes the length of saying that it is monstrous that Ceylon should be so far behind Java, which has a European staff of twenty-five scientific men attached to the Botanical Gardens.

A maximum size of Tea-Chest. The Colombo Tea Traders' Association have carried a resolution that the attention of planters and agents be drawn to the fact that packing more than 100 lb. in a chest, when the teas are for sale on the Colombo market, is prejudicial to the sale of such teas. This is owing to the action of the mail steamship companies stamping all Bills of Lading for the Colonies with the clause, "No package to contain more than 100 lbs. nett," and their declining to pay claims, when packages contain more than this amount.

Ceylon's Exports. The annual memorandum on the Trade of Ceylon for the first half of 1898, issued by the Principal Collector of Customs, shows that of *Tea* there were exported 65,236,220 lb. against 62,387,699 lb. in 1897, the value per lb. in 1898 being 38½ cents against 44¾ cents in 1897. Of this increase, 1,493,102 lb. went to Australia, 213,173 lb. to Hongkong, 1,024,383 lb. to Russia, and 590,767 lb. to United States of America; but there was a decrease in the exports to the United Kingdom, Canada, and New Zealand, of 569,472 lb., 72,715 lb., and 18,506 lb., respectively. Of *Cinchona* the quantity exported rose from 364,505 lb. in 1897 to 563,986 in 1898, and of *Cacao* from 19,746 cwt. to 29,454 cwt.

Tea in London. Fully previous rates for good qualities, common somewhat cheaper than a week earlier. This is the report from London regarding Indian Tea. Auctions of Ceylon were small and demand brisk, the latter being no doubt partly due to the reduced estimates just published by the Planters' Association of Ceylon. Some remarkable prices were obtained for Dar lings, which ranged as high as 2/2*d.* for good bre while Ceylon went up to 1/8¼*d.* per lb. Telegraphic adv dated 29th September report a steady market with g liquoring Pekoes in improving demand. Price of fair liq ing Ceylon Pekoe Souchong 6½*d.*; average 8¼*d.* (¼*d.* dov 24,000 packages Ceylon offered, 23,000 sold. Of Ind 40,000 sold out of 46,000 offered. Average 8¾*d.* (⅛*d.* do

Darjeeling Tea. Messrs. Baines & Co. write their circular: "Many planters s to have an idea that 'Darjeeling Tea sells as Darjeeling whether possessing the true flavour peculiar to the dist or devoid of it; but it should be most emphatically before them that in no other district is the differe between 'fine' and 'ordinary' more marked than in t own! nor is the reason far to seek. Fine flavoury Darj ings serve a special trade, and are not blended with o kinds, as are teas from other districts, and this special tr will not buy poor flavourless teas; therefore poor liquo Darjeelings have no identity, but go into the general ruc poor liquoring teas, of which at the moment there is a v plentiful supply." The truth of these remarks needs demonstration.

Coffee in the Straits. Mr. Donald Mackay reports Coffee has not been such a finan success in the Straits as was at one time expected, due a great measure, to the extraordinary fall in prices wh has lately taken place, but also to the ravages of a s bronze insect which feeds freely on the leaves of the tr and has very much the same effect upon it as leaf dise The ravages of this insect has been, according to Mackay, very severe indeed, and though in many est large numbers of coolies are employed in catching destroying it, the harm was mostly done before the ins could be exterminated. Still, he has seen a good dea Liberian doing very well at the Straits where interspe with cocoanuts. Sir Græme Elphinstone has a large ex of Arabian as well as some Liberian coffee on his prop which runs from 1,800 to 2,500 feet altitude. "Logie" indeed planted 300 acres since he came out three y ago.

Artificial manuring. Writing to the *Times of Cey* "Sceptic" asks that some planter at least five years' experience should state the result of s

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain ton:—

61·50	lbs.	Nitrogen.
57·38	„	Potash.
14·92	„	Lime.
13·68	„	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed f the parent trees of above analysis at Rs.6 per pound contai about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere from the

MANAGER, ARIENKOW ESTATE,

Shencotta

rience. "Here," he says, "owing to length of transport, artificial manuring costs roughly Rs.60 per acre, and what I gather (I haven't tried myself), the results are ncrease, first year (in fairly good tea) of about 80 lbs., second year 120 to 150, and the third year about 100 an acre, after which the tea goes back to its original l or less, unless it is manured again. This doesn't n to me to be good enough, as allowing the profit to be ents per lb., 300 lbs. increase during the three years, ly gives one back the original outlay less interest, and bers of estates are making nearer 10 than 20 cents lb. profit. What I and, I am sure, many others would nost thankful for would be a few figures dating back, five years for tea which was *then* in full bearing :—

40 acres field, which gave so much per lb., in 1893 was manured at so much per acre in 1894.

Yield in 1894	Yield in 1896
„ „ 1895	„ „ 1897"

inquiry is a pertinent one, and we should be glad to South Indian planters also "counting the cost" of ficial manuring and comparing this with the benefits ded.

---

lity not quantity.

Addressing advice to Natal, the *Produce World* utters remarks that uld be carefully noted in India :—"Quality not quantity hat many places suffer from not paying attention to. is one of "The Produce World's" stock principles, sistently applied to every part of the world, that, just blood tells in a severe race, so quality comes out at the of the keenest competition. That we are not alone in opinion that the cheap and nasty will not pay in the g run is evident from the following remarks by the *ican Review* :—'Natal industries always seem to meet h some *nasty jar* just as they are turning the corner. e wattle-bark trade flourished greatly till some un-ncipled exporter spoilt the market by mixing much bad h little good. Then there is Natal coal, which frequently s the blame for mail-boats being behind time; and like policeman, isn't there when it is wanted, on the quays Durban. And now, Natal tea is having anathemas led as its fragrant head by experts at the Durban ricultural show. It is not that the Colony cannot oduce good quality, but the growers are so very anxious turn out record quantities that they neglect the quality so doing. There is clearly room for much improvement Natal's present industrial method." "Quality not antity" and "new markets" should be the watchwords Tea Planters' Associations for a long time to come.

---

ina's Currency.

The following remarks of the *Economist* should interest many of r readers :—"The following extract from a report by Mr. nsul Fraser on the trade of Wuhu may be commended those who have been contending before the Indian rrency Committee that if anything is done to maintain e exchange value of the rupee at a higher level than its trinsic value, the tea industry of India and Ceylon will be riously handicapped in its competition with China, whose rrency is on a silver basis. For the fact of the matter is at the real currency of China is not silver but copper cash, d what Mr. Fraser points out is that relatively to silver is currency, as well as the rupee, is greatly appreciated. He writes :—"Copper cash continue to be very scarce and dear, as compared with silver. The reasons given for this scarcity are two : the large movement of cash to the North for Army use during the recent Sinico-Japanese War, and the melting down of large old cash by persons who find a profit in selling it when thus reduced to its primitive condition of copper raw material. Whatever be the cause, the results are a great deal of distress and inconvenience. It takes $1 now to buy from 880 to 900 cash, whereas formerly $1 would fetch 1,130 or 1,140 cash. This is a reduction of nearly 30 per cent. in the value of dollars, and a native paid $6 a month wages now is in a worse position than one who got only $4 when cash were cheaper, taking into account the rise in the price of necessaries, such as oil, salt, fuel, rice. For instance, rice, which formerly cost $2 20c. or $2 30c. a picul, has risen, successively to $3 40c. $3 50c., $4, and of late much more, a picul, and colza oil is at double the price it used to cost." The statement that copper and not silver is the currency basis for the China Tea trade is one that calls for further investigation.

LETTERS TO THE EDITOR

THE LADY-BIRD.

SIR,—An "Old Planter's" remarks on lady-birds, in your issue of the 1st instant, are rather wide of the mark. It is well known, and has often been mentioned in *Planting Opinion*, that certain lady-birds are purely vegetable feeders. It is equally well known that certain lady-birds are purely scale feeders. There may be lady-birds that do a little of both. Surely there is nothing wonderful, therefore, in the fact of a certain lady-bird taking half an hour to eat an aphis! I have seen the indigenous black lady-bird eat, or rather suck, the scale at the rate of two or more a minute. But surely it stands to reason that the lady-birds Mr. Newport brought out were chosen from among the purely scale feeders only, and moreover those that did the best work, *i.e.*, devoured the scale the fastest, will naturally have been chosen. The "Old Planter's" suggestion from the particular to the general is misleading.

"LADY-BUG, JUNIOR."

"GAINERS BY EXCHANGE."

SIR,—I have read your article headed "Gainers by low exchange," and I cannot say that I agree. The question of the currency of a country is on a much wider basis than its effects upon any particular class of the community. For instance, our exports were thirty millions in excess of our imports; it is clear then that after paying for our imports India had a surplus of thirty millions to expend, in fact was richer by those thirty millions. If the Government could not pay its way, it was open to it to levy a tax on exports, which would have only fallen upon the country at large, which having gained thirty millions could easily part with ten or twelve millions to assist the Government out of its difficulty, and yet the Government declines to put in force the simple remedy of a tax on exports. The question regarding the Government policy is this: have the exports fallen off since the closing of the mints, in other words to what extent has the country gained or lost? If it can be shown that the country has gained, then as a matter of course the Government policy is correct; on the contrary, if the country has in a conspicuous manner declined in its exports, then is the policy of Government condemned.

In 1895-96 the imports were about		70	millions.
Do.	the exports „	114	„
In 1896-97 the imports were about		72	„
Do.	the exports „	104	„

Here in one year we have the exports falling off ten millions; this of course might be due to the famine, and it would be unfair to take 1896 and 1897 as a criterion—if the average of five years is taken, say, from 1894 to 1899, we shall be able to judge of the effects of closing the mints in the country at large, and it would be premature to strike an average under five years.

It seems a self-evident proposition that a Government which taxes its exports some 40 per cent. will in course of time succeed in killing its exports—and then gold or no gold the country is ruined. Instead of a surplus the country will be unable to pay for its imports, where then are the taxes to come from? As for the gold currency, it will disappear and become gold bricks buried deep in underground cellars; that has been the fate of the gold mohurs, which at one time were plentiful, but have not been heard of for the last 60 years? Ask about a native's worth you will be told he has plenty of gold bricks.

It seems an astonishing fact that persons who know nothing of the habits of the people of India should have been consulted regarding a gold currency. Natives are very reticent regarding their gold deposits. No doubt merchants in the great towns are obliged to have a certain amount of cash in banks and Government securities, but the bulk of the monied class does not consist of merchants in towns only. It is notorious that the income-tax merely touches a fringe of the people. In fact, the buried wealth of India must be enormous, and it is still being added to; and seeing the great depreciation of silver it is certain that gold alone will be converted into bricks for the secret hoards. The great need of the Government is a good financier who will take a firm grasp of the situation and not narrow his views down to one particular idea, such as a gold currency contracting the silver currency, and such fallacious ideas.

Under a depreciated rupee the country gained, it remains to be seen how the country will emerge after a fair trial of the enhanced rupee. Much more might be said on the subject of the currency, for the subject is exhaustless, but for the present I have written enough.

OBSERVER.

GENERAL ARTICLES.

THE U.P.A.S.I. SECTION.

(UNDER THE CONTROL OF THE SECRETARY, U.P.A.S.I.)

THE Madras Government does not see its way, "in the present financial circumstances," to reconsider its decision not to co-operate with the Mysore Government or the U.P.A.S.I. in regard to the appointment of an Agricultural Chemist. It has, however, informed the U.P.A.S.I. of its belief that the Government of India has under contemplation the appointment of an Entomologist as referee for the whole of India; and has further stated that a Botanist acquainted with industrial problems connected with his science is shortly to be appointed for the Madras Presidency.

This is not very much perhaps, but it is at least a step onward, and if the industrial botanist is industrious, and reads his instructions in a liberal spirit, planters may derive much assistance from him.

Mr. Jno. C. Sanderson writes that he has taken steps to bring the subjects of the classification of Coffee and the reduction of the British Tea Duty before the London Chamber of Commerce at a meeting to be held on the 13th instant.

THE NORTH AMERICAN TEA MARKETS.

A WRITER in the London *Daily News* deals with the fight tea markets of North America. "Our American cousins," "are not great tea drinkers, but they are gradually coming to the English habit. For several years past the Assam have subscribed to maintain a representative in the United whose sole duty is to push the sale of Indian tea, and the re so far been very satisfactory. The amount of Indian and tea taken by North America increased from 9½ million po 1896 to 11⅓ millions in 1897. Japan is our rival in the field, showing great energy. The Japan Government has allotted £80,000 to be spent in three years on the campaign, example may be commended to the attention of the Governm India which leaves the planter to carry on the struggle unas

ELECTRICITY AND THE GROWTH OF PLAN

ONE of the most attractive papers read on the closing the British Association related to the effects of electricit the growth of plants. Some striking experiments were des showing how electricity hastened the development of Under electric influence, for instance, strawberries yielded of 75 per cent. better than that grown under normal cond whilst the time necessary for maturing the fruit was lesse one-third. Some of the facts mentioned were not new, b novel theory was advanced that electricity helped the gro plants by enabling them to absorb water in greater propo and in the water, of course, there contains, in solutio mineral matter that goes to form the structure of the The whole question, however, does not seem to have beyond the experimental stage, and it is noteworthy tha Kelvin, who took part in the discussion on the subject, d appear convinced of the soundness of some of the arg used to show the favourable influence of electricity upon growth.—*H. and C. Mail.*

A MOVEMENT IN TEA.

IT is a peculiarly significant proof of the continual decline China tea trade that just now, when teas from the celestial are practically a drug on the market with no activity or pro them, and only a retail trade passing therein, buyers of Indi should be coming forward quite briskly and the market beco at good prices. The teas from our own possessions are quality this year, and now that they are landing in large buyers have a good selection, and we are able to test their o of the new arrivals. The good prices realised last week, as 2*s.* 4¼*d.* for Indian, show the estimation in which some gard held, and evince that steady improvement which is destined the China trade altogether unless great changes are effected methods of preparing for market. It is curious that the a work out at pretty much the same rate as this time last yea the sales are a trifle ahead; but the bidding has become prett just now, and the clearances will be heavier for the month market should have been relieved of a great weight often th by demand from outside these islands, and indeed it is very ne

production goes on increasing quicker than we can cope with
. But the fates have interposed a check. The efforts put
by the Indian and Ceylonese Associations to educate the
n public to the value of their teas has had its effect, and sales
e England have increased very much of recent years, while it
itable that the taste once created the further increase is only
ter of time. The sale of these teas is now increasing in
ica, for although only 1,955,039lb. went there in the first six
s of this year, against 3,137,942 in 1897 from India, Ceylon
ved very much, sending 4,290,404lb., against 3,442,394lb. last
America took more than she wanted in the corresponding
l last year, fearing a tea duty. Any increase this season would
itimate.—*Grocers' Journal.*

THE LURE.

E following amusing letter from "Friend of the Clergy"
ars in a Ceylon contemporary :—

How to Catch Creepers.

h reference to a paragraph in your London Letter of 9th
mber, referring to Archdeacon Dunbar, in which your corre-
ent mentions that this worthy was once "employed in some
f capacity by the firm of Williamson & Co., the creeper-mongers
leman St.," I have a word or two to say. He was!
November, 1892, I replied to an advertisement of the above firm
ng a vacancy for a pupil on a tea estate in Ceylon, and was
to call at their office to interview "Our Principal."
vent at the appointed time, and was duly received by Mr.
amson, who talked somewhat big, and said he must make en-
es as to my character, before deciding as to my fitness for the
ancy"!! (Note the *finesse.*)
n my turn, now asked some questions, one of which was as to the
ing to be obtained in the Island. The head of the firm pleaded
y to never having been in Ceylon, "but," quoth he, "there is a
eman who happens (?) to be in our outer office, who was many
out there and who can give you any information you require
at score." *Exit.*
presently re-entered, ushering in, with due reverence, an
ubted Archdeacon in full war-paint—apron, gaiters "cut saucy
the trotters," curly brimmed hat; and, to crown all, a blue
coat trimmed with bright yellow fur.
this presence I was now introduced and told, in honeyed
ts, of the joys of the spicy isle. He said he had been an Army
ain out here. Well, when Mr. Williamson thought I had
owed the bait, he withdrew his decoy, and I saw him no more.
ow dismissed me promising again to straitly inquire into my
edents.
vent to my guardian, who had to be consulted, and told him all
things, and he marvelled and said:—"My boy, everything
s very satisfactory, and, surely, the firm *must* be a respectable
if the principal is on such good terms with an Archdeacon!"
d it came to pass that, after a season, I took ship for Ceylon
here I am.
don't bear any grudge to this prelate, as I've not done so badly
I came here, but I wonder how many more parents and
dians he had helped to make up their minds as to whether or
"Algie" or "Bertie" should go "into Tea?"

THE AVERAGE YIELD OF TEA ESTATES.

Mr. H. Drummond Deane, of Peermaad, writes to a
lon contemporary as follows :—

was very interested in reading the evidence given by
srs. T. N. Christie and Leake before the Commission in London,
we owe a very sincere vote of thanks to those gentlemen for the
ise and able way they fought our battle. I would only urge that
were, if anything, too sanguine in their estimates which would
to make outsiders believe we were better off than is the case.
take it that the average of 320 lb. an acre for the 360,000 acres
ng 116,000,000 lb. is nearer the mark than 400 lb. an acre, for,
gh it is true a considerable amount of this acreage is not in
ing yet, it must be taken into consideration that many favoured
places with virgin soil or exceptional climate give from 600 to 800 lb. per acre. I believe if these places were eliminated from the estimate as well as all the tea not in bearing, the average would not be over 350 lb. per acre with the present system of plucking two leaves and the bud; and of the estates working on that average yield per acre, I doubt if justice can be done to them if they put their tea f. o. b. as low as 25 cents to 26 cents. Of course, when retrenchment is the order of the day, savings can be made in many ways; for instance, by non-clearing of drains; cheaper but not thoroughly good pruning; reduction of salaries (low as they are); and native supervision instead of European; but these are after all only temporary expedients resorted to in the hopes of being able by so doing to weather the storm. It seems to me that if, as I assume, a very large proportion of estates only produce from 300 to 350 lb. per acre, they cannot produce under 28 cents to 29 cents f. o. b., unless favoured by conditions of transport or by adopting some such temporary expedients for cheap working as mentioned above. And again when we take the Ceylon average at $7\frac{1}{4}d.$ to $7\frac{1}{2}d.$; if we look through the weekly sales, we will find many, too many, estates getting considerably less, and these estates are bound to go to the wall, if exchange keeps up and prices do not rise. While believing as I do in the survival of the fittest, still that is poor consolation for those who have to throw up the sponge, probably to be bought up at half this value, by the purely benevolent Sir. T. J. Lipton, who, at *a price*, would no doubt like to become one of Ceylon's largest producers, and so justify the misleading maps and advertisements he has been foisting on the public for some years.

I will not further trespass on your columns, but would add my protest against the action of the Indian Government to that of Messrs. Christie and Leake, and I have tried to show, strong as their case is, that it was really not strong enough—and that every Colonist should by every means in his power make known that public opinion of the producing classes is dead against the "Leiter" like corner of Silver by H. M. Indian Government. Had it not been for the American-Spanish War, we should have had the wheat producing industry of India in as bad a state as the tea, coffee, indigo, and cotton industries are to-day, but war prices saved them for the time. Something must be done for us, or it will soon be a repetition of 1879-80 with coffee, with only this difference, that in the former case it was a visitation of Providence, while in the latter it's a deliberate action of Government, who appear stimulated to copy Mr. Leiter in what he thought a very paying corner-game, but which ultimately knocked him badly.

A PERFECT CUP OF TEA.

The Secret of the Japanese.

A lady who has just returned home from a visit to Japan has brought with her the secret of how to make a "perfect cup of tea," as she calls it. It is really astounding, she says, that none of our writers have taken the trouble to explain the intricacies and inner secrets of the art of tea-making. They have given all their time and space to the women, the flowers, the odd life of the people, and the gay colours, utterly ignoring what to most women is of great importance, and, incidentally, great comfort.

When I arrived at Nagasaki I secured the services of a little Japanese girl, who was regarded as one of the best tea-makers in all Japan. She came to my room and brought her tea kit with her. She spoke a little English, and when I made my wants known and informed her that I desired to know every trick in the art, she squatted herself on the mat in a bay window, and the lesson began.

First she lighted an alcohol lamp, although a charcoal brazier is just as good, and placed upon the flame a quart of fresh, clear water, which in about five minutes came to a boil. While the water was heating she placed in another kettle a small portion of green tea. She carefully shook the kettle until the tea was spread evenly over the bottom, and when the water in the first kettle began to boil she removed it from the alcohol lamp and set it on the tray until it ceased to bubble. When it stopped seething she poured a sufficient quantity of the hot water over the tea to fill a small tea-cup, and then as quickly as possible poured it out, without letting it steep at all. There was the trick.

She explained to me that the tannin in tea is poisonous, and that the first contact with hot water takes from the leaves all that is worth drinking. The steeping process, common with us, is fatal to perfect

tea. When her brew came from the spout it was a colour between pale green and amber, such a colour as I have never seen in home-made tea. She passed the cup to me without sugar or milk, and I tasted it expectantly.

It was simply perfect. There was hardly more than two or three mouthfuls, but I supped it for about five minutes, during which time every draught seemed rich with a strong perfume. Like Oliver Twist, I asked for more; whereupon she removed all the tea grounds from the second kettle, and began all over again. I was informed that there was sufficient strength in the remaining tea grounds to make another cup if necessary, but the first perfect aroma was gone. No Japanese who understands the art will permit a second cup to be made out of grounds which have once been wet. The tea should be drunk immediately, and a fresh cup should be made whenever more is required. After each pot is made, and the grounds are emptied again for the next brew, the pot should be allowed to dry from the heat it has gathered during the process of making the tea. This precaution will be found wise, as it enables one to keep the tea dry until the hot water is ready to be applied. In no case should the water be boiling, as its action on the leaves will be too rapid, and the tannic acid will indicate its presence to the tongue, creating a taste that is not pleasant when one becomes a regular tea drinker. There are no harmful effects from tea drinking if the recipé I have given is carefully followed. It can be drunk at any and all times and at any hour. It will make your sleep peaceful, your hours of wakefulness pleasant, and your digestion regular. Never use sugar or milk, and above all things, do not steep it for a second.—*Scotsman.*

PRODUCE AND PLANTING.

THE IMPORT OF PRODUCE IN AUGUST.

The trade returns show that the import of tea for the month of August as compared with August, 1897, while higher in quantity, was lower in value. Cocoa, both raw and prepared, is lower in quantity and value.

TEA SHARES AS INVESTMENTS.

It was a lady client who hurriedly wrote to her broker last Friday saying that she heard tea shares paid such high dividends, and would he please buy her a pound at once, as she was afraid other people might have found out how cheap they were when everyone is bound to buy tea, &c. With this little prelude the *Westminster Gazette* discusses tea shares as follows: "It is certainly a little surprising that the market for tea and coffee shares should be such a restricted one, for the yield to be obtained ranges from £3 17*s.* 6*d.* on Singlo to 12½ per cent. on Dumont Preference. But the industry is such a fluctuating one, in view of the climate and other natural conditions of the countries where it flourishes, that there is more than an ordinarily speculative risk which must be accepted by the tea shareholder. The last meetings held by the companies, for instance, were almost unanimously doleful, earthquakes, the price of silver and the alluvial difficulty having played havoc with the profits; but if an investor is prepared to 'stand the racket' of a speculative share for the sake of the interest that it yields, perhaps he might profitably turn his attention towards the tea gardens of Ceylon, India, and Burmah. Another great difficulty which the companies have to face is that of obtaining fresh for the sale of their produce, but we imagine that in these commercial activity, an ever-increasing attention will be pr devoted to this side of the business."

THE PARIS EXHIBITION.

The French authorities are not particularly friendly toward and the Colonies in the matter of space at the forthcomin Exhibition. It is assumed that they are jealous of Colonial The space offered is quite inadequate, and there is no mov French authorities to grant more at present.

ALLEGED ADULTERATION OF CHINA TEA.

A case of alleged adulteration of "caper" tea was recentl at Manchester, when a grocer was charged with the offe sample of tea retailed by the defendant was certified by t Analyst to contain 2¼ per cent. of foreign mineral matter, pri sand and ferruginous earth. It was not alleged that the matter was injurious. The defendant denied all knowledge part that the tea was adulterated. He suggested that the had made a mistake, and asked that a sample might be Somerset House for analysis by the authorities ther magistrates acceded to this application, and adjourned the a month.

LAST WEEK'S TEA MARKET.

The improvement in the demand for Indian teas, says the *Markets Review* of last week's tea sales, is well maintained, bidding at the public sales was active for good medium descriptions. Although the latter formed a somewhat lar portion of the supply, prices were on the whole about on a p those of last week, the only difference of importance being showing less desirable quality, which sold irregularly and m buyers' favour. The few finest Darjeelings continue to m active competition, and values have shown a rising tendenc the finest lines of Assam have sold at very firm prices. In t lower grades, which are coming forward more freely, a good b has been transacted, parcels giving a good infusion fetchi previous rates, but those showing any deficiency in charac ing at a slight reduction. Common teas, mainly consi Sylhet and Cachar growths, were but moderately bid for many cases lower quotations were established. If a contin large supplies of these kinds arrive, and judging from the reports this is likely to be the case, a still lower range of pric be expected. The quantity of Ceylon tea brought forward ha been large, but the supplies continue to be well taken by th and no adverse effect on prices was noticeable, former rat well maintained for all the lower grades, while the medi better sorts were difficult to obtain except at an advance. Pekoes showing a little extra colour in cup were much soug and the few parcels on offer met with keen competition and extreme prices. Inquiry for the finest grades still contin high rates are freely given for any teas of showy appearance less of real quality in liquor.

PLANTING IN THE WEST INDIES.

Steps are being taken in some of the West Indies to rep sugar industry. In St. Vincent, cocoa planting is making headway, tobacco is grown with success, and there is a local for the beginners; coffee cultivation is gradually increasi arrowroot and cassava starch are grown with profit. In so of the Colony of Grenada, cocoa and coffee promise well.— *Mail.*

GAINERS BY LOW EXCHANGE.

Mr. Robert Gompertz was the first critic of our recen on "Gainers by Low Exchange." His ideas are revealed i lowing extracts:—

So long as the rupee retains *in India*—as it does at p much the same relative value with regard to Indian that it always has done, I maintain that *it is* a *most* absurd to ask producers whether a two-penny rupee (if such a thi reasonably possible) would be more profitable to them tha rupee. In other words, whether they would rather hav hundred or twelve thousand rupees for their £100 worth

Apply "Observer Office,"
Colombo.

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

nd I see no reason why, if Government would cease to tamper with , the value of silver (or even of the rupee) in India should be much ore seriously affected by the price of gold than by the price of amonds . . . . *Planting Opinion* wants "an explanation" of the fact at whereas a 16*d.* rupee represents a tax on producers of 40 per nt., nothing like a tax of 40 per cent. on exports has ever been sug-ested to meet the deficit that a natural rupee would cause. The xplanation is extremely simple. The exports are worth about 108 rores of rupees; the loss to Government would be about 15 crores. tax of about 13½ per cent. on 108 crores would be sufficient to ake up this loss; and the whole of the 40 per cent. tax at present vied now goes into the pockets of the silver-using countries who ompete with the Indian producer. It is more than probable that, as *lanting Opinion* prophesies, Government would step in at the next ssessment, and deprive producers of excessive profit. It is right nd just that it should do so. The export duty would then be emoved; and if Government took its share of the profits no one ould have a right to complain. All classes would benefit by a ealthy and prosperous Government. The permanent settlement as a mistake, but it has been generally considered irretrievable. nother terrible mistake, which happily is *not* irretrievable, is that ome people will treat silver and gold as if they were on a totally ifferent footing from all other commodities. If it were but generally dmitted that Government had no more right to attempt to fix the gold) price of the rupee than that of the quartern loaf, I think we hould be within measurable distance of the solution of the great xchange problem.

An "explanation" of this sort is to our minds a mere *ipse dixit,* nd, as such, not worth discussion apart from other phases of the urrency question. For the rest, if Mr. Gompertz means, as his ords would imply, that gold and silver, even while used for currency urposes, should be regarded as entirely on the same footing as other ommodities, discussion of the Currency question with him could carcely lead to a result satisfactory to either party. He does not, will be noted, give any idea of what he thinks might be regarded s the probable *minimum* value of the rupee, for purposes of rgument, nor, while dismissing the permanent settlement as an retrievable mistake, does he consider our suggestion that to allow xchange to stand at a very low level might be to intensify that istake very seriously, and to multiply the losses it has un-uestionably inflicted upon the Government.

"Observer" has also stated that he does not agree with us, but it s difficult to understand why, for he starts by saying:—"The uestion of the currency of a country is on a much wider basis than s effects upon any particular class of the community." That is xactly what we sought to show, among other points. "Observer" eclares that "under a depreciated rupee the country gained," but e submits no proof, no evidence. His remarks about the "balance of rade," as it is usually called, are of a character to provoke ridicule on he part of the modern school of political economy. Letting that pass, owever, we need only remark that if "Observer" can prove that the ainers by low exchange are the people, or what our correspondent erms "the country," it seems to us that he will at the same time stablish another of our points, viz., that the gain made by the people enerally is in the case of holders of land under the Permanent ettlement enormously enhanced. If "Observer" does not agree ith us in this, his explanation would be of very great interest to us nd, in all likelihood, to many of our readers.

THE JAVA QUININE FACTORY.

AFTER writing on this subject in our last issue, we came across an rticle in *The British and Colonial Druggist* that confirms much f our remarks, and explains some points on which we have merely touched. It should have been reproduced in the same issue as our remarks, but was unfortunately held over by the printers. Our contemporary writes:—

Mr. Van Prehn, who has the technical control of the Bandœng quinine factory in Java, has addressed a letter from the Hague (where he has been staying during a part of his sojourn in Europe) to the director and board of the Company owning the factory, protesting against the treatment he has received. His letter throws light on recent events in Java, and will be taken by some as another piece of evidence in support of the theory that the Dutch cinchona planters will never be able to agree on a scheme for their common protection. Whilst Mr. Van Prehn has been in Europe trying to come to an arrangement with the German quinine makers, his conduct in other respects has been severely criticised in Java. We will give extracts from his letter, which will reveal the state of affairs between the various parties.

Mr. Van Prehn says:—

I was affected in a most painful manner on learning the numerous complaints and reproaches cast at me insinuating that I had acted, and was still acting, in opposition to the true interests of the Bandœng quinine manufactory. On numerous occasions, Mr. Van Heeckeren, in consultation with myself, drew up sundry draft contracts and distributed them amongst the cultivators of cinchona bark; according to the terms of these contracts, the latter were invited to undertake to deliver yearly a certain quantity of cinchona bark to the Bandœng quinine manufactory for the purpose of having quinine manufactured therefrom.

The producers, however, found they could not agree to the terms of (the last) contract, and consequently we do not receive a single offer. Many of them were unwilling to agree that these quinine should be consigned to a firm nominated by the Bandœng quinine manufactory without any consultation on its part as to the wishes of the owners of the quinine. I was, moreover, unable to agree to the compulsory obligations which it was sought to impose upon the planters. Besides these, there were several other conditions which did not suit the interests of the producers. As a rule the sale outright of the raw material was preferred to the manufacturing of the same against payment of a stipulated price, with settlement at the end of the working year. Even the offer of an advance of 8 florins per kilo of sulphate of quinine had no attraction for them. Many would have nothing to say to an advance, and demanded earlier and quicker settlements. That several planters accepted this advance was entirely owing to my efforts. I saw that it would happen that many planters after the first trial consignment would send no more cinchona bark to our factory, especially when a rise in the price of the bark clearly showed that the sale in the form of bark in Amsterdam was to a considerable degree more profitable than the manufacture in Bandœng with subsequent delayed settlements. Besides all this, reports were circulated that others proposed to establish factories to compete with the Bandœng manufactory and which would buy the bark. I allude to the Pengalengan manufactory, which declared that it had a million florins disposable wherewith to buy bark, and pay for the same on the spot.

Another project was that of Mr. Van Meeverden, who was already in correspondence with, and in negotiation with Mr. Henny, of Batavia, with the idea of

BUILDING A QUININE MANUFACTORY,

and of buying the bark. Under these circumstances our Bandœng manufactory, with its scheme of manufacturing for a stipulated recompense, could not continue to exist.

The scheme was a source of unceasing remonstrance and complaint; first one about a difference in weighing the bark, then another about the result of the analysis, and yet another about the time of settling and the pecuniary circumstances. For example producers who had given in their bark when the price was six cents were not very well pleased with a final settlement on the basis of a lower average price, &c., &c. The scheme when in operation was both unsatisfactory to the manufactory, and aroused dissatisfaction and complaints with the producers. I thought, and I am convinced, that I acted in the interests of the manufactory when I made, with a few favourably-inclined and independent planters, arrangements which enjoyed their favourable consideration.

I will refer to a paragraph which can be read in the circular of Messrs. Kerkhoven and De Vries:—

"Three-fourths of the cinchona produced by Java will go in the usual manner to Europe and be manufactured there into quinine for the consumption of Europe, America and Africa. The remaining fourth part will be manufactured in Java for consumption in Asia

and Australia, &c." When one of the Messrs. Kerkhoven asked me what I wanted for myself, I replied that I did not stipulate for anything for myself, and I only solicited their co-operation in order to save the shareholders in the Bandœng quinine manufactory from loss and injury. I have chosen to enlarge thus upon this matter, because a fourth part of the early production of cinchona bark in Java represents twice as much quinine as the factory can at the present time turn out in a year.

Thus I succeeded in rendering all competition on the part of others in Java impossible, because during the period the factories were in course of construction there would be no occasion to buy any bark, and at the same time the Bandœng manufactory secured an ample supply of the raw material and a ready market, free from competition, for the manufactured article in Asia and Australia. With a view to extending the factory, a larger site had to be looked for, especially as many complaints were forthcoming with regard to the pollution of the water that flowed through the towns, and was injurious to the fish-ponds.

It is my firm conviction that the plan, according to which the working of our factory is carried on, is not a plan conducive to the interests of the producers, and, as a direct consequence, is likewise not conducive to the interests of the shareholders. Now what is

THE ACTUAL STATE OF AFFAIRS?

The manufacturers of quinine, who will be only too pleased if they can succeed in rendering the manufacture of quinine in Java an impossibility, have recently raised the price of the cinchona bark, and lowered the price of the manufactured quinine to such a degree that the producers find it more to their advantage to sell their produce in the form of bark than to have it manufactu Bandœng, and then to sell it in the form of a preparation manufacturers can always effect this with loss, or, at any without only a slight loss for a short time. Planters naturally to send their bark to Europe, and our factory without a supply necessary raw material must necessarily cease to exist, after the manufacturers are masters of the situation, and the pro are ultimately the victims and bear the loss.

Mr. Van Prehn concludes by saying the Bandœng factory not cease to exist, but must rather be enlarged and furnishe the very best machinery, as well as with an expert special manager, so as to manufacture as well and as cheaply as in E The factory should pay for the raw material at a price corres ing to the prevailing price of the sulphate of quinine, an cinchona producers should possess at least half of the shares factory.

Since his return to Europe he says he has done much to f the interests of the factory and of the producers, but he canno will not, publish what he has already done and effected i direction, but he says that he has every reason to be satisfied wi results obtained.

He says he is in a position to declare that his efforts to im the condition of the producers and to maintain the life o Bandœng manufactory have not been without success, tha the co-operation in the Netherlands of sundry parties interes the cultivation of cinchona.

For all these reasons he asks that the vote of censure shou withdrawn.

CEYLON TEA COMPANIES.

Extracts from Reports.

The Putupaula Tea Estate Company, Limited.—Tea in full bearing, 421 acres; tea in partial bearing, 36 acres; tea in new clearing for Para and tea, 4 acres; Liberian coffee and Para 10 acres; forest, grass, &c., and waste land, 228 acres—grand total 699 acres. The crops amounted to 162,113 lb. tea against an estimate of 170,000 lb. The nett average price realised was 34·63 cts. per lb.

The season has been an unfavourable one for tea, the bushes suffering greatly from drought in the early part of the year. The short fall in crop must further be accounted for by the necessity of having to allow certain fields to run on without pruning to equalize pruning periods. No manuring operations have been carried on during the past season, but it is proposed to treat 50/100 acres this year.

The Directors arranged for a loan of R15,000 bearing interest at 7 per cent., allowing, as security for repayment, a mortgage over the Company's property to be executed. The nett profit for the year amounts to R14,154·64 and with the balance brought forward from last season, the balance at credit of Profit and Loss account amounts to R21,941·58. The Directors recommend that a dividend of 7 per cent. be paid absorbing R14,000. R4,000 be placed to reserve fund, and the balance R3,941·58 be carried forward. The estimated crop for the current year is 175,000 lb. on an estimated outlay on working account of R38,618.

The Doomoo Tea Company of Ceylon, Limited.—The quantity of tea received from the two estates was 205,902 lb. against 170,000 lb. estimated, and the price realized for that sold was 43·13 cts. per lb. against 49·43 cts. last year. During the year an interim dividend of 3 per cent. was paid absorbing R12,000·00, and after writing off R1,745·82 for the remaining balance of preliminary expenses and transferring R2,500·00 to depreciation account, there is a sum of R14,400·01 available. This amount the Directors recommend being disposed of as follows :—That a final dividend of 3 per cent. (making 6 per cent. for the year) be paid on the capital of the Company, absorbing R12,000·00 and that a balance be carried forward of R2,400·01. Total R14,400·01. The estimate of crop for the current season is 220,000 lb. tea and the estimated expenditure is R72,946·00, which includes a sum of R6,500·00 allowed for cost of new machinery and factory alterations on Verellapatna. The acreage of the two estates now stands as follows :—Doomoo— 210 acres tea 5 years old and upwards, 3 acres tea 2 years old and upwards, 28 acres timber, and 58 acres grass land. Total 299 acres. Verallapatna—310 acres tea 5 years old and upwards, 35 acres tea 3 years old and upwards, 120 acres tea 2 years old and upwards, 35 acres tea 1 year old and upwards, 24 acres under 1 year, 10 acres grass land, and 154 acres waste and chena, Total 688 acres.—The dividend of 3% recommended was declared.

The Alliance Tea Co. of Ceylon, Ltd.—The Agents and Secretaries in Colombo have received a telegram from London stating that the Company have declared an interim dividend of 3 per cent.

COFFEE PROSPECTS IN LONDON.

A steady market is again reported from London, with auctions consisting mainly of ordinary and low middling qualities, which realized about previous rates. As regards future prospects, a London trade paper recently made the following interesting remarks :—

In one of our recent issues we gave a short report on the prospects of the growing crops on the Malabar Coast of India. The communication we had to convey has apparently met with some interest, for we have been asked by several members of various branches of the East Indian trade to keep them well posted with regard to developments in those districts in which they were particularly interested. In compliance with their request we are to-day in the position to state that we have since received full confirmation of the unfavourable reports regarding the strength of the monsoon to which we have recently given circulation. It appears that the monsoon has been very unsatisfactory in every respect, but particularly some, and, we regret to say, the principal, coffee growing districts have cause to complain bitterly at the unfair behaviour of God Pluvius. He has apparently raised the hopes of planters at the beginning of the season in order to dash them to the ground about a month later. The splendid blossom of the coffee plants promised a brilliant yield, when just at the critical moment sharp showers—showers as they are only known in the tropics—practically ruined the crop. Especially Munzerabad, the principal district for native coffee, appears to have suffered severely, and as the principal supplies are drawn from that part, a crop failure there must necessarily affect the whole East Indian coffee crop. The Mysore districts appear to have experienced a little more luck, although they have not altogether escaped, the reports from there sound less gloomy than from Munzerabad; a fair Mysore yield, unless something unforeseen happens, may be expected. To form an estimate at this time of the year is necessarily very difficult, and therefore somewhat unreliable, but taking all the circumstances into consideration our Indian reporter considers an estimate of Native Coffee from North Coorg, Munzerabad and Mysore, of about 3,000 tons not excessive; in fact he is inclined to fix this figure rather as the maximum, and fears that as the season progresses lower estimates will be forthcoming. Last season happened to be a particularly unfavourable one, and then the total yield in the above-named three districts amounted to 2/2,500 tons only. South Coorg and Wynaad are expected—as far as it is possible to judge now—to total about 10,000 cwt. Small supplies, stiff prices, and we fear very little business, will be result of the unsatisfactory state of affairs in India. Had the London Coffee market maintained its strong position and 'bull' fever, the exorbitant ideas of Coffee planters on the Coast would have had a chance of being realised, but since 'bears' have superseded 'bulls' again in Rios and Santos, the outlook for a good business in fine coloured East Indian has become more gloomy. The possibilities of a Brazil crop of 8,000,000 bags we fear, are hardly favourable to a strong 'bull' movement, although prices are low, but a crop of 8 millions looks small at the side of the last yield of 10,500,000 bags. A great deal will depend upon the prospect of the next Brazil crop.

IRRIGATION AND FERTILISATION.

Writing from Inverness on "Periyar and Kurnool Irrigation," "A.T.F." makes in the *Madras Mail* some remarks that will interest planters. He says :—

The London Press had predicted that something startling would appear in Sir William Crookes's Address at Bristol as President of the British Association, and such turns out the case. Only no one would have thought the discoveries referred to are likely to cause a revolution in the financial prospects of two very important Madras irrigation works, namely, the Periyar Scheme and the Kurnool Canal. Grain crops depend for full ears and their starch and albumen on a due supply of "fixed" nitrogen in the soil. In fact, as the Address says, "the fixation of nitrogen is vital to the progress of civilised humanity." Everyone can see the pains the natives take to plough into the rice fields the leaves and organic substances which are to furnish nitrogen; and in European countries nearly a million and a quarter tons of nitrate of soda (worth £7 10*s*. per ton) are imported from Chili and put on the land, without the use of which the price of bread would rise. But the respite to civilisation is temporary, as after thirty years the Chili nitrate beds will be exhausted. There are, however, seven tons of nitrogen resting over each square yard of the earth's surface, and therefore there is a

Proprietors, "PLANTING OPINION,"

Nos. 16 and 17, Armenian Street, Madras.

vast store of it in nature. But it is slow work oxidising the nitrogen by the familiar processes of decay, and rendering it fit to be absorbed at the roots of plants. The chemist can now do it at once. Sir William Crookes in 1892 exhibited to the Royal Society a flame of nitrogen which had become combustible as the jet of gas passed between terminals conveying a strong induced current of electricity. The product of combustion is of course nitric acid with which "nitrate" can be prepared. Wherever there is water power electricity can be generated at a very cheap rate, or about 4 pies per "Board of Trade unit," which is $1\frac{3}{10}$ horse-power working for an hour. As the Periyar gives upwards of 5,200 such units hourly on the data of Sir W. Crookes's Address, nine tons a day of nitrate of soda could be manufactured at the foot of the Pulney Hills; or 3,000 tons a year, enough to give twenty-four thousand acres a full dressing of $2\frac{1}{2}$ cwt. per acre, value £22,500, and a windfall for the cultivation under the Vaigay in Madura. In the case of the Kurnool Canal, there are 44 locks with a drop of 10 feet at each, disposing of a large volume of irrigation water, carrying power through a length of 200 miles with additional sources of power at the head works and anicuts. The horse-power of all this has never been calculated out, because it was so improbable that it would have any commercial value in a near future, nor did the wildest imagination ever conjecture that it could be turned to account in fertilising the land the water irregated. There can be little doubt that before long the marvellous secret of how the passage of induced electricity lowers the combustion point of nitrogen, a gas that puts out flame rather than otherwise, will be penetrated. Means will be found to effect "fixation" at less expenditure than of 14,000 Board of Trade units to produce a ton of nitrate. There is consequently an era of great prosperity in store for our Irrigation works that have the water power able to supply the irrigated land with what Sir William Crookes calls "the dominant manure," and which will make the "low acre field" now so prevalent over the grain fields rapidly disappear.

CHINA'S COMPETITION.

Telegraphic advices from Calcutta, under date 6th instant, state:—

An important letter has been addressed by the Secretary, Bengal Chamber of Commerce, to the Bengal Government, asking the latter to depute an officer to proceed to China to make enquiries regarding the effect of the fall in the value of silver on production and prices, and the effect which this may be expected to have on exports from China in competition with those from India. The Committee has been led to prefer this request owing to the difficulty it has experienced in getting reliable up-to-date information regarding prices and wages in China, and the effect of the fall in the price of silver in respect to articles which come into competition with exports from India. The letter refers in strictly judicial terms to the serious fears entertained by some of those who gave evidence before the Indian Currency Committee that great and increasing injury was likely to be sustained by the tea industry in competition with China tea owing to the alleged advantage China has over India on account of the fall in the gold value of silver. After laying down the main lines on which the proposed enquiry should be conducted, the Chamber suggests that Mr. Frederick Atkinson, of the Financial Department, is a suitable officer to carry out the proposed enquiry.

The *Madras Mail* has the following interesting comments:—

It will be seen from a telegram we publish to-day that the Bengal Chamber of Commerce has written to Government asking it to depute an officer to proceed to China to make enquiries regarding the effect of the fall in the value of silver on production and prices, and the effect which this may be expected to have on exports from China in competition with those from India. The Bengal Chamber has been led to prefer this request owing to the difficulty it has experienced in getting reliable up-to-date information regarding prices and wages in China, and the effect of the fall in the prices of silver in respect to articles which come into competition with exports from India. After laying down the main lines on which the proposed enquiry should be conducted, the Chamber suggests that Mr. Frederick Atkinson, of the Financial Deparment, is a suitable officer to carry out the proposed enquiry. Apparently, however, the selection of Mr. Atkinson is not viewed with general favour in Calcutta. The Calcutta commercial correspondent of the *Pioneer* writes:—

Instead of selecting some one with commercial knowledge, they h am told, chosen Mr. Frederick Atkinson, of the Indian Financial Depart who is doubtless an able statistician, but is also a currency theorist. would have thought that commercial men had had enough of Gover statisticians in connection with currency matters. Doubtless Mr. A son could compile a very interesting statistical statement of China but is there any need that he should journey to China for this pur The mere fact of Mr. Atkinson's presence in China will not afford u more statistical data than already exists there, and this he might obt writing to the Chambers of Commerce and the various British Consu Further, the proposal to send Mr. Atkinson to China has, I be emanated from that section of the Chamber which is at present endea ing to persuade those interested in tea that an artificial one and four- rupee is not detrimental to the tea industry, and that that industry nothing to fear from competition with China—views which I am tol Atkinson also holds. However, it appears that application has al been made to the Government of India for Mr. Atkinson's services, I would be interesting to know if the Tea Association, apart from Sir Pa Playfair, are prepared to support or even to approve of Mr. Atkin mission to China.

That Mr. Atkinson is the best man available, or even that he suitable man for the task, we refuse to believe. Even by tho his own department he is not, we understand, looked upon as a reliable critic in economical and financial problems. Further his papers on "Prices in India" which we have recently reviewing in these columns contain so many inaccuracies, omis and erroneous deductions that his capabilities for the impo mission proposed by the Bengal Chamber of Commerce mus placed in serious doubt.

AN OPENING FOR INDIAN TEA.

It was probably never imagined that the Pomeranians especially a community of tea-drinkers. That was not the favo beverage of their illustrious patron who manifested such solici at a critical juncture in international politics, for the bones single Pomeranian grenadier." It is not a little surpri nevertheless, to be reminded that in the sturdy north-ea province of Germany tea, both as to cost and consumption, occ much the same place as it held among our forebears in the f days of Queen Anne. It is only of recent years, according t Consul at Stettin, that the cups which cheer but not inebriate captured the palates of the Pomeranians and their neighbours i ancient seat of the Prussian Monarchy. "There can be no do writes Mr. Consul Powell at Stettin, "that the taste for tea is increasing in this and other parts of Germany." Is the development carried on at the expense of lager, or schnapper, o mysterious distillation denominated as "loco spirit?" What ex is "loco spirit?" Has it anything to do with a hindrance o undue facilitation to locomotion? The year 1897, says Mr. Po began briskly for spirits, although only small supplies were off in the open market. It would seem, therefore, that tea has no supplanted spirits, "loco" or otherwise, among the rank and fi the populace.

A consular report, however, is nothig unless it be in some p informing and didactic. The days of Pope and Addison, and p cularly Dr. Johnson, with their dishes of tea, are again recalle the statement that the cost of the commodity in Stettin and neighbourhood restricts its use to the w ealtheir classes. It s incredible, when one considers the means of over-sea communic with the East, that the teas used in Pomerania are "mostly ca teas, imported from Russia." There can be little wonder that are limited to the use of the more opulent people when our C informs us that the prices range from 6 to 10 marks, or from 5*s.* to 9*s.* $10\frac{1}{2}$*d.* per lb. On this point Mr. Powell is usefully sugge and his remarks may be commended to the careful attentio Mincing-lane and its offshoots. "I am of opnion," he writes, " there is an opportunity for the introduction of Indian and Ceylon to this market—in the first place, because they are cheaper and ter than at present available; and, secondly, because as the tas so to speak, in its infancy, the liking for the more highly-flavo growth of India may be easily introduced. I understand, goes on to say, "that the cost of the retail price being so high consequence of the very limited demand and the length of time the tea is kept in stock before being sold. He is convinced, ever, that if a good tea, at a reasonable price, could be put upo

Pomeranian market, with a suitable agent to push the sale, the business would soon find considerable extension. There would be little difficulty as to the Customs rates. The duty on tea is charged at 50 pf. (6*d.*) per pound; thus a good tea could well be introduced here at a retail price of 3 marks (2*s.* 11½*d.*) per pound, or even less, with a considerable profit to the merchant." Then follows a pregnant saying: "The tea at present here sold at 3 mark (2*s.* 11½*d.*) per pound is not fit to drink, and it is doubtful whether it is tea ot all." But it will not be sufficient for a merchant merely to appoint an agent at Stettin in the hope of making business. It requires the service of a competent man, so Mr. Powell advises, who would create the business, as he must find his first customers among private families, "and he should be content to make a quite small begnning, which, as far as my present knowledge goes, would gradually create a taste for the teas of India and Ceylon."

Tea naturally suggests coffee, and coffee has hitherto rivalled spirits as the drink of the commonalty in the late Prince Bismarck's pet country. The imports rose from 77,306 metre-centners in 1894 to 82,950 in 1897. But last year resembled its predecessor in its unsatisfactory results to all concerned in the coffee trade. There is nothing new to readers of produce market reports in the announcement that the large crop produced in Brazil during the last two years knocked prices beneath respectable recognition, or anything like an acceptabe return on the capital employed in the industry. Yet, with tea missing and coffee unprofitable, it is evident that the United Kingdom has little to complain of in regard to its share of the trade of Stettin last year. The sea-borne imports to the Pomeranian entrepot amounted to 2,279,625 tons, the exports therefrom to 707,044 tons. Of this aggregate, although the tonnage of other nations collectively showed a decrease of 120,813 tons, British tonnage marked an increase of 22,002 tons. Similarly in respect of coal, for Mr. Powell's figures are not affected by the stupid South Wales strike. Great Britain exported to Swinemunde and Stettin 929,622 tons in 1897, as compared with 930,992 tons in 1896 and 837,437 tons in 1895 —*Financial News.*

THE CULTIVATION OF COFFEE IN INDIA.

THE following Report on Coffee Cultivation in India has been issued by the Director of Statistics to the Government of India:—

Area.

At the end of 1897 there were 276,074 acres of land under coffee in India, all, with the exception of 524 acres, in Southern India. The cultivation of coffee is in fact restricted for the most part to a limited zone in Mysore, Coorg, and the Madras Districts of Malabar and the Nilgiris. In Mysore there are 125,876 acres, in Coorg 86,155 acres, and in the Nilgiris and Malabar 38,201. If to these are added 7,624 acres in Travancore and Cochin, we find about 93·4 per cent. of the coffee-bearing area of India concentrated in the elevated region above the south-western coast where the rainfall is heavy and the climate generally approximates to that of the coffee-bearing area of Ceylon.

In the Madras Presidency coffee is not grown to any extent except in the two districts already mentioned, and in Salem and Madura. The only other Province in which coffee is grown, except experimentally or in trivial quantities, is Burma, and the cultivation there, which is mostly in Toungoo, is of recent origin and very limited in extent.

The area in Madras has contracted greatly in the last two years. In Coorg there has been a greatly expanded cultivation since 1894; in Mysore there has been a steady and considerable increase from 1889, the year in which prices took an upward turn, to 1896; but in 1897 there was a large decrease in the area under mature plants which is attributed to the dying or removal of old plants owing to their unproductiveness. Travancore and Cochin show some advance in 1897, but in the former state the cultivation of tea appears to be found more profitable than coffee-growing.

The largest part (nearly half) of the area under coffee is in Mysore; there is 31·2 per cent. in Coorg, and 20·3 per cent. in Madras.

Production.

The yield in 1897 was slightly in excess of 24 million pounds, being 7·8 per cent. lower than in 1896 and also lower than that of every other year since 1885 with the one exception of 1890. In Madras there was on the whole a slightly larger yield on a smaller area in 1897 than in 1896. In the Nilgiris there was a large apparent increase which is attributed to the planters having furnished complete returns, but there was a great falling off in Madura, Tinnevelly, South Canara, and Malabar, owing to want of sufficient and timely rain and to leaf disease. Want of rain and a reduction in the area planted also account for the very small crop in Mysore, which is less than one-fourth of the 1893 crop. In Coorg, where the outturn is calculated from an estimated yield per acre, the crop was better though still poor, and Cochin and Travancore also show better results.

Taking 100 to represent both area and production in 1885, the ratio of yearly increase or decrease is shown in the subjoined table:—

	Area.	Production.		Area.	Production.
1885 ...	100	100	1892 ...	110	97
1886 ...	97	90	1893 ...	109	109
1887 ...	103	109	1894 ...	117	101
1888 ...	104	76	1895 ...	119	115
1889 ...	110	85	1896 ...	121	75
1890 ...	114	63	1897 ...	116	69
1891 ...	111	113			

In 1897 the yield varied enormously in the different localities, the tables giving 512 lbs. in the Nilgiris; 369 lbs. in Burma; 142 lbs. in South Canara; 50 lbs. in Mysore; 98 lbs. in Coorg; 37 lbs. in Malabar.

There is doubt as to the accuracy of some of the returns as the planters are not always willing to give information.

Persons employed.

According to the returns there were, in 1897, 37,819 persons permanently, and 95,820 temporarily, employed on the coffee estates, making a total of 133,639 persons, which is equal to one person to 206 acres.

Exports and Consumption.

The following figures are the average of the five years ending 1897-98:—

Indian Coffee,	Production ... ...lbs.	32,748,344
	Exports ... ... „	28,822,954
	Left in India ... ... „	3,925,390
Foreign Coffee	Imports ... ... „	1,361,024
	Re-exports ... ... „	859,062
	Left in India ... ... „	501,962

It appears, therefore, that 88·01 per cent. of the production is exported, and that of the coffee consumed in India foreign coffee represents only about one-eighth the quantity of Indian coffee. The rate of consumption is about 0·015 lb. per head of the population.

The principal consumers of the 25,200,896 lbs. of Indian coffee exported in 1897-98 were:—

United Kingdom ... ...lbs.	12,773,376
France ... ... „	8,607,872
Asiatic Turkey and Persia ... ... „	863,856
Arabia ... ... „	630,896
Austria-Hungary ... ... „	591,360
Germany ... ... „	297,584
Ceylon ... ... „	293,888
Australia ... ... „	199,024

Prices.

There is no trustworthy or complete record of the prices in India of Indian coffee. The prices in London, in February of each of the last twenty-three years, of coffee (East India plantation) are here subjoined:—

	Per Cwt.		Per Cwt.
	s.		*s.*
1876 ...	100 to 116	1888 ...	74 to 95
1877 ...	107 to 122	1889 ...	87 to 110
1878 ...	96 to 122	1890 ...	97 to 110
1879 ...	91 to 112	1891 ...	102 to 115
1880 ...	94 to 115	1892 ...	101 to 112
1881 ...	75 to 108	1893 ...	105 to 118
1882 ...	62 to 105	1894 ...	94 to 109
1883 ...	60 to 106	1895 ...	96 to 112
1884 ...	68 to 103	1896 ...	95 to 110
1885 ...	54 to 95	1897 ...	98 to 115
1886 ...	54 to 105	1898 ...	75 to 93
1887 ...	75 to 95		

Ten years, from 1879 to 1888, of depressed prices, combined with the havoc wrought by the borer and the leaf disease, greatly discouraged coffee-planting in India and Ceylon, and the prospects of the industry seemed so forlorn that both in Ceylon and India much coffee land was placed under tea. In 1889, however, there was a sharp rise in prices, and the level has ranged high since that year under the operation of speculative corners, political troubles in Brazil whence the main supplies of the world are derived, and other circumstances. In 1896 prices receded to a lower level, owing principally to reports that the Brazilian coffee crop would be the largest on record; and after rising in 1897 they again fell greatly this year owing to the enormous quantities of Brazilian coffee which have been thrown on the market.

THE TEA INDUSTRY IN INDIA.

How to Make a Garden Pay.

[By Sirocco.]

I Have to thank "H. C." for his comments (in issue of 25th June) on my first letter, and also for the *pukka* information given. He shows clearly that some few concerns have still a large margin, others have enough life to keep up even a severe struggle, while the bulk of tea investments are decidedly shaky.

Exchange cannot go against us for long unless the rise is *bonâ fide*. If it is bolstered up by any interests, however powerful, it is impossible for our nation to permit any lengthened run of injustice. And if exchange is in its legitimate state and remains high, we shall find means to counterbalance the odds against us. But this is all outside my province. I know the bush and the cooly and the practice of tea, and I say that we have much room for improvement.

With new conditions we must change our customs and throw prejudice overboard. "Prejudice" I take to be the collective experience of former days. In the matter of plucking tea leaf we *must* change our systems because the conditions are changed.

Up to the present year medium leaf would pass muster and pay for its manufacture. Now there is so much tea made that medium leaf will make about an average of 5 annas, which barely pays expenses. And so for a time those who wish to pay expenses (let alone making a profit) *must not* pluck medium leaf. Any tea that will *pay* this this year (of 1898) must be strictly of two leaves and the bud. Admitting this to be true, the bulk of planters will give up all hope of making tea pay. It was not until I gave up here myself (some four years ago) that I found out the way to make my garden pay. I got desperate, I "plucked fine" and I succeeded. But I had to heave overboard my old prejudices, founded (as I said above) on my experience of twenty years, and the universal custom of tea planters.

And now I will tell you how to pluck fine leaf, and yet get nearly the same yield as if you plucked medium or coarse leaf. You must abandon the idea that it is *necessary* to leave one leaf on the shoot plucked, in order that it may send out a new shoot from its axil. My system is to leave a good growth after pruning, and after that *to take every shoot right off at the root as soon as it has got two leaves and a bud*, and it is necessary to pluck round the estate in five days, beginning again on the sixth day. Going round in four days will give better results, but very few estates have sufficient labour to do this. You must divide your estate into five equal blocks, estimating the yield rather than the area. Thus you have—

No. 1	plucked on Monday.	No. 4	plucked on Wednesday.
„ 2	„ Tuesday.	„ 5	„ Thursday.
„ 3	„ Wednesday.	„ 1	„ Friday.
„ 4	„ Thursday.	„ 2	„ Saturday.
„ 5	„ Friday.	„ 3	„ Monday.
„ 1	„ Saturday.	„ 4	„ Tuesday.
„ 2	„ Monday.	„ 5	„ Wednesday.
„ 3	„ Tuesday.		

Each day the block appointed for that day must be finished. The pluckers can take any leaf shoot, but they must leave the one leaf shoots, and if by chance a shoot has been skipped before and has four leaves on it, two leaves must be left. You will find in practice that because *very many* shoots are skipped there are quite enough axils left to give continuous flushes, and if by design no axils have been left, and the bush wants to grow, it will force a new sho from the same axil as the one that was removed. I cannot that many will have sufficient courage to adopt this plan o whole estate, but it is really the only means by which a mode well-founded estate can hope to keep afloat. I am, techn speaking, advising planters to "overpluck" their gardens, hold that it is impossible to really overpluck unless you have three pluckers per acre. If your bush is covered with leaf, yo safely remove every new shoot as it appears, and so give it growth after pruning; and after that take all you can get.

The salient point and advantage of this system is that you d hamper your pluckers. You can safely leave them unguarded a if you examine their baskets at the tea-house door to see tha have taken no old leaf, no one-leaf shoots and no bhanji s The weight of good leaf brought in will tell you whether they worked hard or lazily.

Under the present system (I exempt Kangra and other up-co gardens) the cooly has to examine each shoot, and has to be c to have one leaf (at least), and this hampers them so much tha cannot work freely. Remove this restriction and you will fin they will bring in nearly as much absolutely fine leaf as they do of medium leaf. You bushes will grow in spite of you days, *puja* days, &c., will put your plucking back and you will to leave a leaf on the shoots. When a *puja* is coming on you s pluck round in three days, taking only the best leaf, thus incl the two holidays and beginning the new round on the prope There are numerous advantages in my plan. The pluckers get efficient when they find that you press them for leaving too leaf rather than for taking too much. If you go round in five the leaf has not time to get too long. Long shoots are the exce and so it is nearly impossible for the pluckers to find any ol You get also several more rounds of plucking in the year. need not look at your bushes—you regulate the plucking at th house door; if on going round you see that your force is una take off all the ready leaf, you must put on the men and boys. a fairly vigorous garden and a good labour force, it will n necessary to take a single open or *bhanji* shoot all the year r These open shoots give the bush all it wants in the way o returned to the stem and branches. The greatest benefit c obtained from this system by leaving the bushes unpruned fo year, *i. e.*, two years between each pruning, because hard pluckin begin in February and continue to December in the second ye growth. I think that this accounts for the large yields in Cey

Briefly, the orders should be to pluck every shoot as soon as ready, to abandon everything more than two leaves and a bud, not to take open shoots. Leaf like this will make good tea, a will take less withering space. If you want really perfect leaf, very large force and pluck round in four days; this would mak best of tea. If you can't get enough labour to get enough good then abandon a part of the estate, cut down supervision, both N and European, and hang on in hopes of better days. My idea is the universal adoption of this system of plucking will give a sli reduced outfit: sufficient in itself to check the fall in prices. quality will be so much improved that our tea would force open markets and oust all competitors, and then we shall settle down steady 10 to 8 per cent. All the bad properties will have imp or closed up, and the returns from tea will not be sufficiently bri to induce the present exaggerated competition. I have given ideas, at much risk to my reputation for sanity, with the ho showing investors that we planters are not at the end of our re ces, and that concerns not yielding much return now may pos be brought to give good profit even if there is no rapid rise in p For planters we must have a new maxim: "Hard leaf is better o bush than in the tea-house." The third leaf now is poison to prices. Don't hamper your pluckers. The bush will yield all can take if you let them take it unconditionally. I would investors to question us in your columns. "H. C." and mysel give two views; he will show all that we have to fear, and I show all that we have to hope for. I know planters and tea so that I am sure that we can weather this storm, and that all wh will fail for want of "management" and not because "tea" is a last gasp.

I am prepared to reply to any theoretical opposition, becau give advice from "practice" carried out successfully for several y My bushes improve year by year, and I have absolutely no tr with my pluckers.—*Pioneer*.

DISTRICT ASSOCIATIONS.

WYNAAD.

Proceedings of a General Meeting held at Meppadi on 7th eptember, 1898.

Present.—Messrs. H. Atzenwiler, E. H. F. Day, A. C. Glenie, . W. Hockin, R. Lamb, W. Mackinlay, D. Mackenzie, J. S. Malcolm, . S. Nicolls, G. Romilly, S. Robinson, M. D. Taylor, H. Waddington, nd E. deFonblanque (*Honorary Secretary*).

Chairman.—

Read letter from Mr. R. K. Walker resigning the chairmanship wing to his having to leave for England.

Proposed by Mr. H. Waddington.

Seconded by Mr. H. Atzenwiler.

That Mr. Hockin be elected Chairman during Mr. Walker's bsence. Carried.

Proceedings of last Meeting.—

The Proceedings of the previous meeting were taken as read.

Sultan's Battery Post Office.—

Read letters from the Postmaster General, Madras. Recorded.

Pudu Padi Hotel.—

Read letters from Mr. T. J. Ferguson.

The Secretary was requested to write for further particulars on he subject of the mortgage on the hotel and the funds in hand.

Roads.—

Read letter from Chief Engineer, Mysore.

Proposed by Mr. H. Waddington.

Seconded by Mr. R. Lamb.

That the Association point out to the Chief Engineer that the ight (8) miles (133—141) remaining unrepaired make it impossible or carts to carry full loads over the whole road and requests that the matter receives his early attention. Carried.

Nellakotta-Sultan's Battery road.

Proposed by Mr. H. Waddington.

Seconded by Mr. H. Atzenwiler.

That the attention of the President, District Board, be called to the almost impassable condition of the Nellakotta-Sultan's Battery road at Miles 21½, 22½. Carried.

U. P. A. S. I.

Mr. Hockin, the delegate of the W. P. A., read a report on the work of the U. P. A. S. I. at the annual meeting.

Proposed by Mr. D. Taylor.

Seconded by Mr. H. Atzenwiler.

That a vote of thanks be accorded to Mr. Hockin for his services at the U. P. A. S. I. Meeting. Carried.

Proposed by Mr. R. Lamb.

Seconded by Mr. S. Robinson.

That Mr. Hockin's report be printed. Carried.

Read letter from Secretary, U. P. A. S. I., enclosing copy of letters from Traffic Managers of Railways in S. India.

Resolved.—

That the Secretary, W. P. A., be requested to write to the Agents of Estates in the district to ask them whether they consider the correspondence satisfactory.

Plague.—

Read letter from the Collector of Malabar on the subject of the plague.

Proposed by Mr. G. Romilly.

Seconded by Mr. E. deFonblanque.

That the Collector be thanked for his letter, and be informed that this Association will be very glad to assist in the manner suggested; but that its Medical Officer, Dr. Barboza, has left the district owing to illness, and until his return the Association will be unable to carry out his wishes unless a Government Medical Officer can be lent *pro tem.* for the purpose. Carried.

Administration of Wynaad.—

Absence of the Deputy Collector.

Proposed by Mr. H. Waddington.

Seconded by Mr. W. Mackinlay.

That this Association strongly protests against the repeated absence of the Deputy Collector from this District on duty elsewhere, when (as we understand) there are already large arrears of business in the Taluq; and the delay complained of early in the year with respect to business with the RevenueDepartment is increased by all such matters now having to be sent to Cochin; and that there being no First Class Magistrate in the district has already resulted in loss without a chance of redress to Members of this Association. Carried.

Notice of Sales Estates—

Proposed by Mr. H. Waddington.

Seconded by Mr. G. Romilly.

That the attention of the Collector of Malabar be called to the fact that estates and property in Wynaad are being sold for arrears of Revenue, although no notice of such sales has appeared in the District Gazette as supplied to subscribers. Carried.

Non Service of Warrants issued under Act 13 *of* 1859.—

Proposed by Mr. H. Waddington.

Seconded by Mr. G. Romilly.

That particulars of these cases be published in the Proceedings and the attention of the District Superintendent of Police be called thereto. Carried.

A vote of thanks to the Chair closed the Proceedings.

E. deFONBLANQUE,
Hony. Secy., W. P. A.

REPORT OF THE WYNAAD DELEGATE TO THE U. P. A. S. I. MEETING.

Held at Bangalore, August 8th to 12th, 1898.

Mr. Chairman:—

The Proceedings of the U. P. A. S. I. are so fully reported in the papers that there is not very much left for me to report that you are not already aware of. You will have seen Labour and Currency matters are still under consideration. The U. P. A. S. I. has said all it has to say on these subjects, and can only now await the orders of Government. Both Mr. Romilly and myself did our best to draw attention to the inadequate grants for the upkeep of our roads. There are three subjects to which a good deal of attention was devoted of which I see no notice in the *Madras Mail*. These are the improvement of the strain of coffee, the employment of an Agricultural Chemist, and the importation of Lady-birds to combat scale insects. The debates on these subjects will be fully reported in the U. P. A. S. I. proceedings for 1898, and I hope members will procure copies of these proceedings to make themselves thoroughly acquainted with the views expressed, and the information given of experience gained, on these important subjects. I will, however, give you briefly the results of these debates, Coorg has arranged to carry out a series of experiments for the purpose of improving the strain of coffee and applied for permission to draw against the grant of Rs.1,000 from the Reserve Fund voted last year to pay Mr. Cameron's expenses. I supported this proposition as I thought that as only one district had taken the trouble to arrange for a series of experiments under Mr. Cameron's guidance, it was fairly entitled to the use of the grants, more especially as we shall all benefit by the results which will be reported to the U. P. A. S. I. There was, however, some opposition to one district claiming all the grant and eventually a compromise was come to that Coorg should be allowed to draw what was needed up to one half the total amount of the grant. As regards an Agricultural Chemist the Mysore Govt. agreed to pay its share of the cost of his services, if the U. P. A. S. I. and other Govts. concerned would also contribute. It was resolved the U. P. A. S. I. would pay Rs. 2,000 and the other Govts. should be invited to contribute. Since however I understand the Mysore Govt. has generously offered to pay the whole cost of the services of the Chemist recommended, reserving of course his services for Mysore. In striking contrast to this enlightened policy, the Govts. of India, Madras, and Travancore and Cochin have, I believe, refused to contribute at all. All Colonial Governments employ trained experts to develop their industries, and the U. S. Govt. spends some 7,000,000 dollars a year on a regular service of Botanists, Entomologists, Chemists, & other experts, who are constantly employed in experimenting with new products and manures, and in advising how to combat blights. Yet the Government of India, which depends so largely on agriculture for its revenue and the support of its subjects, absolutely refuses to do anything of the sort. With regard to the importation of lady birds there is a balance of some Rs.1,200 in hand of the funds obtained for this purpose; but it was resolved to suspend further action pending the acquisition of the necessary information on the thawing of lady birds, and other ways of exporting them than on ice. An attempt is to be made to get them to Ceylon in Wardian cases, which, if it succeeds, will make the matter very simple. I put down the cultivated area of members of this Association at 12,000 acres (which is I think about right) for purposes of

assessment, but it would be well next year to have an estimate carefully formed before the delegate goes up to the U. P. A. S. I. meeting. I also agreed to endeavour to get members to furnish estimates of tea crops and monthly returns of shipments of tea. These are returned by the Indian Tea Association and the Ceylon Planters' Association, but none are sent in from Southern India, and the London brokers have asked the Indian Tea Association to furnish them. I hope members interested in Tea will furnish the necessary estimates, and we might arrange with the agents to send monthly returns of shipments to the Secretary, U.P.A.S.I. I think we may congratulate ourselves on another very useful and successful meeting of the U.P.A.S.I. and also on the attention paid to subjects connected with the improvement and development of our industries, as opposed to what may be called the politics of the U. P. A. S. I.

J. WILLIAM HOCKIN,
Wynaad Delegate to the U. P. A. S. I.

Non Service of Warrants issued under Act XIII. of 1859.

The following cases were brought to the notice of the Association.

Coimbatore District:—

A warrant for arrest of Karuppa, Tamil Maistry of Kodumudi, Coimbatore, was returned endorsed "not to be found"; a money order sent at same time was delivered without delay by Post Office.

Bangalore District:—

A similar case to above, Warrant for arrest of Maiga, son of Maiga Canann of Old Troop Line, Closepet, Bangalore, was returned "Accused not to be found," although a money order sent by his coolies was delivered without delay and receipt received.

1. *Malabar District*:—

Warrant for arrest of Kunji Karder, son of Abdoola Moplah, Ponani Taluq, Keermuri Amshom, Meyalmuri Desam, Puthanpeediyakkal, remains unexecuted; the police report they are unable to find accused, who however writes complainant he has been informed by Adigari a warrant has been received for his arrest.

2. Warrants have been repeatedly sent since July 1897 for arrest of Bastian D'Cruz of Calicut, a well-known figure at Malabar Club and member of local Volunteer Force. In reply to a complaint made on 8th Jany., 1898, the report on the case by Inspector R. M. Lafrenais endorsed by the Supt., "No neglect on the part of the police" was received. The report is, however, misleading and not in accordance with facts of the case. Accused is frequently seen in Calicut.

3. Warrant issued for arrest of Madambi Kanakan on Kuppamudi Estate was received at Sultan's Battery on 4th Aug. brought to Estate on 15th with explanation that the Estate Writer and Mr. Waddington's butler had advised it should not be served during his absence. Accused obtaining notice absconded on 7th. Warrant endorsed asking explanation as to why representation of a Writer &/or butler had been allowed to stand in the way of execution and why warrant was not served on 5th or 6th August. It was then found warrant was endorsed by P. C. No. 244 that he made enquiries on the Estate on 5th and in proof produces his beat book signed by Mr. Rozario, the Kuppamudi Writer, on that date. This signature was obtained at the village of Sultan's Battery 3 miles from the Estate on Sunday, 7th Aug. Enquiries made show it to be a common practice of the Police to obtain signatures of Estate Writers when they are at the bazaar on Sundays. It was impossible for any enquiries to have been made of Mr. Rozario without the knowledge of Mr. Waddington as he with accused was under immediate observation the entire day of 5th August.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (*September* 16, 1898) says:—Public Sales have been on a slightly larger scale this week, but the tone was quiet for every description, except the colory grades which were disposed of in seller's favour.

About 1,700 bags East India were offered consisting partly of second hand lots which met little demand but the rest sold steadily at about previous rates.

The fine bold colory qualities of Central American realised very full prices, but the medium and common sorts were rather slow of sale and values were barely maintained.

Futures have been a droopiug market, the large Brazilian receipts forcing prices gradually lower, and quotations mark a decline of 9d to 1/- since our last.

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Market Week ending September 14*th*, 1898, states:—Bank rate 2½%. Exchange closes at 1s 3 3/32d. Brazil Exchange 7 1/16d. Rupee pap 62½. Silver 28d per oz.

Supplies have been on a much larger scale during the past w bulk consisting of pale, undesirable qualities, which met a slow at easier prices, the small proportion of hard greenish and fin kinds selling steadily to a further advance.

Brazil markets unchanged.

At the Dutch sale held yesterday in Amsterdam, the moderate of 21,059 bags 17 cases were offered and sold at very irregular pri mostly above valuations, good ordinary Java selling at 35½ cents 37½ cents in August.

Daily receipts averaged 12,700 bags in Rio, and 22,500 bags in S

Futures have continued quiet and lower, with a small busines closing prices shewing a decline of 3d to 9d per cwt., viz.:—Good Santos in Havre, December delivery, fcs. 38.00, in Hamburg pf. No. 7 low ordinary Rio in New York $5.65.

London advices of 16th September, 1898, state :—

Auctions have been on a larger scale this week than for some time past, and the demand has been varied. Plantation Ceylon, which continues in limited supply, sold at steady prices. There has been more East India offered than for some time past, the greater proportion of which was Neilgherry; all desirable qualities sold with competition at full rates, fine marks realising a further advance, whilst the dull and inferior descriptions were somewhat difficult of sale Mocha neglected. Colory Costa Rica and other Central American kinds were very firm, but ordinary qualities were only partly disposed of; Colombian was in active demand for export, and high prices were obtained for bold and colory. The market for "futures" has been flat and prices are easier, closing as follows :—

London	...Santos	...December delivery	...	30s. 9d.
New York	...No. 7 Rio	... „	„ ...	5.60 cents.
Hamburg	...Santos	... „	„ ...	31½ pf.
Havre	...Santos	... „	„ ...	37½ francs.
Holland	...Good ordinary Java	...	...	35½ cents.

At the Dutch Trading Co's public sale on Tuesday, at Amsterdam, 21,059 bags 17 cases offered and sold at very irregular rates—good ordinary Java realising 35½c, as compared with 37½c paid in August, whilst other kinds were dearer.

Public auctions this week have gone off as follows :—

Ceylon.—*Plantation.*—8 casks 3 tierces 38 barrels 14 bags sold, triage 38s to 39s, smalls 50s to 96s, brownish medium 75s 6d to 82s, middling 103s to 107s, good middling 109s to 109s 6d, bold 110s to 112s, pea-berry 90s 6d to 96s.

Ceylon.—*Liberian.*—Of 248 bags a small part sold at 24s to 26s for small and common.

East India.—1,383 bags partly sold as follows :—*Coorg*, smalls 46s, low middling 70s to 70s 6d, good middling 89s, pea-berry 84s. *Neilgherry*, triage 35s, smalls 44s to 53s 6d, low middling faded 58s 6d to 63s 6d, middling to good middling faded and dull 70s to 80s, bold 84s to 97s, pea-berry 70s to 100s 6d. *Wynaad*, bold 88s 6d. *Shevaroy*, triage 35s, smalls 47s.

Mocha.—124 packages all bought in.

Jamaica.—143 barrels 20 bags partly sold—ordinary pale 32s 6d to 33s, good ordinary 38s to 39s. *Blue Mountain*, triage 60s to 78s, pea-berry 123s.

Costa Rica.—Of 6,400 bags offered about 4,200 bags sold—triage 28s to 29s, smalls 34s to 36s, ordinary dull pale 40s to 41s 6d, good ordinary 43s to 47s, fine ordinary greenish 49s 6d to 51s, fine fine ordinary 55s to 58s, low middling 61s to 65s 6d, middling 69s to 72s 6d, good hard 85s to 86s 6d, good colory 100s, pea-berry 49s 6d to 89s 6d; London-cleaned, smalls 25s 6d to 33s, ordinary brownish 40s to 45s, fine ordinary 52s 6d to 53s 6d, fine fine ordinary to low middling slightly mixed black 58s to 66s 6d, middling 70s 6d to 73s, good middling 75s 6d to 80s, good 88s to 89s, pea-berry 74s 6d.

Guatemala.—Of 1,567 bags catalogued about 1,000 bags sold, triage mixed with stones 24s to 26s 6d, smalls 30s to 36s 6d, ordinary pale 39s 6d, fine ordinary 42s, low middling palish 58s, pea-berry 73s; London-cleaned, low middling soft greenish 60s, good middling boldish 77s to 77s 6d, bold 89s, pea-berry 90s.

Salvador.—Of 748 bags offered only 50 bags sold—fine ordinary dull pale 46s to 46s 6d.

Mexican.—Of 353 bags offered only 20 bags sold—London-cleaned, smalls 34s.

Colombian.—Of 2,631 bags offered about 2,000 bags sold, smalls 32s 6d to 37s, fine ordinary pale 48s 6d to 53s 6d, fine fine ordinary 59s 6d, low middling to middling 61s to 67s, good middling 70s to 75s, pea-berry 57s to 65s; London cleaned, smalls 30s to 44s, damaged and soft greenish mixed red 52s to 60s, low middling soft greenish 62s to 63s 6d, middling colory greenish 66s 6d to 70s, good middling 73s 6d to 78s 6d, bold 81s 6d to 91s 6d, peaberry 62s 6d to 68s 6d.

Peruvian.—111 bags bought in.

Brazil.—Of 1,503 bags washed Santos 700 bags sold privately; remainder bought in at 39s to 47s.

To-day's auctions offered 136 bags Surinam, 104 bags Coban, 800 bags Vera Paz, 418 bags Costa Rica, 75 bags Nicaragua, 36 bags Mexican, 60 bags Guatemala, 33 bags Salvador and 1,035 bags Columbian. The sales went off with slow demand at unchanged prices.

TEA.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated September 9th, 1898, says :—

QUANTITY BROUGHT TO AUCTION IN LONDON FROM 1st JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899...	256,166 packages.	367,582 packages.	13,237 packages.
1897-1898...	241,043 „	401,233 „	14,036 „

39,482 *pkgs.* Indian
26,522 „ Ceylon
1,909 „ Java
} Total 67,913 packages were offered in public auction this week.

The month's deliveries indicate a more hopeful outlook; figures for the past three months are also more encouraging; the stock of Indian Tea is now only 2½ millions above what it was this time last year, that of Ceylon being 4½ millions less, while the total stock shows considerable diminution.

Indian. The present week's sale passed off with considerable spirit, bidding being brisk, with a slight rise in many grades, most noticeable in good useful liquoring descriptions, especially among Broken Pekoes. Teas for price were also occasionally a trifle dearer. Averages :—"Darjeeling Co. Phoob," 2/4¾; "Turzum," 1/11½; "Tukvar T Co., Tukvar," 1/10¾; "Seeyok," 1/10; "Runglee Rungliot," 1/7½; "Margarets Hope," 1/6¼; "Cedars," 1/6; "Lebong T Co.," 1/-.

Ceylon. With a smaller sale, and only 16,260 packages for next week, the tendency was strong, and better quotations were noticeable when improvement in quality was discerned, some of the finer liquoring Teas commanding special attention. Medium Pekoes were a shade dearer. Arrivals are now beginning to show an improvement in character. Average for week 7·73d., against 7½d. same period 1897.

Java. Competition was good and prices firm, Teas going at, if anything, slightly dearer prices.

London advices of 16th ult. state :—

China.—Congous have not improved in demand since our last, and auctions have dragged considerably. New season's Moyune Green teas sold at low figures as quality was poor, but old season's, when of good quality, realised somewhat over valuations.

During the week 5,673 packages have been offered at public sale and partly sold :—

Indian.—Public auctions were about on a similar scale, viz.: 38,800 packages, against 39,300 packages last week, and 49,100 packages a year ago.

There was a steady demand for all Teas with attractive liquor at rates which did not show much alteration, but the less desirable parcels were comparatively neglected and often passed in buyers' favour. Pekoes and Pekoe Souchongs with fair cup were taken rather more freely for home and export purposes, but inferior common was difficult to sell except at a slight reduction in price. Broken Teas and Broken Pekoes with strong infusions are in somewhat short supply, and went firmer, while for fine and finest Darjeelings high figures were given, among the best results being :—Poobong Estate, 119 packages, 2s 2d; Dooteriah Estate, A.T.E. Co., 100 packages 2s 1½d; Selimbong Estate, 80 packages, 1s 10½d; Balasun Estate, D.C.T. Co., 116 packages, 1s 9¼d; Turzum Estate, 125 packages, 1s 7d; Kalej Estate, A.T.E. Co., 94 packages, 1s 6¾d.

For 29,900 packages on Garden Account 9¾d per lb. was obtained *versus* 9¼d per lb. for 34,100 packages and 10¼d per lb. for 32,000 packages in the two preceding seasons.

Ceylon.—The amount brought forward marked a considerable shrinkage, being only 15,700 packages, whereas on the 6th inst. 25,900 packages were offered, and 25,800 packages at this time in the preceding year. This unusually small quantity met with a brisk competition for all descriptions. Common to fair leafy kinds occasionally sold fractionally dearer. Medium evinced irregularity and some of the Pekoes, particularly those suitable for export, advanced ½d to 1d per lb. Broken Orange Pekoes and Broken Pekoes over 10d per lb., when possessing choice flavor, in many instances commanded 1d to 2d per lb. over the quotations recorded for the same marks last month.

The average is a little over 8¼d per lb. On the 8th inst. it was 7⅞d per lb. and 7¾d per lb. on the 16th September, 1897.

JAVA.—Nearly 900 packages of direct import were included in the catalogues. A hardening tone was apparent for the better lines, but others were nearly all disposed of without material change.

DELIVERIES.—The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were :—

From 1st to 13th Sept., 1898.....6,872,212lbs.
„ „ 1897.....7,422,158 „

During the week the following have been printed for sale by public auction :—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	33,974	4,829	38,803
Ceylon	15,227	459	15,686
Java	740	158	898
Total	49,941	5,446	55,387

Also 335 packages from second hands.

TEA IN AUSTRALIA.

MELBOURNE, *September 10th.*—The "Australian," with the fourth shipment of Foo Chow teas, has arrived at Sydney. Her sales will be held here on Tuesday next. The "Argus" is expected from Adelaide on Saturday with 227,000 lb. of Indian Teas. The "Onda's" shipments have not yet been disclosed. The market, as a whole, is firm, prices tending upwards, principally in common and good commons China and medium Ceylon.—*Leader.*

TEA IN AMERICA.

NEW YORK, *Sept.* 7.

The auction sale takes place to-morrow, pending which trade has been slow in invoices and in a jobbing way. The market has ruled steady. The offering to-morrow comprises 14,647 packages, viz. :—

1,017 half-chests Moyune—including an invoice of new crop, to be sold "duty paid"; 581 boxes Pingsuey—new crop, to be sold "duty paid"; 90 half-chests Japan—basket-fired, new crop, seasons 1898-99; 1,058 half-chests and boxes Congou—including 186 packages new crop; 285 packages India, Java and Ceylon Pekoe—comprising all grades; 26 packages India greens; 1,920 half-chests and boxes Amoy—an attractive offering, including a large proportion of boxes; 145 half-chests Foochow; 2,543 half-chests and boxes Formosa—new crop, seasons 1898-99, and including very attractive invoices; 6,982 half-chests and boxes Formosa—including a large quantity of very choice "Summer Crop" teas.—*American Grocer.*

CINCHONA.

London advices of 16th ult. state :—

Supplies at Tuesday's auctions were somewhat larger, which, in addition to the large Java shipments last month (over 1,000,000lbs.), and the heavy offerings to be presented for competition at the next Amsterdam sales, caused a languid demand. Druggists' Barks were decidedly easier in value, but manufacturing kinds realised about valuations. South American of new import sold very cheaply. On the whole the unit remains at ⅞d.

Of 772 bales *South American* offered 330 bales sold—Bolivian cultivated Calisaya quill 3d to 5d, flat ditto 5d to 5¼d, Carthagena 1¼d to 1⅜d, and soft Columbian 1⅛d to 1½d per lb.

367 bales, &c., *Ceylon Cinchona* nearly all found buyers, as follo Officinalis, chips 2½d to 3⅛d; Succirubra, chips 2¼d, chips and sh renewed 1⅜d to 2¾d; Ledgeriana, chips renewed 3¼d; Hybrid, 2¾d per lb.

Of 357 bales *East India Cinchona* offered 190 bales sold :—Offic chips and shavings 2d to 2⅝d, ditto renewed 3⅛d; Red, chips and sh 1⅛d to 2¼d, ditto renewed 2d to 2¼d, root 2⅜d, branch 1d t Ledgeriana, chips 2⅝d, branch 2¼d per lb.

143 bags *Java Cinchona* sold :—Ledgeriana, chips 3¼d to 3⅛d, b 2¼d to 3⅝d, root 4½d per lb.

572 bales *African Cinchona* sold :—Succirubra, quill 2½d to 4d, b quill and chips 3½d to 3¾d per lb.

SULPHATE OF QUININE.

Sulphate of Quinine is very slow of sale, but holders do not press recent quotation of 9½d per oz.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, ght Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including ostage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. r line for the first, 3 as. for the second, and 2 as. for the third and succeeding sertions. Five-line (or shorter) advertisements from Subscribers will be serted for three issues for one rupee; non-Subscribers will be charged two upees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic ccurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duff & Co., Proprietors, Planting Opinion," 16/17, Armenian Street, Madras.

IMPORTANT NOTICE.

The Offices of this paper having now been removed o Madras, all remittances should be made payable to . C. Duff & Co., Proprietors, *Planting Opinion*, 16 and 17, rmenian Street, Madras, who will also attend to all dvertisements, &c.

Letters to the Editor should also be addressed to the adras Office.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 21st October, 1898.

Season Reports should be sent to the Printers, Messrs. Addison & Co., direct, and not to *Planting Opinion* Office.

News from Ceylon. A correspondent at Madulkelle writes us, under date 7th instant:—"The N.-E. monsoon has broken here and stopped, and these last three days we've been having typical sweet weather. Labour is plentiful this side, but the flush is not yet."

Coorg. Polli Betta, 11*th Oct.*—*Weather.*—Last Saturday was the only day on which there was no rain. It has rained usually in the evenings and at night. There has been a change to-day. It has been overcast and raining all day since the morning. Heavily at first and a drip afterwards. *Plant-diseases.*—"Leaf" beginning to show up in heavy bearing coffee. It was hitherto restricted to patches in plastic soil. *Crops.*—Picking expected to begin early next month. *Health.*—Good. *Labour.*—Plentiful. *Interesting Items.*—Rifle Meeting from 17th to 20th and Volunteer dinner at Club on 20th.

IN COMPETITION WITH CHINA.

A Suggestion.

Among our notes last week was one from the *Economist* commenting on the report of Mr. Consul Fraser (now Acting Consul at Foochow) on the trade of Wuhu. In that report Mr. Fraser stated that the real currency of China is not silver but copper cash, and further that instead of a *depreciated*, China thus has a highly *appreciated* currency. This is a point that should attract the attention of those who are watching with interest the progress of the inquiry now being made into India's currency and currency requirements. The Bengal Chamber of Commerce has taken the matter in hand, and the lines on which it inquires to run are shown in an extract given on another

page. The Secretary of the U.P.A.S.I. has, we understand, set inquiries in motion, and no doubt further and fuller information will be forthcoming in due course. Meanwhile, however, we venture to throw out a suggestion that the U.P.A.S.I. should not allow Lord CHARLES BERESFORD's mercantile mission to China to pass unheeded. It appears to us to offer an unique opportunity of which planters should promptly avail themselves. The precise instructions Lord CHARLES has received have, of course, not been made public, but during a speech recently delivered at Singapore he said enough to show that he is visiting China literally "on business." He remarked that British trade was getting very circumscribed in all parts of the world; that was to say, other nations were finding out what a very beneficial thing trade is, and other nations were embarking in trade all over the world, not necessarily to our detriment, but in some cases to the exclusion of our trade. It was our business to see that our interests and our trade were not hurt in any way whatever. The present position of affairs in China, with regard to British trade and British interests, was a very critical one. Lord CHARLES went so far as to say that he believed that unless something was done of a definite character, some resolute policy of a peaceful nature undertaken, it might mean the end, more or less, of the British Empire in the future; and he would give them his reasons. And though he deprecated any desire to pose as a man who knew the business of China merchants better than they did themselves, he yet thought that, perhaps, he might be of some use in this very important mission which he had been asked to undertake by the Associated Chambers of Commerce at home, if he could focus the opinions of British traders as to what was necessary, because something had to be done, and the thing was to find out what that something was.

There is no doubt that he might render great assistance to India as well as to England. An inquiry into the Currency of China and the effects there of the fall of Silver has already been suggested by the Bengal Chamber of Commerce and the Bombay and Madras Chambers have supported the proposal. But there is a doubt current as to whether the man specially named for the task is the best available. We therefore venture to suggest that the U.P.A.S.I. should move the Madras Government in the matter, so that Lord CHARLES may be requested to include within the scope of his inquiries matters relating to the China Tea trade, with special regard to the competition between China and India. He could, we are sure, acquire much useful information; and to judge from his remarks at Singapore he would not shrink from the extra work this inquiry would impose upon him. Special facilities for investigation will be given him. He might be asked to give in condensed form a statement regarding the real currency of China, not from the pen of one Consul, but as a result of communication with many. He could easily put before the world a comprehensive report that would clear up many points about which doubts now lurk. We read about the immense tracts of eminently fertile country in China that would be opened up if once European civilisation were permitted to make its mark on the agriculture of the interior. As an example, Mr. ARCHIBALD LITTLE, who has lived forty years in China, describes—in the *Contemporary Review*—the region that is supposed to be the sphere of British interest. The river is about three thousand miles long, and two thousand of these are na Another thousand miles of its principal affluents navigable, so that we have a waterway of three t miles in length flowing through the most populous on the earth's surface. Great Britain and her col about two-thirds of the ten millions sterling imp exports in this region, but Mr. LITTLE says that portion is steadily waning owing to the compet Germany and the United States:—"It is no exagg to say that, given a stable and progressive Gov affording encouragement to capitalists with secu their investments—resulting in improved means munication and a corresponding development of its resources—the Yang-tse valley will increase its leaps and bounds, and the £33,000,000 of to-day £300,000,000 to-morrow." Now this suggests that ments such as are here foreshadowed would include changes and developments in the China Tea i entailing greatly increased competition with India. Indian planters should be on the alert.

We do not purpose to elaborate our suggestion. it is scarcely necessary that more than two or three "heads of inquiry" should be mentioned to Lord BERESFORD. His ideas on the development of the Empire have been plainly expressed. They are, t British Government, with all the energies at its co should try to develop the great waterways of China, they would then have the people with them; the understand that line of transport. By and by things improved, they could invest their capital in but no business man would ever think he was goin a handsome dividend in the near future. Progress lines as these would tend to lower the cost of Ch Planters in India should, therefore, seek to ascer strength of the competition to which they mu forward. They must study not alone the condition which they themselves produce tea and place it markets of the world, but the conditions that no tea-growers in China. Knowing exactly what th to face, they will soon discover what measures to the most effectual protection of their interest. we think, Lord CHARLES BERESFORD could, and would, help them to ascertain the facts that they know, it would be wise to bring the matter to his a time when he has quite exceptional facilities for inquiries.

TEA EXTENSIONS IN ASSAM.

HE Chief Commissioner of Assam has expressed the ion that the adoption of the settled area as the of the extension of ordinary cultivation and of the t of the recent settlement on such extension is calcu- l to give rise to a false impression. He considers that extension of cultivation that has been reported is cipally under tea, and that there can be no doubt that area of crops other than tea has shown a tendency to nish during the past five years. The following tabular ement is given :—

Years.	Area under tea crop.	Area under crops other than tea.	Total.
	Acres.	Acres.	Acres.
893-94	145,134	1,574,175	1,719,309
894-95	153,874	1,533,438	1,687,312
895-96	154,389	1,537,845	1,692,234
896-97	164,639	1,540,157	1,704,796
897-98	178,720	1,506,358	1,685,078

, this shows an actual *decrease* in area under crop n 1897-98 is compared with either 1896-97 or 1893-94; taking tea alone we find the following yearly additions ne area under cultivation :—

Between.	Acres.
1893-94 and 1894-95.	8,740
1894-95 „ 1895-96.	515
1895-96 „ 1896-97.	9,250
1896-97 „ 1897-98.	14,081

ewhere we read that 120 applications were received for settlement of land for special cultivation on favourable ns under Section I. of the Rules. This number, though ller than that of 1896-97, was very largely in excess of number received in any previous year. How far, if at this affects tea extensions we cannot at the moment say.

JAVA COFFEE.

HE position of Java Coffee is always singular, as well ause so much is grown by Government as because of the uliar arrangements made for its sale. Generally speak- other coffees come into competition in the great kets of the world, London chief among these. But a Coffee is almost entirely shipped to Amsterdam for there at periodical auction sales. The interest that se always attract in London is almost as singular as the that they still continue to be held. Although an extra- inary, Java is a potent factor among producing centres, the Amsterdam sales at times exercise a strong influence n prices in London and elsewhere. How much the nd's crops owe to the State can scarcely be estimated, reports such as the following read curiously, and seem lenote that the Dutch-Indian Government is a competent ter :—"The estimates formed for last year's coffee crop e fully realised, as although private production fell some- t short, this was more than counterbalanced by the ps from the Government plantations. From these ls 28,880 tons were picked, and from private estates 26,400 tons, against 16,565 tons and 25,500 tons, respectively, in 1896." Early in the year prices ruled high, but later there was a heavy drop in values in Europe, and this greatly affected the lower qualities of Java Coffee and all classes of Liberian. The cultivation of the latter was being largely extended in Java, and a fall of about 40 per cent. in prices was a serious matter. This year, a period of drought during the usual flowering season was followed by excessive rains. The crop is likely, therefore, to have proved an almost complete failure. Estimates were reduced by about 30,000 tons, the figures being as follows :—

	Quantity.	
	Piculs.	Tons.
Java Government crop	134,064	8,125
Sumatra „	37,000	2,242
Private Lands, Java Coffee	192,355	11,658
„ „ Liberian „	49,554	3,003
	412,973	25,028

This time, it will be seen, private crops are estimated to exceed those of Government plantations.

As regards prices obtained in 1897, we may remark that at the Java Government Coffee Sales the lowest average was fl. 24·45 and the highest fl. 62·86 per picul = say 33/6*d.* and 86/3*d.*, respectively, per cwt., while the extremes at the Padang Government Coffee Sales were fl. 51·53 and fl. 80·60 = 70/3*d.* and 110/6*d.*, respectively, per cwt.

The exports of Coffee from Java during 1894—97 were as follows :—

	Private.	Government.	Total.
	Tons.	Tons.	Tons.
1894	39,376	34,274	73,650
1895	32,354	16,890	49,244
1896	36,039	9,887	45,926
1897	26,400	28,880	55,280

It may be remarked that during 1897 dried blood was imported into Java largely as a fertilizer. Its use is stated to have been found advantageous on many coffee estates.

THE LOWER PULNEYS.

(From a Correspondent.)

"P. O." readers must think the Lower Pulneys have quite gone under, by bug or other causes, from the little news of the district that appears to reach the Editorial ear. But they *do* exist still, if in a merely modified state of existence as compared with other and more flourishing districts. There is no doubt that the bug is answerable to a very great extent, though indirectly, for the apathy of the District Association, whose doings lately have not been worthy of record. Unfortunately possessing fewer members than ever it has done since its start, the Association has not the potential energy of capital behind it to spur it on to deeds of derring do in the Planting World, and, be it said with due shame, very few members take more than a casual interest in an Association which is not spurred on to *something* or other!

We have had a glorious season with one exception. Starting with simply gorgeous blossoming showers that brought bumper estimates all over the hills, and bumper smiles all over the proprietors' faces, the Clerk of the Weather, maliciously or unfortunately, got the rain tap jammed for the best part of four months, thus ruining our hopes and lightening our bean and berry, preliminary to lightening our pockets likewise, and now, as if to add insult to injury, we are assailed with the best planting and crop-ripening (if we had any crop to ripen) season we have known for many years. In common fairness, however, I must say that crops for general badness are not a patch on last season, and proprietors may recoup what they lost last year, but—we *did* so hope for a bumper!

The extent of the drought we have suffered may be somewhat appreciated when I say that the greatest difficulty has been experienced in almost every estate in getting sufficient drinking-water for bungalow use. Holes in the beds of the all-too-dry streams were shared by chukkler, manyadi, chetty and *dorai* alike, and the stench of the thick black mud in the, possibly, only waterhole for miles round was a thing to be felt, but hardly otherwise believed.

Planting has been vigorously carried on for the last month or so on two or three estates, and the weather has been all that heart could wish. Basket-planting has been the order of the day, and though not new to the Pulneys, baskets have yet to become general favourites. However, this year's planting so far cannot be beaten, I venture to say, by any district. Plants put out in August are absolutely bubbling over with life and spirits, and so far from any dying, I verily believe one would have to root them up, expose them on the bare rock for a week, and finally beat them with a club before they would give up the ghost. It may be that I am an optimist.

The results of the excellent *trenching* done earlier in the year are apparent in many estates, patches that have been left untrenched showing up in the most marked way by contrast with the rest. Coffee generally, however, even in spite of bug, is looking excellent.

Picking has begun in good earnest, though the Northern estates are not so forward as the more Southerly. Labour is never too plentiful at this time of the year, but I believe it meets all existing wants, but if we had on the trees the crop we expected to have, we should all be crying out about the scarcity thereof.

September brought us over nine inches of rain—considerably above the average, though, owing to the drought in the middle of the year, the total rainfall from the 1st January to 30th September is only 27 inches, when it should be nearer 35. These late good rains have brought the general prices of grain to the normal, but not the normal of ten years ago, alas!

The Pulneys are becoming quite a good place for sport. Whether the cause is the extinction, or approaching extinction, of the cheetah on these lower slopes, or some less understood one, I cannot say, but certain it is that the pretty, and I may say tasty, spotted deer is becoming more and more common every month; and I have seen more pig during the last three weeks than I have seen in the previous four years.

There is much planted land in the market now, both within Zemindari and Government boundaries.

Native coffee is bearing wonderfully well all o hills, and seems, on the whole, less attacked by bu well-cultivated coffee. I have noticed in very estates, where the weeds have been allowed to gr bug is not damaging the coffee to the extent no elsewhere. I do not attempt to give an explana this, but it is certainly not because the bug goes weeds, the characteristic of these places being the complete absence of the bug from end to end.

Towards the middle and end of the recent drough the cooly on hills and plains was shouting for wor of the native proprietors took the opportunity of their weeding done on the cheap, but with the fir this stopped short suddenly, and weeds now run ric all over the hills on the native estate.

NOTES.

Reductions! In the Northern Tea d reports are current to the effe the shears are to be applied to the salaries of the Eu establishments on several concerns in the tea distric

Calcutta Tea Sales. The average of the Calcu sales of 28th ultimo was five eight pies. About 24,000 packages were offered sales on 6th instant. There was a steady market all except poor liquoring kinds, which were so neglected. Sales amounted to 23,062 packages.

Tea Samples per post. It is announced in the C papers that the weight of packets containing tea addressed to places in the Kingdom or forwarded in transit through the Briti Office to the United States of America, Canada and British Colonies is limited to 8 oz. The limit of we samples of tea when addressed to France is ¾ oz.

Java Tea. Exports of late years have as follows :—

1894	...	...	8,734,425 lb.
1895	...	...	10,146,800 „
1896	...	...	9,568,732 „
1897	...	...	11,218,559 „

The figures point to fairly steady expansion.

Coffee Blight in Burma. News from Toungoo says bight is working great destr amongst the coffee plantations there, all the gardens of Leikhto being badly damaged, while those n Toungoo are now showing signs of being affected. S is wanted as a preventive, but the provisions of the

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., cont ton :—

61·50	lbs.	Nitrogen.
57·38	„	Potash.
14·92	„	Lime.
13·68	„	Phosphoric Acid.

Seed cured under essrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of see the parent trees of above analysis at Rs.6 per pound con about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhe from the

MANAGER, ARIENKOW ESTATE,

Shenco

Act put serious difficulties in the way of planters securing a supply from Rangoon.

Careful Plucking of Tea. A Dimbula planter remarks that he does not pluck fine but simply more carefully, and discards the coarser leaf. He says this has an almost imperceptible influence on the total output per acre—much less than people imagine. What it does is to increase the cost of plucking per lb. of tea, as one has to go round more often, and the amount each cooly brings in is less. This, of course, makes plucking dearer, but the result is a gain of as much as 2*d.* per lb. added on to the average.

Java Cinchona. In Java, as in India, the State enters into competition with private growers of Cinchona bark. The following are the statistics of exports of late years :—

	Private. lb.	Government. lb.	Total. lb.
1894 ...	8,994,217	712,478	9,706,695
1895 ...	7,620,770	810,370	8,431,140
1896 ...	9,440,855	631,177	10,072,032
1897 ...	7,901,502	597,224	8,498,726

It is good to see "private" figures so well in advance.

Chicory Prospects. *L'Economie*, of Tournai, Belgium, September 11, 1898, reports :—During last week the heat returned with increased intensity. The dry weather prevents the root from growing; we must, therefore, expect a very poor crop, both in quality and yield, and, owing to want of rain, any late sowings may be considered as totally lost. We estimate that the deficiency as compared with previous year will be fully 50 to 60 per cent. of the total production. On the other hand, available old root in all countries is not more than 12,000 tons, against 50,000 tons last year. Under the circumstances, prices have again gone up during the week to the extent of 1f. 50c. per 100 kilos.

Consumption of Ceylon Tea in United Kingdom. A Colombo merchant having written :—"I don't know if you noticed in Gow's Tea Circular that the home consumption June to August this year shows a falling-off in Ceylon tea of about 2 million lb.

The figures are :—

1897	...	...	22,909,594 lb.
1898	...	...	20,952,233 „

It seems strange,"—the *Ceylon Observer* asks somewhat uneasily :—"Can this be due to the shorter supply of Ceylon tea as compared with Indian tea, the consumption of the latter being about 2 million lb. comparatively higher ?"

The London Market. Messrs. Gow, Wilson and Stanton cabled to Ceylon on 6th instant that the quality of offerings generally was improving, good liquoring Broken Pekoes were wanted, the market for poor liquoring teas was steady, the price of fair liquoring Ceylon Pekoe Souchong was 6½*d.*, and the average price of Ceylon Tea sold on Garden account during the week was 8½*d.* This shows an advance of ¼*d.* Reuter reported :—Tone of Ceylon Tea—Good demand at fully previous prices. Fair Pekoe Souchong he quoted at 5½*d.* (same as last week) and the average 8½*d.* (¼*d.* up). 18,000 packages of tea were offered for sale, of which 17,000 sold. Of Indian Tea 47,000 packages were sold out of 52,000 offered. The average was 8½*d.* (a decline of ¼*d.*)

Coffee in Mexico. Mr. Consul Carden reports on Coffee-planting in Mexico :—"Owing to the heavy fall in the price of coffee, which appears to have been due mainly to over-production in the world generally, and bids fair, therefore, to be to some extent lasting, the increase in the value of the exports is much smaller than the increase in the amount exported would lead one to expect. Although the reduction in the profits of coffee planting will probably have the effect of diverting the attention of investors to the cultivation of other products, the cheapness of labour, due to the fact that wages are paid in silver, will always give Mexico a great advantage over other countries, and it is scarcely possible to imagine a price for coffee so low that it would not leave a fair profit to the Mexican planter.

The Grand Pyramid! The Coolgardie Exhibition of 1899 and Paris Exhbitition of 1900 were entered on the Agenda paper of the Pussellawa Planters' Association at its proceedings on 28th ultimo. The Chairman, Mr. Duff Tytler, explained that this was done simply with the view of impressing on members the great importance of each one doing all he individually could towards the pushing and advertising of Ceylon teas *whenever* and *wherever* they could. There was no more valuable way of doing so than making a good show at all such centres of attraction, especially in countries outside Great Britain, whether English colonies or foreign countries. If every planter sent, say, 15lb. (5lb. each, say, of three grades), the cost *individually* would be very *small*, but *collectively* what a grand pyramid, and advertisement, especially if the tea was given away for free distribution ! Like the advertisement for "Players Navy Cut" they would have every man who attended these exhibitions and drank Ceylon teas *insisting* over the counters that they got *Ceylon tea* and *no other*.

Ceylon Tea Shipments in September. The total shipments of tea from Ceylon to the United Kingdom for last month amounted to about 7,500,000lb., as compared with 6,167,836lb. for September last year. The figures from 1st January to 30th September are as follows :—

	lb.
Shipments to U. K. to 30th September, 1898 ...	75,290,000
Do. 1897 ...	77,483,000

The figures for shipments to other markets are :—

	lb.
Shipments to Australia to 30th Sept., 1898 ...	10,960,388
Do. 1897 ...	9,205,561
Increase	1,754,827
Shipments to America to 30th Sept., 1898 ...	1,816,009
Do. 1897 ...	569,708
Increase	1,246,301
Shipments to Russia to Sept. 30th, 1898 ...	1,634,865
Do. 1897 ...	324,642
Increase	1,310,253

Obviously Ceylon is not unsuccessful in pushing its teas into these markets.

A Tea Cryptogamist. It is astonishing how civilization increases man's wants and causes the luxuries of the past to become the necessities of the present. Ceylon has had the services of a special fungus-studier for some time and now wants him appointed permanent Cacao Cryptogamist (what's in a name!). The *Observer* goes one better and says:—"But there are others who should be quite as much interested in the retention of the Cryptogamist. We do not wish to raise any alarm; but no one can read the several works published in India on tea pests, without realizing that our staple has its fungus enemies quite as much as Cacao." Our contemporary adds:—In Dr. George Watt's large volume on the 'Pests and Blights of the Tea Plant' there is very plain speaking as to the serious effect which the 'grey blight' and the 'blister blight'—both fungi—may have on tea in Assam, if the beginnings of their attacks are not watched and promptly dealt with. For this reason alone, is it not indispensable to have a Cryptogamist on the spot to be ready to deal with any fungus pest on Ceylon tea. Even now such is not unknown at certain seasons of the year, and it would be wilful blindness not to take the needful precautions when the right man for the work is already in the island." So it would, and it is to be hoped that the Madras Botanist, when he arrives, will prove to have a knowledge of fungi as well as of industrial problems connected with his science.

Coffee Hybrids. The *Ceylon Observer* refers to "a rather curious discussion" on this subject in committee of the U.P.A.S.I., and observes that as regards leaf disease it is a pity that all concerned do not take Mr. Marshall Ward's report as final, in regard to the life-history and action of *Hemeleia vastatrix*, and save themselves the trouble of describing appearances and attacks. As our contemporary admits that "certainly there must be a wonderful difference between Mysore coffee and the best left in Ceylon in view of what Mr. Graham Anderson states," we do not see why differences in regard to leaf disease also may not become apparent from time to time. The *Ceylon Observer* would like to know whether Mr. Anderson's crops per acre over his estates for 1893-8 as compared with those of 1883-8 justify his cheerfulness and adds:—"The coffee crops in Mysore as a whole have, we suppose it will be admitted, fallen off greatly in the period named." Perhaps Mr. Anderson will kindly enlighten our contemporary on the point raised. Its concluding remarks are as follows:—"In our leaf disease era, fresh seed from Mocha, East and West Africa, Jamaica, &c., were tried again and again without advantage; but no experiment in hybridisation was made *or at any rate persevered in.* It will be interesting to watch coffee developments in Mysore, Coorg and Wynaad." The italics are ours. Systematic and persevering work are essential to success.

LETTERS TO THE EDITOR.

SHADE.

Sir,—I see your South Mysore Correspondent is writing about Shade. Has he ever tried *Albizzia Jeyesaman.* I've never tried it as a preconcerted idea, but on an estate (tea) that I know very well there are a lot of *Jeyesamans* dotted about, and under them you'll always find a few healthy coffee trees that have lingered on when the rest died or were cleared out for the And you'll see no other coffee trees in the place.

Can you recommend a good shelter tree for a windy distr this estate holds the record for Ceylon. The late Superintend always slept on one side, and the wind, which is so strong it easily goes through a brick wall, made him permanently on one side.

Madulkelle, 7*th October*, 1898. } M.

TEA COMPANIES.

Associated Tea Estates of Ceylon (Limited).—The report for year ended 30th June last states that the area of the Compan estates was 2,759 acres, and new planting has been done on Sil Kandy, Chesterford, and Doragalla, to the extent of 91 ac making a net planted area of 1,889 acres. Some of the immat tea taken over by the Company has been very unsuccessfu planted, and has had to be supplied several times over. nurseries were put out with a high-class jhat of seed and h proved very successful, leaving on hand a large supply of se lings after satisfying immediate requirements. The yield has talled 707,969 lb. This, although showing an increase of 22,228 over the previous twelve months, is 57,031 lb. less than the agg gate of the Superintendents' estimates. Of the crop, the ent produce of two estates was sold in Colombo, and of two oth partly in Colombo and partly in London. The portion sold Ceylon, 544,680 lb., realised an average of 34·69 cents, and 163,289 lb. in London an average of 9·90*d.*, making together, af allowance for shipping charges to London, a gross average 7·11*d.* per lb. This compares with 7·28*d.* per lb. for the previ year. Considering that the general average of all Ceylon tea s in London public auctions fell from 8·04*d.* to 7·76*d.* in the respect periods, this Company's prices may be considered satisfacto The Chesterford and Madultenne estates were amalgamated as fr October, with satisfactory results as to economical and efficie working. The estimates for the twelve months ending 30th Ju 1899, are for a crop of 783,750 lb., an increase of 75,781 lb. over yield for the previous year, and the directors consider that figures are reasonable and likely to be realised. With the excepti of two estates, which are deficient to a slight extent, the labour fo is good and ample. The revenue account shows a net profit £4,694, to which falls to be added the balance of £165 broug forward from last season, making a total of £4,859. Out of t the directors paid £3,050, being interim dividends at the rates 3 per cent. on the preference and of 2½ per cent. on the ordin share capital, leaving a balance of £1,809, out of which the direct propose to pay the final dividend at the rate of 3 per cent. on t preference share capital (making 6 per cent. for the year), wh will absorb £1,800, and to carry forward the balance. The direct regret that the revenue has proved insufficient to pay a furth dividend on the ordinary share capital, but the yield has not be

reasonably progressive; the level of market prices has been lower; the rate of exchange has been still higher than before; the supply of rice has again been carried on at a loss instead of at a profit; and, in addition to these adverse circumstances, there has been the state of transition and reconstruction at the principal factories which could not fail to affect results both as to expenditure and income.

Scottish Ceylon Tea.—Interim dividend at the rate of 7 per cent. per annum for the half-year ended June 30th last on both ordinary and preference shares.

Dimbula Valley (Ceylon) Tea.—Interim dividend of 3 per cent. for the half-year, less income-tax, on the preference shares.

EXPERIMENTS IN TEA MAKING.

The *Ceylon Observer* directs the serious attention of the Committee of the Planters' Association to the following paper by Mr. John Hughes received by last mail :—

After writing for twenty years and recommending the scientific manufacture of tea in accordance with the Chemical principles involved, it is very gratifying to the writer to learn that the appointment of a distinguished and able Chemist as expert has at last been made. On reading in the last *Overland Observer* the account of the meeting of the Dikoya Planters' Association however, in reference to Mr. Bamber's proposed work, I could not help thinking that the terms of the appointment were either misunderstood, or that the benefit to be derived from Chemical research in the manufacture of tea had not been fully thought out by those who made the appointment.

So far as the analysis of the soil or samples of different soils are concerned the work, which is long and tedious, can be more readily and cheaply performed here than in Ceylon, with the advantage of having a great number of previous analyses for *comparison*; and I am sure that Mr. Bamber, with whom I am personally acquainted, will fully bear me out in this remark.

What cannot be done however at all by home Chemists and what I have endeavoured for so many years to impress upon planters is the work of local, personal and daily research into the chemical principles of tea-making by a persevering, industrious and fully qualified man such as I believe the planters have in Mr. Bamber. It would be a most unfortunate mistake if the time of such a man were to be taken up in the analysis of soils from different estates.

It is not so much the making of soil analysis that is difficult, but rather the difficulty of having sufficient previous knowledge of the composition of really good estates, so that one can make a practical comparison.

I am reminded of a distinguished Dimbula Planter who met me during my official tour through the planting districts in . . . and was very anxious that I should visit his estate in order as he said that I should analyse the soil on the spot and who was greatly disappointed when informed that such an arrangement would be impossible on account of the absence of the requisite apparatus for performing the chemical analysis and the time that such analysis would require.

If the planters would take my suggestion about a matter that I have been thinking out for years, Mr. Bamber should be allowed to make his own selection of a well-appointed factory in reasonable distance of his bungalow at Hatton, and where day by day he would superintend the manufacture of tea according to his own views, carefully analysing the natural leaf and the prepared leaf during the different stages of manufacture, with due regard to the temperature and the humidity of the air in the several processes.

Travelling about the districts afterwards may be useful, but until some practical work in the factory, aided by chemical analysis in the Laboratory close at hand, has been completed, it will only be a waste of valuable time to go from place to place.

All scientific investigations must be carried on in properly arranged works and laboratories and according to a definite pre-arranged plan, and under careful personal supervision; otherwise no usefnl results could possibly be obtained.

I feel sure that Mr. Bamber will cordially support me in these suggestions and probably will have anticipated me in these remarks; if so, they will be useful in supporting his own views; but having taken a great personal interest in the importance of instituting chemical research in the manufacture of tea I felt that the opportunity favoured a definite statement in regard to the most practical way of carrying out the same, and I trust these lines will be accepted in the same spirit as they have been written.

THE AVAILABLENESS OF ATMOSPHERIC NITROGEN FOR AGRICULTURAL PURPOSES.

A Ceylon contemporary publishes the following communicated paper, with the signature "C. D.":—

It is generally known that plants owe their nitrogenous food to the circulating nitrogen among plants, animals, and the soil, and that with this circulation the nitrogen of the atmosphere has very little connection: in other words, that it is the decomposition of organic matter and the nitrification of the organic nitrogen contained in it that furnish the soil with the nitrates which are ultimately available for absorption by the roots in the small proportion of ammonia and nitric acid which are held to be directly absorbed by the leaves.

The comparatively small contributions which are made by atmospheric nitrogen to the stock of nitrogenous food are due to the combination of the nitrogen and oxygen through natural electric discharges, and to the fixation of nitrogen by the bacteroids (root bacteria) found in the root tubercles in certain plants. These phenomena are recognized as the only two original sources of combined nitrogen to the plant, imparting, as they do, compounds directly derived from the elementary nitrogen of the atmosphere into the general circulation of nitrogen through soil, plant and animal. The possibility of making use of these two natural processes, or artificially reproducing their results, so as to render the agriculturist altogether independent of the nitrogenous fertilizers now in demand, is an important speculative problem. Indeed, in the case of the action of root bacteria in storing up atmospheric nitrogen in the tissues of certain plants, the process has been practically applied for fertilizing the soil by using nitrogen-collecting plants either in rotation in the case of annuals, or as a mixed crop in the case of perennials, so as to secure the results of their action on crops that follow or grow contemporaneously with them. The attempt to facilitate this action by means of pure cultures of root-bacteria ("nitragin") has so far not produced sufficiently reliable results warranted to make the use of inoculating media of any practical value.

As regards the other original source of combined nitrogen to the plant, it has remained for Sir William Crookes, in his address before the British Association, to declare his belief in the possibility of artificially producing the combined nitrogen for which we are now indebted to the action of natural electric discharges, whenever they occur, in the atmosphere. This he proposes to do by utilizing water power to generate an electric current for bringing about the oxidation of nitrogen and thereby the production of nitric acid.

Chemists tell us that the process of assimilation in plants, whereby they exhaust the carbonic acid of the atmosphere and replace it with oxygen, is necessary for preserving the air we breathe, in a condition suitable for the requirements of animal life, which would otherwise be rendered intolerable if no such counteraction went on, and if the process of animal respiration continued to exhaust the oxygen and replace it with carbonic acid gas. Chemists also refer to nitrogen as an eminently inert substance, whose rôle as a constituent of the atmosphere is as a dilutent of the oxygen (the two gases existing respectively in the practically constant proportion of 4 to 1) since an atmosphere of pure oxygen gas, or even one in which oxygen predominated would be unsuitable for animal respiration. If we may be permitted to speculate with Sir William Crookes, how, we would ask, is the constant ratio of nitrogen and oxygen to be maintained in the atmosphere, and the composition of the air preserved in the most suitable condition, if agriculture all the world over is to flourish by the exhaustion of atmospheric nitrogen? Where would be the counteraction by which the supply of the dilutent is to be kept up, and the composition of the air remain unchanged, if it is to be drawn into the general circulation of combined nitrogen and never drawn out again in the elementary condition?

So far, as we have stated, the nitrogen of the air has been looked upon as a neutral element, and it appears strange to the student of nature to think of such a character, for so valuable a substance, taking part as it does in the constitution of the highest organic compounds. But who can say what discoveries have yet to be made through scientific research in the future, after we have seen "argon" eluding the search light of Chemistry all these many years since the first chemist entered his laboratory? Who knows but that there will yet be an explanation of the apparently anomalous character with which scientific men invest nitrogen, and that we shall learn what would seem to be less inconsistent with the designing power of Nature, that atmospheric nitrogen also plays its part in the general economy of the world, or at least as Sir William Crookes predicts, that it is destined to do so, while still subserving its purpose in maintaining a suitable atmosphere for the benefit of mankind and the inferior animals, if its presence is indeed really necessary for this end?

It may be noted, in perusing the communicated article on this subject in last night's issue, that criticism can be anticipated to the effect that the argument as to the exhaustion of atmospheric nitrogen by its appropriation for the nutrition of plants applies equally well to the exhaustion of the free oxygen of the air, since the combination of the two elements through elastic agency, and their ultimate exhaustion as free gases, would be in a constant ratio. The necessity for speculation as to the return of elementary nitrogen to the atmosphere would there also stand in the case of elementary oxygen, in order to account for the preservation of a uniform atmosphere for the respiration of animals. This would demand a further hypothesis! And how is it to be supplied?

Sir Wm. Crookes refers to the sea as the receptacle for the almost incalculable amount of organic nitrogen which reaches it under present conditions of civilized life, and points to the immense loss of nitrogen to the plant and soil through the disposal of sewerage by this means—a factor which tends to bring about that crisis in Agriculture which he predicts.

Agricultural Chemistry further tells us that the largest loss of nitrogen from the soil occurs by the washing away of nitrates—among the most soluble of salts—which ultimately reach the sea.

Is it to be supposed, then, that the greater sea which is being enriched at the expense of the lesser land, is holding these reserves of nitrogenous compounds for a future generation,—to be redeposited through geological agency in the form of natural formations of nitrate as in Chili? Or should we rather give further licence to our speculative powers and think of the sea as the medium by which elementary nitrogen and oxygen are returned, through chemical or organic agency, to the atmosphere, just as it is the medium, though, in a different sense, by which the water lost from the earth is given up to the atmosphere to be returned as rain. The denitrification theory, so much discussed of late, teaches us that certain organisms, the denitrifying bacteria, are instrumental to some extent in supplying the atmosphere with free nitrogen derived from the organic matter in the soil, and why may not a similar phenomenon occur as regards the immense amount of nitrogenous compounds which reaches the sea? Such a hypothesis may be supposed to equally balance the profit and loss accounts of soil and air as regards their nitrogen and oxygen, but how dare we adopt it?—C.D.

PRODUCE AND PLANTING.

Just Going to Begin. So much has been written of late about the supreme efforts which are to be put forth in China for the rehabilitation of the tea trade that one wonders when the attempt is to be made. Amoy would not be a bad district for the experiment. But the likin is the obstacle. For some years this Amoy was one of the chief centres of the tea trade of China, the leaf exported from there having a character of its own. But this trade is now disappearing. According to the last report of the British Consul there, Amoy exported in 1877 over 12 million pounds of tea; in 1896 the export was less than 4½ million pounds, and last year it fell to 1,616,933 pounds, and he believes that soon tea will cease to be a product of the district. There is little doubt that the extinction of the industry is due to the ruinous system of taxation. The heavily taxed Amoy black tea cannot compete with the untaxed India Ceylon teas, while the dilatory and vexatious modes of collecti likin lead to much of the leaf becoming damaged during transi the Amoy district tea gardens are to be seen which have run to the comfortable homesteads of the once prosperous tea-growers in ruins. "Unless the system of taxation is reformed the pro of this district are somewhat gloomy. There is as yet no indi of such reform. The only idea the authorities seem to have endeavour to obtain from the decaying industries as large a re as they obtained from them when in a more flourishing cond and the only means to this end they seem able to devise increase the stringency with which the likin is collected, an accelerate the total extinction of the trade." In a special repo the tea trade, which is appended by the Consul, it is stated tha best expert known in Ceylon after visiting the Amoy tea di stated that under no circumstances could they be revived so enable them to stand the taxation at present levied in China.

Pushing China Tea. Chinese tea importers, or those who exclusively in the China product, ar pared to follow the example of their Indian and Ceylon riva the forthcoming Grocers' Exhibition at the Agricultural Ha exhibitor will have an attractive stand in the form of a Chine house; the attendants will be real Chinamen and women dres their native costume.

One-sided Congratulation. The rising rupee, like the rising s hailed in some quarters with acclar as if it were a boon to the whole of To the official classes it is no doubt a great gain, and they can to be jubilant over it. To the producer it is a very serious mat deed, and he cannot shout in unison with those who extol the w of the financial policy of the Indian Government. The *Daily G* in a note congratulatory of the rupee having turned sixteen omitted any reference to the other side of the picture. A corre dent, "Rungli Ting," supplies this omission by a letter in wh points out that there is another and important side to the qu viz., the industries and export trades of India. "The balance- of the various tea companies for last year," says "Rungli T "with their decreased dividends, give a fair indication, and penny rise in the value of the rupee, sustained throughout the necessitates those interested finding a further sum of be £350,000 and £400,000 to work the estates. This is an ab loss, there being no commensurate rise in values, while the ad of a gold standard means over three millions sterling per a and consequently ruination to the tea industry throughou Indian possessions. What was waste land in Assam and C less than fifty years ago has been brought into cultivation at of 35 millions of English capital, and is now giving employm over one million natives recruited from the congested distri Bengal, and some thousands of Englishmen as managers, assis &c. The 450,000 to 500,000 acres of land so cultivated brin Indian Government in a yearly rental of no mean sum. The p inflated value of the rupee is starving us. A gold standard assuredly kill one goose that lays a golden egg. Can the I Government afford to do this? I take the material side o

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

estion and leave sentiment to public opinion. Notwithstanding bounty given to other countries by placing a fictitious value on rupee, we Indian planters have held our own against China, an, and other tea-producing countries in a fair and square fight ending over half a century, meeting each rise in exchange by ering the cost of production by machinery and other means: but this respect we have touched bottom. With Indian exchange sixteen pence, and Chinese and other silver-using countries at ten ce (or less), we can exist; with the adoption of a gold standard, latter rate will still obtain, while we go up to twenty-four ce, or receive Rs.1,000 for £100, as against Rs.2,400. With such nsummation we may honourably surrender, not by reason of ng beaten, but because we have been told to the enemy by our nds (?) the Indian Government. The same applies to ordinary orts from India, also produced in other silver-using countries ere the same goods and of equal value are offered. £100 will mand the purchase in India at the present time of 1,500 silver ces worth of commodities, elsewhere 2,400. Is it likely money find its way to India on such terms? To put the position in a shell, what the Germans have done for our sugar industry in West our own Government threatens to do for our tea ustry in the East."

Market Worth Developing.

With reference to the statement in our last week's issue that the tea procurable at railway refreshment rooms left something be desired in the way of excellence, it is only fair to state that ne refreshment rooms at railway stations supply better tea than ers. Where the tea and coffee is of good quality and properly wed the demand constantly increasing. A Leeds paper has ently instituted inquiry into the matter, and gathers the informa- that trays of tea and coffee, owing to the excellent system of plying them to passengers in railway carriages on the North- tern Railway, are in great demand. The manageress of the rth-Eastern Refreshment Rooms states that about twenty years , when she began her experience, there was not one cup of tea or ee ordered where now there are a hundred. The refreshment ms of this company do a large trade at York, Harrogate, Darling- , and Newcastle by meeting the trains with trays of tea, coffee, light refreshments, while at none of these stations are intoxi- ts sold outside the refreshment rooms.

---

go State Coffee.

The poor quality of the coffee despatched to Antwerp from the Congo Free State last uary has now been followed by a further shipment, which experts are to be a considerable improvement over the previous samples ed at the beginning of the year. The Congo coffee, whilst mbling the Ambriz product cultivated in the Portuguese colonies frica, is said to be far superior to it. It has a pleasant although ewhat unusual, taste, and by admixture will facilitate the bur- process of other and better qualities of berry where the flavour ot affected. The tests made show generally that considerable gress has been made in the method of cultivation and treatment he coffee raised near Stanley Falls.

New Departure.

Boards of Guardians have not so far as we are aware any special qualifications as tasters, but they evidently think they can acquire some. At meeting of the Spalding Board of Guardians on Monday, the dians adopted a new method of determining the tea tenders ived from London and local tradesmen. The examination of samples as hitherto was not considered a sufficient test of the ity, and it was decided that tea should be brewed from each ple, and cups handed round to a committee appointed to adjudi- . The committee of four appointed included one lady guardian. . & C. *Mail.*

THE POSITION OF THE INDIAN TEA INDUSTRY.

Investors in tea companies who are not in a position to glean ise information as to the cause of the decline in the value of shares will read with interest the comments put forth by the *ncial Times* on the present position of the tea industry.

The small profits made during the past year by Indian Tea panies generally compared with previous years have naturally ed some anxiety among those who favour this kind of invest- t, and some doubt has been expressed as to the actual cause for the diminished returns. Over-production has for some little time been held out as a danger, and there is undoubtedly a well-founded probability that unless a stop be put to the continued extension of gardens, production will far outstrip consumption. But that this cause was not entirely responsible for the comparatively poor results of the past year is evident from the statements made at the recent meeting of the Indian Tea Association held at Calcutta, the full report of the proceedings at which is just to hand by Mail. First there was the famine, which, although it benefited the industry by making labour cheap and abundant, yet adversely affected the profits by putting up the price of food. One company in Assam, the Chairman stated, had to write off for loss on rice a sum equal to about $1\frac{3}{4}$ per cent. of its capital, and in other instances severe inroads were made on the returns from this cause alone. The plague also, though it did not invade the tea districts, temporarily dislocated business, but the scare gradually subsided, and matters are once more assuming their normal condition. The currency question, however, is regarded as of most vital importance to the tea industry which has felt severely the effects of the inflated exchange, and it is only natural that the chairman should have devoted considerable time to discussing the situation. He calculated that an increase of every penny in exchange made a difference to the tea industry of £250,000, and, therefore, taking a basis of 1*s.* 2*d.*, the average rate for 1895, the industry has lost in consequence of the inflation of exchange close on one million pounds sterling during the years 1896 to 1898. He also pointed out that if the committee decided to support the Government in its endeavour to maintain a rate of 1*s.* 4*d.* for its Council bills, the industries of India had, in his opinion, hard times before them—a result which would not only enable China to make a strong effort to recover some of her lost ground in the tea market, but would encourage the establishment of other industries in the Celestial Empire.

"The Chairman, indeed, drew a gloomy picture of the future. He would not, he said, be surprised to see before many years are over the reorganisation of Chinese industries, the opening of collieries and the erection of jute and cotton mills by Europeans, which will displace the productions of India if she continue to be handicapped by an artificial exchange. It is to be hoped that these prognostications will not be fulfilled to India's disadvantage, but, in view of the enormous strides made in tea planting in our great dependency, and of the injury caused by the course of exchange, it is scarcely surprising that Mr. Anderson took a somewhat pessimistic tone in regard to the outlook. The commencement of the industry only dates back some thirty-five years, and since then it has advanced by leaps and bounds. At first the progress was steady. Thus in 1863, a crop of about three million pounds was produced; in 1883 it has risen to 59 millions, but last year it amounted to no less than 151 million pounds, and in the meantime had practically ousted the rival Chinese product from the home market: At the present time it is estimated that over £20,000,000 is invested in tea planting, and when it is remembered that it not only forms a source of revenue to Government, but also supports over 1,000,000 natives mostly imported from congested districts, it is evident that due consideration should be paid to the interests of the industry. On the other hand, there are other equally important features to be taken into account, and the question will doubtless be decided on the basis of the greatest good to the greatest number. At the same time it is interesting to note the suggestions for assisting the trade which were offered at the meeting. Mr. Anderson expressed the opinion that the high water mark of the home demand had not yet been touched, and that if the duty on British grown tea were abolished, or, at any rate, greatly reduced, so as to admit of the product being sold at a lower price, a great domand would arise for cheap tea from the artisan and labouring classes in Great Britain. This suggestion is certainly in the direction of inter-Imperial commerce, and as such, would no doubt meet with the appproval of imperial Federationists.

"Desirable, however, as it is to see our colonies and dependencies drawn into closer union, there are obvious difficulties raised by the proposal. Perhaps not the least of these is the fact that during the past year the revenue received by the United Kingdom from the duty on British grown teas amounted to over £3,500,000, and in view of the largely increased expenditure on the Navy, it is scarcely probable that Government will see its way to grant any very material reduction. The opinion that a cheaper article would create a larger demand seems borne out by past experience. In 1890, for instance, a reduction of duty by 2*d.* in the lb. was accompanied by an

increased consumption of 7 per cent. between 1889 and 1891, while a slight rise in the price also occurred, and Sir Patrick Playfair expressed his belief that if the abolition of duty in addition to leaping to greater consumption, had the effect, however temporary, of arresting the fall in values, it might to some extent counterbalance the inconvenience that must at the outset be associated with any legislation affecting the currency system of the country. A difference of ½*d.* per lb. in value, it was stated, was nearly as important as a variation of 1*d.* in exchange, taking current standard values at 8½*d.* per lb. and 1*s.* 4*d.* per rupee. These views, however, will no doubt be fully expounded before the Currency Commission, and it remains to be seen what decision will be arrived at in the matter. Perhaps the most encouraging statement at the meeting was the Chairman's remarks in regard to the Indian and Ceylon tea campaign in the States. According to Mr. Anderson, the consumption of the British grown leaf in North America has nearly quadrupled since 1892, and as a large quantity of these teas is used for blending with those of China and Japan, it is hoped that in the near future we may see a repetition of what took place in this country, and that the British-grown tea will eventually displace its rivals in the Great Republic. That there is a promising field across the Atlantic is obvious to anyone who has visited the country. Among the agriculturists especially of the North American Continent tea is regularly drunk at every meal. Until recently the green teas of China and Japan have been the favourite leaf, but during the past year or so experience has shown that the North American is not indissolubly wedded to the Chinese product, and further energetic efforts to introduce British-grown teas can scarcely fail to largely increase the consumption of our colonial-grown produce."

The following letter from Mr. Geo. Seton, which appeared in the *Financial Times* of Tuesday last, is by way of commentary on the above: "Your interesting article of Friday last on 'the Indian Tea Industry' directs attention, quite properly, to certain possible dangers which threaten this industry, as well as to remedies for these dangers which appear to be within reach. As you truly remark, over-production has for some time 'been held out as a danger.' It might perhaps be more correct to say that it has constituted a grave danger. The prospect, however, of further and increasing danger on this score may now (it is generally admitted) be regarded as being less likely, owing to the decided check which has been given to extension by the unprofitableness of the past season. It may, indeed, be fairly contended that, instead of production being likely to largely outstrip consumption, a steadily increasing relief may be looked for, owing to the strides that are being made in introducing both Indian and Ceylon teas into new foreign markets, as is shown by Board of Trade figures, especially those of the past three months. Your remarks regarding the opening out of North America as a fresh market of consumption are quite correct. May I point out, however, that there are other even more important markets now showing signs of opening up, chief among which are, first, the great Russian Empire; Germany and Scandinavia coming next, with the various Latin countries all likely, in time, to follow. Taking all these together, as well as the widespread British colonies—all expending in population—it may safely be said that the fresh outlets which may be looked for are practically boundless in extent. But, of course, further development of these markets will require time, much energy, and the spending of a good deal of money, either on the part of the 'Liptons,' 'Mazawattees,' and other large distributing agencies, or by the planting communities themselves. As regards the further reduction of the duty, from the purely selfish point of view of the planter, there does not appear to be any very urgent need of this, as the tendency of any such reduction would probably be rather to put a premium on the reintroduction of cheap China teas. As regards the currency question, on which you, sir, appear to have an open mind, the rise in exchange, while apparently telling against profit, will no doubt before long be accompanied by some compensating reduction in rupee cost of production in the shape of lower costs of food grains for the labourers—equivalent, virtually, to reduced coolie wages, while even European salaries, and all European stores, &c., will tend to cost less in rupees—just as they tended upwards during the decline in the value of the rupee."

The London correspondent of the *Ceylon Observer*, ignoring the fact that there is divided opinion amongst tea planters on the duty question, contributes the following reply to Mr. Seton corespondent, Mr. George Seton, is scarcely up to date i markr upon the view tea planters take of the tea duty. 'As regards the further reduction of the duty from the pure point of view of the planter, there does not appear to be urgent need of this, as the tendency of any such reducti probably be rather to put a premium on the re-introduction China teas.' The British India tea planter no longer Chinaman's competition in the British isles. It was at th meeting in the Ceylon Association in London in June last Vice-president Mr. H. K. Rutherford), in a long and in speech upon tea prospects, strongly advocated combined the Planters' Association of Ceylon and India, to agitate reduction, but the total abolition of the tea duty. The now before the Planters' Association in Ceylon, and no time lost in putting it into form, so that relief may be hoped spring. The United Planters' Association of Southern I already passed a resolution in favour of the movement, campaign will assuredly be carried out with that activi British tea planters put into everything they undertake."

CEYLON TEA IN AUSTRIA-HUNGARY.

We give below the report of Mr, G. A. Marinitsch, who was by the Planters' Association of Ceylon to make inquiries best means of extending the consumption of Ceylon tea in and Hungary:—

Kandy, October 6th

Sir,—I enclose copy of Report which has been receiv Mr. G. A. Marinitsch on the subject of his enquiries as to means of extending the consumption of Ceylon Tea in Au Hungary, together with the annexures therein referred t Sir, yours faithfully.

A. PHI

Secy. "Thirty Comm

Vienna, *September 14th*

"Thirty Committee,"

The Chairman,

In compliance with your instructions dated the 9th July pointing me the authorized Representative of the Ceylon Association, for the purpose of making enquiries as to the be of extending the consumption of Ceylon tea in the Austro-H Empire, I beg to submit the following report:—

After a stay of four days at Trieste I proceeded to Vienn city I made my head-quarters up to the 6th July, visitin meanwhile Budapest, Prague, Lemberg, Krakau, Karlsbad burg, Pilsen, etc., etc., all being important centres of the M and at which places I made adequate sojourns.

Everywhere I met with a hearty reception and ready res my enquiries and I desire to place here on record my deep gratitude to Herr Ritter von Mauthner (President of the Chamber of Commerce), Herren Hofrath Ebner von Eben Baron Alexander Koller (of the Imperial and Royal Board o Herr Ritter von Jarsch, General Agent Australian Lloyds C Herr Hemrich Klinger and a host of others who helped a g in affording me statistical and other information and supp with letters of introduction.

I enclose herein two Statistical Statements.

(*a*) Showing the quantities of tea entered for Home cons during the years 1894 to 1897 inclusive,

(*b*) Showing the population of the Empire and giving cities having more than 50,000 inhabitants.

The consumption of tea in Austria-Hungary may at fi appear a small one, if calculated in proportion to the popula if one would take into consideration that coffee (of which ov tons were imported in 1897) is *decidedly the beverage* of the and also the existence of large tracts of wine producing distr quantity of tea consumed should be regarded as satisfactory

From the statement A you will observe that the figures year, when contrasted with those of 1894, show an increase sumption of about 200,000 lb., equal to 10 per cent. in the four years, and such a result may be safely taken as a good the future chances of tea drinking in the country.

There is certainly a distinct inclination towards tea-drinking and e casual observer cannot fail to detect the existence of a desire on e part of some people to drink tea as an alternative to coffee at rtain times, and this change of habit is especially noticeable in the tels patronized by the indigenous population.

So far, however, the wants of the trade have been supplied by ina, the product of which country holds sway as you will gather m the annexed A; the share taken by our own staple being indeed ry small and hardly worth regarding.

I endeavoured to find out the reasons for such a discrepancy, pecially considering that Ceylon tea is well-known to the principal alers, two of whom indeed take nothing else for their private use.

In the course of my inquiries I certainly heard many views, and s also confronted with conflicting statements due no doubt to the sire on the part of dealers to protect "vested interests," but all the me there appears to be a consensus of opinion that Ceylon teas are strong, give too dark a liquor and have a rather too pungent taste compared to the delicate China teas hitherto imported and to ich the palates of the majority of the consumers are accustomed. ere is no doubt that the teas imported from China and sold here in ail, are of very good quality, and of this I had the corroboration the report given by Messrs. G. White & Co., upon a collection of as Mr. Ryan and myself purchased at Vienna and sent on to Mr. . Martin Leake for valuation.

I report the foregoing merely as what is being said by the dealers, t being in any way prepared to back altogether their opinion, cause from my own experience in this line, I have always found at Ceylon teas of superior quality and of high cultivation have eased those who gave to them an earnest trial, and I fully believe, consequence, that Ceylon teas will be appreciated and consumed larger quantities by the bulk of the public, if only properly brought fore them, which has not been the case up to this time for reasons ich it is needless to enquire into more than what is disclosed by e opening remarks of this paragraph, taken in connection with e one immediately preceding.

In actual working however the duty by sea comes to $10\frac{1}{2}d.$ owing the system of collecting the same, which consists of taking the oss weight of the packages deducting therefrom 23 per cent. d charging duty on the remainder 77 per cent. which are consi- red to represent the actual net contents but which are invariably uch more, and thus the duty becomes the heavier in proportion the packages being smaller, so much that for one lb. packets the ty may be fully reckoned at 1*s.* 2*d.* per lb.

This is certainly very excessive, and in the interests of Ceylon I deemed it a good thing to write to call the attention of the thorities to such heavy taxation which is a distinct hindrance to ade.

Unfortunately for our staple the duty on tea in Austria is very avy and certainly acts as a barrier to the natural expansion of the w noticeable tea drinking proclivities, and so long as the duty mains as it is, there are no hopes of a development greater than at is shown by the statistical informations.

Duty on tea in Austria-Hnnkary is as follows:—For teas import- by sea (Austrian Ports) 90 Kreuzers in Gold per Kilogram, ual to $9\frac{3}{4}d.$ per lb. For teas imported by land the duty is 10 per nt. dearer.

I shall not concern myself with the latter as it does not affect r interests nor is it of any real significance as it falls upon im- rtations of so called Caravan Tea and also of small parcels of a coming from abroad per parcel post.

I address therefare a detailed circular-letter to the Principal amber of Commerce of the Monarchy and posted also copies of me to the Imperial and Royal Ministries of Finance and of mmerce. Herewith enclosed I send you also a copy of the said rcular to which I have attached a précis translation for your in- rmation, hoping that you will approve of my action. I have ceived many replies, some being mere acknowledgments, others omising to consider my remarks, but of all answers, the most portant, to my mind, is the one vouchsafed by the Vienna amber of Commerce, and of which I send you the original with translation attached, and from same you will gather that the ienna Chamber has recommended to the Government a reduction 50 per cent. all round in the rate of duty on tea. This very thoritative suggestion in support of my letter-circular will cer- inly produce a good impression with the Government, and I am hopes to hear that the recommended reduction in the tea duty ay become a *fait accompli* some time next year. In the course of an interview I have had since with the President of the Vienna Chamber of Commerce, I have acquired further persuasion that we have in him a good ally in the endeavours to obtain a reduction of the duty. All the teas imported by sea come *viâ* Trieste, where every facility is offered to the trade in the same way as obtained in London and Hamburg, there being a proportion of a huge warehouse specially devoted to the bonding of tea and where also importers can carry on their packing and blending operations, paying duty as the teas go out of the warehouse, and these arrangements give much satisfaction.

I have had interviews with officials at the Board of Trade, who have shown all disposition to see that the tea trade be fostered, and I gathered from them that the Railway Companies will be approached with some recommendations for the treatment of tea transports, and from the Austrian Lloyd Co.'s Directors I have been promised that instructions will be given to the effect that tea be especially attended to. Altogether, I am glad to say that from all quarters I have received assurances testifying to the good disposition entertained towards the development of the tea trade, and the Press is generally in favour of such an expansion.

As a noticeable feature that Ceylon Tea is now being taken into serious consideration I send you a number of the Railway *Gazette* where appears an article referring to the projected new line of the Lloyd Co. between Trieste and Calcutta *viâ* Colombo, and in which the writer refers to Ceylon Tea, as one of the principal articles to be carried by the steamers on that line—considering that I had not the occasion of speaking to the writer of the article, his mention of Ceylon Tea in such a prominent manner shows evidence of the great interest that is being taken in our staple product.

Trusting that the foregoing remarks about the Tea trade in Austria-Hungary may convey an idea of the state in which things stand at present I will now come to the question of the best means for increasing the consumption of Ceylon teas in this Empire.

The only practical manner to attain such a praiseworthy object is to advertise, but the question arises whether the Tea trade in Austria is sufficiently large to warrant any outlay and whether prospects for future development of Ceylon tea here are favourable? My answer will be in the affirmative, there being a distinct inclination noticeable towards tea drinking and such a tendency can only be fostered and increased by advertisements. The desired results will not certainly be immediate, but all chances are in favour of Ceylon tea. The general taste appears now to be entering into a transitory phase, and the opportunity is a very goodone for giving it a direction towards Ceylon tea. As regards the way to be adopted, I have given to the question my best consideration, and for the present I do not think it will be possible to carry out here the arrangement wherewith the Thirty Committee lay out a certain sum for advertising Ceylon tea, provided the parties thus benefited do, on their side, spend an equal sum as that granted by the Committee. The tea trade in Austria is fully cognizant of the qualities of Ceylon tea, but all the same, it will be difficult to find any reliable firm that will promise to deal solely with our staple to the exclusion of China sorts, for, at the very best, the sale will be small at the commencement. To entrust a beginner with Ceylon is not advisable, nor will any old established tea dealer discard China all at once in favour of Ceylon, lest he should lose his clients and ruin his business.

Now, my view of the question is to leave the dealers severely alone and simply advertise "Ceylon Tea" in leading papers, afterwards adding a liberal display of posters and occasionally getting short notices published in the body of the papers relating the great progress made by Ceylon tea all over the world. By this means the attention of the general public will be decidedly attracted to a good purpose, for, judging by human nature many will be those who in consequence of reading the advertisement will ask their grocers for Ceylon tea, and it will not take long before all grocers and retailers will purchase and stock Ceylon tea and sell it as such and not with any other high-flown title. Then the time will come for the Thirty Committee to negotiate with some dealer or dealers who will be prepared to stock solely Ceylon teas and receive a subsidy, in the shape of free advertisements, in exchange of their services to Ceylon tea. The system has been adopted with excellent results for many other new articles such as cacao, soaps, and the like, the introduction of which appeared at the beginning as a work of education surrounded by uphill and other difficulties, but which were soon surmounted by the co-operation of the public curiosity, which is a prime factor in the introduction of new things; I do not mean any disrespect to

Ceylon tea, certainly not, but I reckon a good deal upon human curiosity to help us in the achievement of the object for which we are all striving, namely, the development of Ceylon tea consumption in Foreign Countries.

With regard to the estimates, etc., etc., I cannot quote the figures as I have given all particulars to Mr. Ryan, who will separetely write his views,—I am, dear Sir, yours faithfully,

G. A. MARINITSCH.

PRECIS OF CIRCULAR LETTERS ADDRESSED TO 24 CHAMBERS OF COMMERCE AND INDUSTRY IN AUSTRIA AND HUNGARY.

VIENNA, 1st June, 1898.

By request of the Ceylon Planters' Association I have just concluded a voyage through the most important centres of the Monarchy for the purpose of studying the Tea trade, and I deem it in the interest of the trade to submit to you the result of my enquiries, in the course of which I acquired the very gratifying impression that the consumption of tea was distinctly on the increase, and there were visible signs of a decided inclination towards this beverage.

I was struck, however, by the very heavy duty charged upon tea, and which on the average comes to over 75 per cent. *ad valorem*, and no doubt this heavy taxation prevents the much desired development of the trade.

Doubtless when the tariff was framed, tea was considered a luxury, and, as such, was heavily taxed, but now things have changed, and, thanks to careful cultivation and most perfect machines, tea can be produced cheaper and of better quality and form, now part of everyday requirements in almost every household in the world.

I would therefore suggest that the tariff upon tea be reduced and brought to a point in proportion to other duties now existing; and to stimulate direct importation from the centres of production, I would further suggest that duty on such teas be reduced by 50 per cent., whilst remaining the same as now for teas imported by land or otherwise.

Once the tea duty is reduced, the importations of the leaf will be rendered easier and cheaper. Thus the poorer classes will be the first to benefit from such a reduction, besides avoiding the trade resorting to manipulations, which in some cases contains teas quite deleterious to health.

In the end the State will also be the gainer by the enhanced importations that are sure to follow a reduced duty.

Finally, I beg to point out that in Belgium the tea duty has been abolished since the 1st January of this year.

REPLY.

Translation of reply received from the Chamber of Commerce in Vienna:—

With reference to your letter of 1st June, de pras. z. 6,337 with regard to reduction of the duty on tea in Austria-Hungary, the undersigned Institute beg to say that it has asked the k. k. Ministry of Commerce to submit the matter to the Industrial and Agricultural Board, which is an effective corporation for the consideration of alteration on Custom duties, which will meet soon.

The undersigned Institute have recommended that the duty on tea be reduced without regard to the origin, and to be as follows:—

50 kreuzer per kilogramm for tea imported by land, and
45 " " " sea.

(Signed) The Vice-President: KITSCHEIT.
The Secretary: MARESCH.

COCOA AND ITS ENEMIES IN CEYLON.

THE following is Mr. J. B. Carruthers' Final Report on Disease in Ceylon, now issued by him in continuation of his I Report:—

In preparing a report on the cacao canker, it is difficult to from the facts observed those which teach more clearly the which it is important for cultivators to know, and not to burd pamphlet with an amount of detail which, in some cases, shed a small amount of light on the subject.

I shall endeavour to make this account as popular as is con with accuracy; so that cultivators having a practical a scientific knowledge of cacao, may not lose any information contain.

When my investigations had been in progress for three mo submitted an interim report, and in that described the meth which I endeavoured to discover the nature and life-history disease or diseases attacking cacao, so that in this report, sake of brevity, I need only give the facts arrived at. Any w interested in the processes by which these facts were gained, reading the interim report, trace the method of investigation.

Happily, the statements previously recorded need, in no case, to corrected, and the further information gained as to the life-history the canker fungus, shows that the deductions based on these facts ere trustworthy.

In the first place, I propose to describe the disease as it appears the planter and the effect produced on the tree and its crop; next ving the life-history of the fungus causing it—on the cacao,—the eans by which it spreads, and the conditions favouring it and its crease; and then describe the treatment which, after a series of ried experiments, gave the best curative results—and seems to a reat extent successful; as well as the preventive means which ould ensure that all plantations at present not attacked by the sease, may be kept free from it.

It may be well to state here at once that, in my opinion, the result the investigation has been to show that, though no doubt the resence of the canker will mean an extra expense in cultivation hough not a serious one), it in no way threatens the profitable ltivation of cacao, and we may hope that it will lead to an nprovement in methods and a consequent increase of yield. Of urse, an unknown enemy is always more alarming, but now that e have a knowledge of the nature of the evil, it loses, to a great tent, its terror. The appearance of cacao, both of the Forastero nd Criollo varieties, is well-known to all cultivators, and the umber of deaths due to drought and the attack of insects and fungi as, in Ceylon, extremely small until about five or six years ago, hen some planters noticed a great increase in the number of sual deaths; and this increase went on until it became a most rious matter, and seemed to endanger the profitable cultivation cacao in Ceylon. It was not until the disease had done damage a very considerable extent, that scientific help was asked for, and, doubt, the loss might have been spared in great measure if vestigations had been made soon after the disease appeared, and ot delayed until it had spread over such a large area. This, owever, is nearly always the history of such plant diseases, and ill be so until the experience has been dearly bought—that in lant-life just as in human sanitation, sporadic diseases should be refully observed and measures taken, to prevent them becoming pidemic. It is a very self-evident fact,—but one that requires iteration, that the usual method of cultivation, viz., the unnatural owding-together of one species—favours the rapid spread of iseases due to foreign organisms; and, therefore, makes prompt easures the more necessary.

It is not very easy to estimate the amount of damage done, as, in any cases, by supplying new plants, the estates have partially re-overed, but there is no doubt that a serious monetary loss has been curred, both by decrease of the crop and expense of supplying up iseased estates. I have visited some 40 estates in all districts of eylon, and, though I am glad to say some places have, for reasons terwards mentioned, not been attacked at all—yet in other cases, me estates have been practically wiped out by the canker. That e canker is confined to the stem and branches of the cacao, and oes not affect the roots, is clearly shown by the following facts:—st, when suckers are formed from the stumps of diseased trees cut own, they are quite healthy, and show no sign of disease. 2ndly, ew cacao plants put in a few inches from the diseased trees, grow igorously and without disease, though the roots of the two plants ust be touching in many places; and 3rdly, the examination of any roots of cankered trees showed no trace of the fungus, and all tempts to induce it in roots, by inoculation, failed.

The first sign of the disease apparent to the naked eye is a darken-g of a portion of the cortex of the tree, caused by an excess of oisture immediately below it, and this is usually not accompanied y any "shuck" appearance in the tree. In some cases the cortex has een pierced by insects at the moist places, and this causes an ex-dation at each puncture of a drop of claret-coloured fluid which, hen it runs down the cortex and dries, gives the tree a rusty ap-earance over the dark-spot. If the cortex be shaved off, the tissue ill be found to be soft and of a darkish claret or neutral colour and o full of moisture, that small drops exude from all over the cut sur-ce, which feels soapy and moist to the touch. This condition is due the presence of the mycelium or roots of the fungus in the bark ssues in large quantity. The tree, to replace the damage done to s tissues, sends an abnormal amount of sap to the diseased spot. he existence of such a moist area in the bark means that the dis-se has been for some time—a varying time: in some cases, weeks; others months—in the tree, as it is not until the fungus has got a ood hold of the tissues that such an effect is produced.

This characteristic discoloration of the bark tissues is variable; in cases where the mycelium is only present in small quantity, the colour is very little different from that of the heathly bark, and in many cases, it is impossible for the eye to detect it. When the mycelium exists to any extent, a neutral tint is produced, and this is gradually intensified until, when the fungus has completely permeated the bark cells, the discoloration is most marked. If this infected area is closely observed in the course of time—and as I will shortly point out this time, varies considerably,—a number of whitish pustules will be seen on the surface of the cortex (Fig 1). The pustules are of just about the size of a pin's head, and increase to the size, sometimes, of a large pea; and, as a rule, they become pink later. These are the reproductive bodies of the fungus, and consist of a mass of spores (spores may be, for all practicable purposes, considered as the seeds of the fungus). It is by means of these spores, that the canker spreads from tree to tree. If we examine the tissues of the bark at a diseased spot microscopically, we shall find all the cells, from the cortex to the old wood permeated by their strands (Fig. 2)—almost colourless. The mycelium of the fungus and these are more massed at the points where they have forced their way through the cortex and produced their spore-pustules. The cortex of parts of a tree some eight or ten years old, is, as a rule, slightly cracked in places, and it is at these weaker parts that the spore masses are found protruding. As was mentioned above, these spore-pustules change from a dirty white to a pink colour. In the white stage—which is the first—the spores formed are extremely small, oval or egg-shaped, and formed in chains. In order to afford some notion of the size of these spores—at a rough calculation, about five million, one layer thick, would be required to cover the surface of a ten cent piece. Later on, from behind, second and differently-shaped, spores are formed, which are much larger—about six times the size of the primary spores—and are in the form of a crescent or bent cylinder and septate, *i.e.*, having a number of transverse partitions, usually eight.

If one of the small spores be placed in a suitable medium and kept moist, in the course of from 12 to 15 hours, they begin to germinate, pushing out a tube, which, as it grows, branches frequently, often coalescing with neighbouring branches, and in about 50 hours, producing spores like those from which they originated. Unfortunately, though this method of cultivating and observing the growth of spores is of the greatest interest, it is of less value than observing the growth of the fungus in the living cacao stem (and this is unfortunately impossible) because the rapidity and vigour of growth varies, according to the media employed. Thus, in a water or gelatine culture the spore, in germinating, does not behave as it does in the tissue of the cacao bark, where, of course, the resistance to growth is greater and the nutritive material different.

The method of growth of the secondary spores is very similar, except that a number of tubes are sent out from the spore, even sometimes one from each of the eight chambers into which the spores are divided. As a rule, the growth is not nearly so rapid.

Both these forms of spores are technically called "gonidia." The fungus, however, in addition to producing the simple gonidia spores, has a third and more complex fruit, which will be described later, called "sporangia."

In order to trace the further progress of the disease, if we leave the diseased spots still longer and allow them to spread until they either completely cover the bark or else go completely round the tree, and thus "ring" it and prevent any nutrition passing up to the branches above; then the tree dies—the time taken to kill the tree depends on a number of very varying circumstances and conditions, viz.:—the quantity of mycelium in the affected tissues; the vigour of the remaining healthy portions of the tree; the amount of moisture in the soil capable of being used by the roots; and the damage being done to the tree by other enemies, borers, &c. Clearly, therefore, it is not possible to give any exact data as to the time taken by the fungus to kill the tree, and, in my inoculation experiments (described in my interim report) there was the greatest diversity in the rate of growth even in trees apparently equally vigorous and under exactly similar conditions. In one case, after the tree was inoculated and a diseased spot produced, the area of the diseased portion increased only just a noticeable distance (about $\frac{1}{4}$ inch) every day; in the next tree experimented on, the spot increased its area very rapidly, and in about ten days, covered a space more than two feet long, and almost round the tree. In these cases, however, the difference in time is explicable in other ways also. In the one case, a great many of the spores

used in inoculating the part, may have germinated, and in the other few and, also the condition of the cells, more or less damaged by the cut made for the inoculation, and the quantity of sap they possessed, would naturally influence the growth of the mycelium.

When the tree is being killed by the canker fungus, it exhibits all the symptoms of death from want of nutrition, *i.e.*, the browning of the leaves and fruit, and the gradual drying-up of the bark of branch and stem. Before the bark has quite dried, the third and more perfect reproductive bodies are produced. They are easily recognised with the naked eye, as small crimson spherical bodies, generally in clusters (Fig. 3). They are individually not so large as a pin's head, but a number together are easily detected by their size as well as their colour.

The best place to look for these is on the cortex of old trees and branches cut down because dead.

These spherical bodies are the coverings of the third form of spores, and contain a number of sack-like transparent bodies, which, in their turn, contain each eight spores. These spores are larger than the primary gonidia spores and are uniseptate, *i.e.*, having one division (Fig. 4).

A very large and important group of fungi are characterised by the possession of these spores—asco spores—so called from their being enclosed in asci or the sack-like bodies described above, and, in many of the fungi in the asci group—the formation of gonidia spores precedes the production of the spherical sporangia enclosing the asci.

We have here the complete history of the canker fungus, which passes all its life on the cacao and produces all its three forms of spores there. It only grows on the back of the stem and branches, and not in the root, often spreading down below the surface of the ground to the root, but never invading it and never passing into the leaves.

With regard to the relation of the two varieties of cacao grown in Ceylon, the Forastero with the white or green pod, and the Criollo, or Red, with the red fruit,—both experiments and observations point to the fact that the Forastero is much less attacked by the canker than the Criollo. In fact the Forastero seems more robust in resisting all the enemies of cacao. I have seen a fine Forastero tree towering many feet above its neighbours, all of which were Criollo, and were damaged by the wind. There can be no doubt that the Forastero can be brought to a higher state of cultivation here than the red or Criollo, and all supplies should be of the hardier variety.

With regard to climatic conditions affecting the canker, the matter is one on which, to a certain extent, a misunderstanding exists. There is a prevalent idea in the case of the cacao canker as well as in other specific diseases that an unhealthy, and not vigorous tree is more *liable* to the disease than one full of vigour—this is misleading. There is no proof whatever that such is the case, and it might almost be said that the evidence points more to the infection of healthy trees than unhealthy ones, but it must always be borne in mind that the healthy trees when attacked fight better against the disease, and have more chance to overcome it, whereas, in the case of weaker plants they succumb sooner. *No special pre-disposition of the tree is necessary for the attack of the fungus*, the only conditions needful are moisture and heat. The latter we have always in sufficience in this country and, therefore, it is the dampness as the condition which varies, and which is prejudicial to the tree when considering attacks of canker. The easiest way to understand these conditions is to remember that for all practical purposes the conditions necessary for the germination of a seed are the conditions necessary for the germination of the spores of fungi. In the case of the canker the spores may be blown upon a tree during a dry period, and will, after being exposed to dry air for some time (and of course much more quickly if in direct sunlight), lose their power of germination. If however these spores alight on the cortex of a tree, when the air is charged with moisture, and when the stem itself is damp, it is almost certain to penetrate and infect the tree. With regard to the entrance of the germinating tube of the spore into the bark tissues, there is here a rather difficult point to decide whether the young mycelium can force its way through hitherto unbroken cortex or whether it must find an opening caused by a natural crack an insect puncture, or a casual injury. My experience on this subject leads me to think that in the case of young trees or the young parts of old trees, the mycelium can penetrate but in the case of thicker cortex on old trees there must be some opening by which an entrance can be effected.

In this connection reference may be made to a belief wh current that the period of healthy life of the cacao tree is li to about 15 years. A visit to some of the older plantati Ceylon, twenty years and older, many of which are bearing more per tree than ever before, would dispel this idea, and seems to be nothing to contradict the belief that if the cacao properly treated and has room to grow it should yield good for twice twenty years, and probably longer. In many cases the borers are allowed to ravage the tree without hindranc life of the tree is short, and in most cases where deaths are s so early an age as that mentioned above, it is due to this or external causes.

The most important part of this report to the practical pl however, is the portion dealing with preventive and cu measures.

The conditions necessary for the growth and spread of fung been described above, and these conditions must, as far as po be kept away,—but there are other enemies to consider in gr good cacao, besides the canker *helopeltis*, is in many cases a serious evil, and experience has shown that in many cases whe shade is taken away, the result is such an increase in the num the *helopeltis* that the cacao is seriously damaged. Wind is als injurious to cacao in many places, and make it impossible to g without protecting shade trees. Much depends on the situatio both the enemies. There is cacao in Ceylon growing in the excellent vigour (and this in one of the hottest districts) wit vestige of shade, and where the *helopeltis* does not do much da there is no doubt that the cacao is much safer from danger of attacked by canker when grown absolutely in the open. Ho taking the *helopeltis* as an enemy that must be reckoned with important that the shade employed to keep away this pest s not be too dense, to prevent the sun getting through, and ke the air, and the stems of the trees dry. A light flickering sh in most cases enough to keep away *helopeltis* in great quantity such a shade at some distance above the cacao trees does no the undergrowth at all damp. For wind, of course, belts a most efficacious, and not numerous trees growing among the c

In some cases the cacao trees are placed so near together (I seen cacao 12—15 years old, six feet apart) with the branches lapping each other that, although the overhead shade may be the cacao itself is keeping the atmosphere around the stems and such conditions apart from the cramping effects on the tre most favorable to the increase of the canker fungus.

The preventive measures, therefore, are to keep the cacao conditions which do not favour the germination of the spores. regard to application of fungicides as preventive means, the b these are those having sulphate of copper (blue stone) as their Bordeaux mixture, &c. Sulphate of copper is the most pow fungicide which has comparatively little effect on the external ti of the plant, we know of. Experiments show that spores wil germinate in a solution of copper sulphate containing only one in 500,000. If a thin coating of this substance could be kept on and branch, no doubt this would, effectually prevent the germin of any of the spores on the trees, but the time when the s germinate is the time when there is continual rain, and during periods it is practically impossible to keep the copper sulphate trees—every shower washing it away. Though I am a firm be in the efficacy of copper sulphate as a preventive to fungi, y seems to me that in the case of cacao cultivation, it is not practi

Remedial measures are, in plant pathology, peculiarly ha prescribe, and my time has been mainly occupied since I have be acquainted with the nature of the disease, with this most impo question.

In all cases of canker of bark, whether fruit or timber tree remedy has for many years been surgical, viz., to cut ou diseased tissue—and there is no doubt that in the case of the canker, this is the safest and most effectual remedy. I have several experiments with different substances, applying them nally. In nearly all cases I had no expectation of success, but them, owing to the belief in them held by practical men. In n has there been any success, and it is more than improbable there should be. The mycelium of the fungus permeates all the of the diseased tissue and any substance applied which would ki mycelium of the fungus must necessarily kill the tissue well, and will most probably damage a larger area of bark th attacked by the fungus. The knife does exactly the same wor

n a more efficient manner, and even if a substance which could be trusted to destroy the parts affected were employed, it would be very much more expensive in Ceylon than the cost of labour. Two cases have come under my observation of estates where the canker appeared some two or three years ago, and the plantations have been kept practically free from canker by this method of cutting out, and there is no doubt that, if this had been carried out generally, that the loss by canker would have been inconsiderable.

With regard to the application of tar it is in most cases absolutely harmful, as it acts as a water-proof over the diseased parts, keeps them damp, and the growth of the fungus goes on beneath. It is also a mistake, as it conceals any bad work in cutting out when, for instance, no margin is left.

The above treatment, *viz.*, cutting out all the diseased tissue, and also a good margin of healthy tissue beyond, in order to take away the outlying strands of mycelium, which are not present in sufficient quantity to discolour the bark—has in no case I have seen failed, and I have seen many hundreds of trees so treated; but there are unfortunately many estates in which the trees have been so long diseased, and such a large area of the bark invaded by the mycelium of the fungus that it is impossible, without killing the tree, to entirely remove all the disclosed tissue. In such cases other treatment must be resorted to; but it should clearly be understood that complete excision is the only sure method of curing the tree

In cases where a large area on a tree is claret or neutral coloured, the treatment by shaving the cortex has been tried with varying success, in one estate it has been practised for some three years, with almost invariably successful results.

A sharp pruning knife is the best instrument, though a spoke-shave is very useful when the surface to be shaved is fairly even. All the discoloured part should be exposed, and in addition, a margin of one and-a-half to two inches should be also exposed round the discoloured part, leaving the claret or neutral portion in a frame of healthy bark. This is necessary, as has been already explained, because the mycelium spreads from the discoloured patch beyond, and, unless it is in a certain quantity, gives no clue to its presence by any abnormal colour or moisture in the bark. All the shavings should be strictly collected and *burnt*, as they contain, in nearly every case, on the outside the spores of the fungus.

When this shaving is properly done, the exposure to the air (more especially with very thin shade) dries up the diseased tissue, and in some cases the dry and dead tissue scales out and drops away; while the remainder of the bark, being relieved from its enemy, forms a healthy callus round the injury, and in the course of time, completely covers over the shaved part. This treatment has been tried on a good number of estates, and only succeeds in a proportion of cases. I should estimate about 50 per cent. is certainly not too high. The other 50 per cent., on examining the trees a week or ten days later, the mycelium, though greatly weakened in activity, is found to have spread gradually, and if this is again cut out, as a rule, the fungus is killed. In all cases where this second attempt, or, at any rate, the third has been made to kill the fungus by exposure and without success, the best plan is to cut down and burn the tree, leaving, of course, a stump as far as possible, for the production of "suckers."

The question of growing "suckers" in cacao is an extremely interesting one, apart from the question of the canker; but in regard to the canker, more important still. In my experiments, I inoculated the stems of 30 healthy trees, and 26 of these acquired the canker, but in the case of "suckers," out of ten "suckers" so treated, I only procured the disease in one instance. The infrequency of canker on the suckers, compared with stem and branches even in badly diseased estates, is most noteworthy; and this is a most important recommendation in support of the practice of leaving the suckers, and not as is the usual practice, cutting them out wherever they appear. The whole question is perhaps more for the experience of the planter to deal with, but my observation lead me to doubt the advisability of the hard-and-fast rule to remove suckers from the tree without regard to the respectative requirements of each plant; and in cases of estates where they were left, the health and cropping of the trees seem to me better. So that, when in addition this, we find that the suckers are less affected by the disease, it still further points to the desirability of at any rate trying the plan of allowing trees to produce suckers. One is told that suckers take a long time to produce fruit, but from observations tkken, we find that fruit is borne on suckers very little more than a year old. In all cases where a tree is cut down to a stump, it is well to put in a supply plant, so that, should the suckers not form or not produce a good tree, time will not be wasted.

To sum up the measures which experiments have shown to be of value:—

1*st*. In all cases of cankered trees, to excise all diseased tissue, being careful to cut out all round beyond the discolouration.

2*nd*. Burn all diseased parts so removed.

The treatment by shaving only to be resorted to when the entire removal of the diseased tissue would be likely to prove fatal to a large number of the trees.

The best time for examining the trees is just after the rainy season, when the stems of the trees are dry. It is very difficult to detect any signs of the canker on the cortex when the trees are wet during rains, and the fungus which begins during the damp weather has not had time to produce a noticeable patch. In all estates, there should be an inspection, and in places where the disease is unknown, it would be advisable that an intelligent cooly should be sent to an estate where the canker exists, in order to make himself familiar with its appearance; two or three days with the canker cutting coolies on any good estate, would enable an average coolie to readily recognise it, and he would also learn the most workmanlike methods of cutting out, without doing more damage to the tree than is necessary.

If any doubt is felt with regard to a dark spot on a tree, a slight scratch with a knife will reveal the bark below either healthy or discolored.

There is another advantage attached to this cutting out of cankered spots, which the planter will soon find out. The white borer originates, in the great proportion of cases, in the cankered places, the soft wet tissue there being more easily penetrated. On an estate, therefore, where cutting out the borers has had to be carried out pretty frequently, a great decrease will be found, when all the diseased patches are removed, and the same coolies who deal with the canker can easily add the cutting out of borers to their duties.

Since beginning to write this report I have had brought to my notice a canker on the thorny Bois tree—a tree extensively used for shade in cacao estates—(Erythrina umbrosa)—a canker which on examination, proved to be the cacao canker, and indeed experimentally proved by inducing the canker in cacao trees with inoculations of diseased tissue and spores from the Erythrina. There is no doubt—considering the infrequency of this disease on the Bois, even in estates where the majority of the cacao trees are cankered, that it has come from the cacao to the Erythrina, and not *vice versâ*, but it behoves planters to look to their shade trees, and to treat them surgically as well as their cacao trees whenever they notice any signs in them suspected to be canker.

Though in the first instance these investigations were directed to the canker disease and its effects another disease attracted my notice, and is of great, importance to cacao growers, as it affects the pods, and consequently damages the crop, in some cases to a very large extent.

This pod disease is very easily distinguished from the other enemies affecting the pods, viz., Helopeltis borers and squirrels, &c. It causes a browning of the husk, which, almost invariably, begins either at the stalk, or point of the pod, and not in the middle and is marked by a definite line. (Fig. 5). On cutting the pod open, it is found not to be superficial like the brown, or black marks caused by Helopeltis, but to spread through the entire thickness of the husk, and if it has been going on for a few days affecting and discolouring the seeds also. This disease is caused by the presence of the mycelium of a fungus in the soft tissues of the fruit, the fungus belongs to the same group as the Potato disease.

It produces its fruits of reproductive bodies in the furrows of the pod, where they can be seen as a white mould. On examination microscopically, they will be found to consist of spherical or egg-shaped bodies containing round spores.

Pods attacked by this fungus are completely destroyed in about ten days. An important fact to remember is, that once the pod is attacked by his fungus, the seeds never increase in size, all the nutrition being taken up by the quick-growing mycelium. It is, therefore, of no use to keep any diseased pod on a tree, as no ripening or enlargement of the seed takes place—only increase and spread of the fungus. Very strict measures should be taken on estates where this disease exists, and all pods effected should be taken off directly any sign of the disease is noticed, and *burnt*. By this means the number of spores is reduced, and if carried out for some time the evil should be lessened to a great extent. Of course, as in

the canker, the wet season is the time when this fungus flourishes, in a dry season it is not often met with.

Before concluding this report, I must refer to the great assistance I have received in carrying out these investigations, without which it would have been almost impossible to have gained any of the knowledge which is recorded here. The information afforded by planters has been most valuable. Of the greatest use are records which are usually kept—the rainfall; the crops each month; the deaths due to disease—ravages of insect enemies, &c., &c., all of which led to an increased knowledge in helping cacao to a healthy life. Agriculturists at home might well take a leaf out of the Ceylon planter's book, in regard to these matters.

My thanks are especially due to those planters whose estates I visited, and who, in all cases, added to the pleasure of my visits by their hospitality and kindness.

These investigations have, at times, presented to me disappointing difficulties, but have always been of the greatest interest to me, and with so much still to learn of the cultivation of cacao, and the battle with its various enemies, fungi, insects, &c., I leave my observations and experiments with regret; but still with the hope that Ceylon cacao planters will continue to gain knowledge as to their cultivation, so that they may grow cacao to greater perfection and with increased profit.

J. B. Carruthers.

DISTRICT ASSOCIATIONS.

WYNAAD.

Proceedings of a General Meeting held at Meppadi on 5th October, 1898. Present:—J. W. Hockin (*Chairman*), H. Atzenwiler, A. C. Glenie, R. Lamb, W. R. M. MacKenzie, W. MacKinlay, B. Malcolm, S. Robinson, H. Waddington, E. deFonblanque, *Honorary Secretary*.

Proceedings of last Meeting.—The Proceedings of the previous meeting were taken as read.

Pudu Padi Hotel.—Read letter from Mr. T. J. Ferguson.

Proposed by the Chair, that the balance in hand, Rs.358-5-2, which Mr. Ferguson offers to hand over, be accepted and placed in the hands of the W. P. A. Committee.

Carried.

The Secretary was requested to write to Mr. Ferguson to ask whether the mortgage on Pudu Padi Hotel belongs to the Trust Fund.

Proposed by Mr. H. Waddington, seconded by Mr. E. deFonblanque:—

That, in the event of the mortgage on Pudu Padi Hotel belonging to the Trust Fund, Mr. T. J. Ferguson be requested to transfer it to Messrs. J. W. Hockin and R. Lamb on behalf of the Association.

Carried.

Read letter from C. Shangram.

Recorded.

Roads.—Read letter from the Collector of Malabar on the subject of proposed road from Vellera Mulla to Ernaud Taluq.

Resolved that the subject is outside the province of this Association, but that those persons interested in it would subscribe towards the upkeep of the road after it is finished.

Plague.—Read letter from the Collector of Malabar stating that it is not at present considered necessary to erect a plague camp at Meppadi.

Recorded.

Sultan's Battery Post Office.—Read letter from the Post-master-General. *Recorded.*

"Planting Opinion."—Read letter from the Secretary, U.P.A.S.I.

Proposed by the Chair that the printing of the Ass tion shall in future be given to *Planting Opinion* at same rates as those obtaining at present; and that Association subscribe to the paper.

Proposed by Mr. H. Waddington, seconded by H. Atzenwiler:—

That the Manager, *Planting Opinion*, in future out copies of Proceedings of Members of this Associa as suggested by him.

Amendment by Mr. W. MacKinlay, seconded by E. deFonblanque:—

That the U.P.A. Proceedings be sent to the Mana *Planting Opinion*, and that he be requested to copies to the leading papers, and that no copies be sen the Members.

The amendment was put to the Meeting and lost, the Resolution was carried.

Coffee Robbery.—Proposed by Mr. H. Atzenw seconded by Mr. H. Waddington:—

That the Hony. Secretary be asked to write and req the present Superintendent of Police to take the same s as were taken by Mr. Fawcett to stop Coffee robbery.

Carrie

Small Local Change.—Proposed by Mr. B. Malc seconded by Mr. H. Atzenwiler:—

That the attention of the Collector of Malabar be dr to the fact that no two-anna pieces have been issued regul with the change in payment of money orders at the Office for the past two months.

Carrie

A vote of thanks to the Chair closed the Proceedings

E. deFONBLANQUE,

Hony. Secy., Wynaad Planters' Associat

HELPLESS ON THE SHOALS.

A great steamship, feeling her way in a fog, ran upon a low r bank and stuck fast, about twenty miles from her port. She on board a valuable cargo and nearly three hundred passeng most of whom were almost within sight of their homes. The t came and tried vainly to pull her into deep water. The offi were as able navigators as there had ever been. But she helpless, and it was dead low water. Only one thing could done—to wait. A few hours later the Captain said to his passeng "*The tide is rising*; we shall be off presently." Sixty min more and the ship floated. It was now noon. At two o'cl sharp the impatient voyagers stepped ashore. They might h been delayed longer save for the one fact which the captain announced in four words.

Perhaps this simple and not uncommon incident may contai lesson for you and me. Suppose we draw a little comparison a see. The man who learns nothing from things at his elbow only waste his time going to college.

Mr. William Jordon is grocer and postmaster at Bright Walth Wantage, Berks, where everybody knows him and believes in h On December 7th, 1893, he wrote a letter to a friend, and by cons of both parties we print a part of it.

"In the autumn of 1890," he says, "I had an attack of influe The effects of it lingered with me. I had no heart for anyth I was tired, languid, and weary. My appetite fell away, and w I did eat gave me a sense of tightness and fulness at the chest; bowels were very costive and I suffered much from sick headac Sharp pains often caught me between the shoulders, and breathing was very bad. I kept on with my work, but, on acco of my weakness, the task was doubly hard. For about four mon I was like this, when one day the thought came to me to try

PRINTING—All kinds of Estate Weekly and Monthly Report and Account Forms, executed at our KARAPARUMBA PRESS.

MANURES.

ish Guano. Steamed Bone Meal. Poonacs:—Castor, Mowra, Hoongay. **Saltpetre, Crude and Refined** (Nitrate of Potash.) **rate of Soda. Sulphate of Ammonia. Sulphate of Potash. Muriate of Potash. Superphosphates. Phosphate Powder. Kainits Salts.**

Mixtures can be made in any proportion without extra charge. **Packing** can be done to suit transport by bullocks, etc.

Prices will be furnished on application for delivery either at our Karaparumba Works, Calicut, the Calicut Railway Station, Palghat, Mettapollium, m, or at our godowns in Cochin, Tellicherry, Mangalore and other places.

Quotations will be obtained and orders booked for any Manures not kept in stock. F.r.m.

medicine that so many of my customers bought of me and spoke so highly of. I carried out this idea, and after I had taken one bottle of it I noticed this first of all—*My appetite was better.* I could eat; I relished my food; I got stronger. I took another bottle, and was as well as ever. That is three years ago, and I haven't had a touch of illness since. (Signed) William Jordon."

One more letter—short and right straight to the point. Mr. William R. Saunders writes it. He is a newsagent, and lives at Old Town, Wotton-under-Edge, Gloucestershire. His letter is dated November 7th, 1893, just one month to a day earlier than Mr. Jordon's. That merely happens so, the two gentlemen having no knowledge of each other.

"In the spring of 1891," says Mr. Saunders, "I found myself out of sorts all unexpectedly. I couldn't fancy what had come over me. I was low, weak, and tired. I could eat hardly anything, and what I did eat gave me so much pain and distress that I came to dread sitting down to a meal. There was pains in my chest, sides, and back, between the shoulder blades. Then I got so weak that my work was a sort of drag on my hands; and even when walking I was so short of breath I had to stop and rest here and there. I took medicines the doctor gave me, and pills, &c., that my friends recommended; but it was no use, they didn't help me. And all the time, month after month, I was getting weaker and weaker. At last I got a bottle of medicine from Bristol that was right. That one bottle had this effect at first. *My appetite came back,* and when I got through with the second bottle I was completely cured. (Signed) William R. Saunders."

Now for the lesson. You see what it is of course, but let' it in words. When the ship was fast on the shoal only one helped her—*the rising tide.*

When these two men were fast on the shoal of illness onl thing helped them—*the rising appetite.* With eating and dig came strength and health, for the trouble was that uni destroyer and deceiver, indigestion and dyspepsia.

The *tide* rose to the pull of the moon. The languid *app* roused by medicine finally resorted to by both our correspo —Mother Seigel's Curative Syrup.

MARKET REPORT.

COFFEE.

Messrs. R. J. Rouse & Co's Weekly Coffee Report (*September* 23 says :—The supplies brought forward in Public Sale this week met demand and the market generally was rather easier.

About 600 bags East India were catalogued and mostly sold at irregular prices.

Central American kinds met poor competition and a large pro had to be bought in, the rest selling at 2/- to 3/- decline for comm mixed descriptions, whilst a few bold colory lots realised steady ra

Futures advanced 9d to 1/- during the week on a report that the r at Santos would be very small for the next few days owing to the r not working on account of the damage done by rain, but most advance has since been lost and the market closes quiet 3d to 6d than last week.

FRESH STORES.

A large Consignment has just been unpacked consisting of Oilmansto Tinned Provisions, Luncheon Delicacies, Jams, Crystallized Fruits; a good assortm of Cadbury's Chocolate Drops, Gruyer Cheese, &c., &c.

[w. 1-10-98—t.f.o.]

Messrs. Wm. Jas. and Hy. Thompson's Report of the Colonial Markets for the eek ending September 21st, 1898, says:—Bank rate 2½°/₀. Bombay change closes at 1s 3 15/16d. Brazil Exchange 7 23/32d. Rupee paper 3½ °/₀ ¾. Silver 28 5/16d per oz.

A quiet tone has prevailed throughout the past week, and although ices have shewn some irregularity, no alteration can be reported. Fine owths continue to meet with good competition. Brazil markets ıtureless.

Futures have fluctuated, closing firmer at a decline of 3d to 9d per cwt., :—Good average Santos in Havre, December delivery, fcs. 38.50, in ımburg pf. 32, and No. 7 low ordinary Rio in New York $5.85.

Daily receipts averaged 14,000 bags in Rio, and 32,500 bags in Santos.

To-day's London official quotations are :—

London advices of 23rd ultimo state :—A generally dull tone has prelled in this market and the supplies at auction, which as a rule esented little attraction to the trade, were only partly disposed of. ıst India did not realise valuations. Costa Rica sold very slowly, even e fine home trade qualities for which low bids were generally made, sulting in the withdrawal of large quantities, and mixed grades were cidedly cheaper. Colombian and other Central American brought about te values for desirable lots, but easier prices for the ordinary descripıns. Futures opened flatly, but for a day or two there was a stronger eling, and prices advanced 6d to 1s per cwt., owing to a land-slip which likely to delay Santos shipments; at the close, however, the tone has ain become flat, and the improvement in value has not been maintained.

TEA.

From London advices of 23rd September we learn :—

China.—Congous still continue devoid of any particular interest, demand showing no signs of improving. Green teas at auction have sold cheaper for new season's, the quality of which does not increase in popularity; old season's, on the other hand, exhibit some increase in price.

At public sale during the week 5,165 packages have been offered and partly sold :—

Indian.—A slightly larger quantity was brought forward comprising 39,200 packages, against 38,800 packages in the preceding week and 47,300 packages at this time in 1897.

There was fair competition for nearly all descriptions, values being generally maintained. Quality from many of the Assam gardens shows a falling off compared with that of previous invoices, but Darjeeling was represented by some choice shipments which met with some strong bidding, regular buyers of this class being very anxious to secure them.

Most of the Dooars continue to be useful. Cachars and Sylhets, however, on the whole remain poor in cup.

For 30,600 packages on Estate Account 8⅞d per lb. was obtained *versus* 8¾d per lb. for 35,500 packages and 10¼d per lb. for 27,200 packages in the two former seasons.

CEYLON.—Public auctions included 21,900 packages, whereas on the 13th inst. 15,700 packages were offered, and 19,700 packages a year ago.

The improved flavour observable in many of the Teas coming to hand was appreciated by the trade, and in consequence the sales passed with a firmer tone. Orders from the Continent were more plentiful, and though they could not always be executed gave support to the market. Common to fair Pekoe Souchongs and Pekoes were in request and scarcely obtainable on last week's terms. Medium to fine Pekoes and Orange Pekoes in most instances were decidedly dearer. Coloury Broken Pekoes and any lines with attractive infusions commanded considerably higher quotations, the following being some of the most noticeable for Broken Orange Pekoes, viz.:—Talawakelle, 1s 7½d; Dimbula, 1s 7d; Ingestre, 1s 6½d; Wootton, 1s 6¼d; Hauteville, 1s 5¼d and 1s 4½d; St. Clair, 1s 5d; Campion and Ythanside, 1s 4¾d; Holmwood and Hope, 1s 4d per lb.

The average is 8¼d per lb. On the 15th instant it was fully 8¼d per lb. and also on the 22nd September, 1897.

Java.—Rather over 1,300 packages of direct import were submitted to buyers, which met with good competition and brought prior to hardening rates. No further catalogues are at present issued.

Deliveries.

The clearances of all Tea (on which duty has been paid) from the London warehouses, as per official returns, were:—

From 1st to 20th Sept., 1898.....11,005,369 lb.
„ „ 1897.....11,665,136 „

During the week the following have been printed for sale by public auction:—

	Sold. Pkgs.	Withdrawn. Pkgs.	Total offered. Pkgs.
India	35,545	3,687	39,232
Ceylon	20,904	973	21,877
Java	1,249	98	1,347
Total	57,698	4,758	62,456

Also 252 packages from second hands.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea Report, dated September 16th, 1898, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Java.
1898-1899.	295,662 pkgs.	383,842 pkgs.	14,135 pkgs.
1897-1898.	290,475 „	427,417 „	14,036 „

39,496 pkgs. Indian
16,260 „ Ceylon
898 „ Java.
} Total 56,654 packages were offered in public auction this week.

Imports, duty payments and exports from the commencement of the season, as given by the Customs figures, are shown below. There is a marked increase in the export of Indian and Ceylon Tea.

Indian. This was the heaviest auction so far held this season. Good liquoring Teas continued to attract most attention and sold without alteration, but quotations were rather lower where invoices showed a falling off in quality. Although some very fine Teas from Assam and Darjeeling have lately been sold, musters indicate some falling off in quality. The following averages may be mentioned:—"Amal T Co. Dooteriah," 2/1½; "Poobong," 2/2; "Selimbong," 1/10¾.

Total Tea sold on Garden account 1st June to date 1898, 197,548 pkgs., av. 9d. 1897, 198,136 pkgs., av. 9·18d.

		1898.	1897.	1896.	1895.

PEK. SOUG.	(Blackish greyish, useful liquor).	6½d	6¾d	7¾d	7d
PEKOE.	(Greyish to blackish, some tip, useful liquor) ...	7½d	8¼d	9¾d	8d
PEK. SOUG.	(Blackish greyish, inferior liquor).	5d	4¾d	5¼d	6d
PEKOE.	(Blackish greyish, some tip, inferior liquor) ...	5½d	5½d	6d	6½d

Ceylon. An unusually small auction contributed to strengthen the market, while several Teas of an attractive character induced spirited competition, quotations advancing for better liquoring sorts, while Teas for price were frequently dearer. An official wire reduces the original estimate of this year's crop from 126 million lbs. to 119 million lbs. Direct shipments to foreign countries are about 4 millions ahead of last year. Averages:—"Carolina Tea Co. Goatfell," 1/2¾; "Henfold," "Nayabedde," 1/-. Average for week 8·28*d.*, against 7¾*d.* same period

Ceylon Tea sold on Garden Account 1st January to date 1898, 8 pkgs., av. 7·62*d.* 1897, 825,297 pkgs., av. 7·60*d.*

		1898.	1897.	1896.
PEKOE SOUG.	(Ordinary leaf; fair liquor) ...	6½d	6¼d	6¾d

PEKOE SOUG.	(Rather bold leaf; indifferent liquor) ...	5¼d	5d	5¾d
PEKOE.	(Somewhat bold leaf; indifferent liquor) ...	5¾d	5¾d	6¾d

Java. The small auction passed with good spirit at firm prices.

Messrs. Gow, Wilson and Stanton's Indian, Ceylon, and Java Tea R dated September 23rd, 1898, says:—

QUANTITY BROUGHT TO AUCTION IN LONDON
FROM 1ST JUNE TO DATE.

	Indian.	Ceylon.	Jav
1898-1899...	335,161 packages.	405,915 packages.	15,482 pac
1897-1898...	337,835 „	447,611 „	14,743

39,499 *pkgs.* INDIAN
22,073 „ CEYLON
1,347 „ JAVA
} Total 62,919 packages, were offered in auction this week.

Home consumption from the 1st January shows an improv particularly noticeable in Indian Teas. Re-exports of both Indi Ceylon Tea have also materially increased.

Recent advices both from India and Ceylon indicate only mo shipments to this country. The moderate prices at which good liquoring Teas can now be purchased should increase their consu in the United Kingdom, and promote their use in external markets

Indian and Ceylon Tea (in lb.) exported from Great Britain, from 1st January to 31st August.

	1898.	1897.	1896.	
Indian ...	4,319,045	3,281,688	2,083,717	2,3
Ceylon ...	7,644,380	6,837,476	5,206,535	4,5

Indian. No quotable change has taken place from prices curre week; competition was fairly general, but ran principally upon liquoring Teas. The official wire gives exports to U. K. for first September as 10,250,000 lb., against 9,960,000 lb., making the tota 1st April to date, 58,167,000 lb., against 58,150,000 lb. for the period last year. The following averages may be mentioned:—"Poo 1/6¼; "Arya T Co.," 1/5¾; "Pabojan T Co.," 1/4¾.

Total Tea sold on Garden Account 1st June to date 1898, 228,388 av. 905d. 1897, 235,060 pkgs., av. 9·13d.

		1898.	1897.	1896.

PEK. SOUG.	(Blackish greyish, inferior liquor).	5d	4¾d	5¼d
PEKOE.	(Blackish greyish, some tip, inferior liquor) ...	5½d	5½d	6d

Ceylon. There was an appreciable improvement in quality tending to raise quotations and produce a generally better tone. good bidding the market hardened a little, and all grades must be slightly firmer. Private telegraphic advice gives exports to U. first half of the month as 3,500,000 lbs., against 3,000,000 lbs. fo period, 1897; and estimates the quantity available for whole mo 6,750,000 lbs. Averages:—"Udaveria," 1/1¼; "M C Co Mahadd "Nayabedde," 1/1; "ST Co St. Leonards," 1/0¾. Average 8·34d. nearly 8¼d. same period 1897.

Ceylon Tea sold on Garden Account 1st Jan. to date 1898, 8 pkgs., av. 7·73d. 1897, 844,692 pkgs., av. 7·62d.

		1898.	1897.	1896

IN AUSTRALIA.

Messrs. Alfred Harvey and Co. state in their Monthly Melbourne Tea eport :—

Shipmets from all ports are 11,716,000 lb., as against 10,140,000 lb. at ame time last year.

The *Argus* arrived from Calcutta on the 10th with 450,000 lb., of hich one-half is for Melbourne, which quantity will be sold publicly on he 15th and 23rd. The *Bhundara* and *Fazilka* are also afloat, which ring the shipments to the Colonies up to 1,956,000 lb. The market in alcutta is somewhat easier for the better grades, but remains strong for he commoner sorts.

Ceylons have been in short supply, the continually firming market in olombo and the scarcity of freight checking buyers. Very high prices ow rule for all common kinds, except Dust, and the market keeps firm at ull rates for all higher grades.

Chinas are still arriving in restricted quantities. The *Changsha* rrived on the 25th August, and the *Australian* on the 9th September. he market in Foochow is also reported as very firm at high prices for all emaining stocks, which latter are now reduced to smaller demensions han at any previous time at the same date.

The outlook is in favour of short supplies of all kinds of leaf through the igh rates ruling at the various ports of shipment, and consequently a rm market at probably higher prices in all the colonial market; and ealers should not overlook the position of stocks in bond, which appears ingularly favourable for speculators to operate upon.

Stocks in bond on the 3rd September were 1,381,363 lb.

SYDNEY, *September 17th.*—Messrs. Alfred Harvey & Co. held a sale of ea at the Chamber of Commerce sale-room yesterday, at which there was good attendance of the trade and a moderate clearance was effected at atisfactory prices. The selling brokers report :—"We offered on account Dalgety & Co., Limited, 265 packages Ceylon, and sold 165 packages at ¼d. to 10¼d. We also offered on account Messrs. A. Tange & Co., and the olombo Commercial Company, 146 packages Indian and 258 packages eylon teas." All the Indians were sold from 6¼d to 7d, and 133 ackages Ceylon from 7¼d to 1s 0¾d.

SYDNEY, *September 20th.*—A little inquiry was made for tea privately, nd sales were mentioned of 300 packages of China at 6d to 7d; also 50 three-quarter chests at 6¾d, and 25 half-chsts of Ceylon Rroken Pekoe at 13½d.

MELBOURNE, *September 21st.*—About 1,050 half-chests of common to good Panyong tea was quitted at full rates, and 225 packages of Ceylon at 6½d. to 9¼d.

PEPPER.

London advices of 23rd September say :—

Black.—There has been more business doing this week, but at lower prices. Singapore on the spot has been sold at 4⅝d to $4\frac{11}{16}$d for fair, at $4\frac{11}{16}$d August-October (s.) $4\frac{25}{32}$d to 4¾d September-November, at $4\frac{13}{16}$d to $4\frac{29}{32}$d October-December, and at $4\frac{29}{32}$d to $4\frac{15}{16}$d for November-January. Sales 300 tons. The market at the close is firm, and sellers now ask $\frac{1}{16}$d advance on above quotations; $4\frac{23}{32}$d reported paid for Singapore on the spot.

At auction on the 21st inst., 455 bags Singapore were bought in at 4¾d, also 451 bags Penang at 4⅜d, and 397 bags Tellicherry at 4¾d per lb.

White has also been sold at easier prices, but is firm at the close. About 200 tons have been disposed of during the week, embracing Singapore at 8d to 8⅛d for fair on the spot, at 8⅛d near at hand and August-October, at 8⅜d to $8\frac{7}{16}$d October-December. Siam at 8⅜d September-November, and at 8½d for November-January. Penang at 7½d to $7\frac{9}{16}$d on the spot, at $7\frac{17}{32}$d to 7⅝d August-October shipment, at 7⅝d to $7\frac{11}{16}$d September-November, at 7⅝ to 7¾d October-December, and 7⅝d to 7¾d November-January.

At auction on Wednesday 42 bags Singapore passed the hammer unsold at 8⅛d, and 80 bags Siam at 8⅛d; of 69 bags Penang, a lot or two sold at 7½d per lb. for fair.

No sales. Of Singapore White, sales of October-December shipment at $8\frac{7}{16}$d. Penang easier. 30 tons November-January shipment sold at 7¾d and sellers.

GINGER.

Cochin.—In London reports of 23rd ult. we find it stated :—Medium sized cut, which has maintained a very firm tone for some considerable time past, was quitted at lower prices, but other descriptions showed no alteration. Catalogues included 67 cases 477 bags, of which 39 cases 200 bags found buyers as follows :—medium cut and scraped slightly wormy 55s, medium and small rather roughly cut and scraped limed and slightly wormy 43s 6d; medium and small some bold washed rough, 23s to 23s 6d, ends ditto 19s 6d, medium and small Calicut rough 20s 6d, common ends and shrivelled ditto 17s 6d per cwt.

Jamaica quiet. 139 barrels offered, but only 13 barrels sold—middling washed 70s to 73s 6d, ordinary 66s per cwt.

SUBSCRIPTION.—Advance Rates: Yearly, Fifteen Rupees; Half-yearly, Eight Rupees; Quarterly, Five Rupees, and Monthly, Two Rupees, including postage. Single Copies, Eight Annas.

ADVERTISEMENTS.—The charge for line advertisements is 4 as. per line for the first, 3 as. for the second, and 2 as. for the third and succeeding insertions. Five-line (or shorter) advertisements from Subscribers will be inserted for three issues for one rupee; non-Subscribers will be charged two rupees.

DOMESTIC OCCURRENCE.—The fee for inserting a domestic occurrence will be *One Rupee* for each insertion, payable in advance.

N. B.—Remittances should be sent to E. C. Duft & Co., Proprietors, "Planting Opinion," 16/17, Armenian Street, Madras.

SEASON REPORTS.

TO OUR SEASON REPORTERS.

Please post your next reports to reach Madras on Friday, the 28th October, 1898.

Season Reports should be sent to the Printers, Messrs. ADDISON & Co., direct, and not to *Planting Opinion* Office.

South Mysore.

MUDIGIRI, 15*th October.—Weather.*—Still more rain than usual, generally at night or late in day. There can be no doubt that late extension of showers is a good thing for our coffee here, even if a little temporary annoyance is caused, but this constant rain is quite another matter. Once a week, or perhaps twice in ten days, is all we want. Digging should be general now, and frequent rain is most undesirable. *Diseases, &c.*—I hear of leaf-disease increasing in some quarters, but from others hear that coffee is thriving. I see no increase myself, and, as this is not a season when one has much leisure for travelling, I am dependent on casual correspondence for information. If the east wind sets in late, hope we shall not have a severe "second go." This has been a great insect year; the cicadas were never so vociferous in any season before, and I have never seen so many spiders and snails as there are now. The former may do some good by strangling an occasional borer fly, but the latter are destroying a small quantity of coffee (prematurely ripe stuff). They seem to suck all the cherry off, so that the beans fall to the ground. I have caught many of them at it this year, but have never noticed it before. *Labour supply* seems to be ample and *Health* good. The plague scare, or rather the inoculation scare, is in full force. There has been one suspicious death (rumoured) in Chickmaglur, which was at once magnified by some of the bad characters of the place into eight deaths from forcible inoculation. The usual story is told that Her Majesty's life is in danger this year, and that a "Ner Beli" or human sacrifice of seven lakhs is required to avert disaster; also that a different and harmless kind of serum is used for Europeans and all who offer themselves at first, and a malignant poison for the others. A correspondent writing about shade says that *Cedrela Toona* is out of leaf in January-February. His must be much later than mine, which are quite thick then. I am one of the strongest objectors to them, because I find that practically coffee under them crops badly though it generally looks well. My idea is that the sudden fall of leaf at

the end of the monsoon (they are bare bones now) results unless great care is taken in a caking of the surface soil still wet from the present or recent rain, and a premature hardening of the wood. The Taree (*Terminalia bellerica*) loses its leaves nearer the time mentioned, and I find coffee under it often pays well. The soil is drier then, and less liable to cake. In addition there is, of course, a nice mulching deposit which the *Cedrela* does not give to such an extent, and besides a hardening of the wood in January is to be desired, and in some situations not always obtained under shade. The *Cedrela*, as your correspondent implies, is a very long time out of leaf. *Grain.*—I have no change to report; the rain seems to be excessive in the maidan, and ragi is said to have been damaged in parts.

ELECTRIC NITRATE.

In his recent address, the President of the British Association, 1898, opened up a new field of scientific speculation and experiment. Indeed, he almost hinted that speculation and experiment were at an end, and that it only remained for capital and science to reap a rich harvest from recent discoveries. Some of his remarks have already been noticed in our columns, but if in giving a brief summary of his suggestions we reiterate to some extent, our readers will scarcely blame us, for the subject is of surpassing interest to planters in South India. It is no less a subject than the artificial production of nitrate. This, it is said, is clearly in view, and at a cost that will compare favourably with the prices current for Chili nitrate of soda. Despite the assertions of sceptics, the immense benefit arising from the use of this product for manurial purposes has been fully proved. For instance, the action of nitrate of soda in improving the yield of wheat has been studied practically by Sir John Lawes and Sir Henry Gilbert on their experimental field at Rothamstead. This field was sown with wheat for thirteen consecutive years without manure, and yielded an average of 11·9 bushels to the acre. For the next thirteen years it was sown with wheat, and dressed with 5 cwt. of nitrate of soda per acre, other mineral constituents also being present. The average yield for these years was 30·4 bushels per acre—an increase of 24·5 bushels. In other words, 22·86lb. of nitrate of soda produced an increase of one bushel of wheat. Planters in Southern India are, we believe, largely believers in a fairly liberal use of nitrates, and though we give on another page an extract showing what can be said from the "opposition" point of view, our opinion is that experience in the coffee districts of India justifies the belief that an addition of nitrates to an exhausted soil is in many instances highly beneficial to its cropping capabilities. the question of the duration of supplies from Chili has frequently raised, and as 20 to 30 years appears to be a estimate, it is obviously important, in the face of stea increasing population, that other fields of supply shoul sought or made.

Sir William Crookes points out that nitrate of so the only available compound containing sufficient nitrogen to be used on a world-wide scale as a nitro ous manure. He then proceeds to state that in its state nitrogen is one of the most abundant and per ing bodies on the face of the earth. Every square of the earth's surface has nitrogen gas pressing o on it to the extent of about seven tons. The problem, is to harness the nitrogen of the atmosphere, to fix it in manner that it may be turned to practical use by agr turists. Attempts in this direction have been made for y past with more or less success. A certain amoun atmospheric nitrogen *can* be fixed by several meth but so far every method has proved too costly. Here that the President of the British Association comes to front. Years ago he showed that nitrogen is a combus gas. He now adds:—"The reason why when once ignite flame does not spread through the atmosphere and de the world in a sea of nitric acid is that its igniting poi higher than the temperature of its flame—not, there hot enough to set fire to the adjacent mixture. Bu passing a strong induction current between terminal air takes fire and continues to burn with a powerful fl producing nitrous and nitric acids." He further sugg that this inconsiderable experiment may not unlikely le the development of a mighty industry destined to the great food problem. With the object of burning nitrogen from air so as to leave argon behind, Lord Rayl fitted up apparatus for performing the operation larger scale, and succeeded in effecting the union of grammes of mixed nitrogen and oxygen at an expendi of 1 H. P. Following these figures, it would require Board of Trade unit to form 74 grammes of nitrate of s and therefore 14,000 units to form one ton. Workin this basis, dismissing electricity from coal and steam eng as too costly for large industrial purposes, and referrin Niagara, where water power is used, Sir William Cro observes that there electricity can be sold at a profit one-seventeenth of a penny per Board of Trade unit. this rate nitrate of soda would cost not more than £5 ton. But, he adds, the limit of cost is not yet reached, it must be remembered that the initial data are derived small-scale experiments in which the object was not econ but rather to demonstrate the practicability of the com tion method, and to utilise it for isolating argon. now electric nitrate at £5 a ton compares favourably Chili nitrate at £7-10*s.* a ton, and all experience shows when the road has been pointed out by a small labora experiment, the industrial operations that may follow always conducted at a cost considerably lower than c be anticipated from the laboratory figures. As to whe sufficient electricity can be generated to draw enough ni from the inexhaustible stores of the atmosphere, Sir Wil points out that Niagara alone is capable of supplying required electric energy without much lessening its mig flow. And this to bring about a production of 12,000 tons of nitrate of soda annually.

Proprietors, "PLANTING OPINION,"

Nos. 16 and 17, Armenian Street., Madras

Having thus shown that this authority considers electric trate a commercial possibility, we go back to our remark hat the subject is one of special interest to the South ndian planter. That he requires nitrate of soda, is well nown; that his consumption of it would be greatly in-reased if the cost were appreciably less than it is, will be eadily admitted. The points to be considered are, whether e can obtain all he wants, and at a price that will render s use profitable to him. Granted that electric nitrate is roduced and offered in the markets of the world at a low rice, the South Indian planter will certainly be numbered mong buyers. Whether, however, he will try the Niagara roduct will depend upon its cost *delivered on the estate.* t is possible that the huge water-power of the Periyar roject might be brought into rivalry with Niagara. We annot for a moment suppose that the cost of the electri-ity produced at Periyar would compare favourably with hat produced on an immense scale at Niagara. If, how-ver, we set against the difference of cost the expense that ould be incurred in bringing nitrate of soda from Niagara to South India, we see that Periyar starts with a erviceable handicap. If, therefore, further experiment hould prove Sir WILLIAM CROOKES to be right, and lectric nitrate should become a commercial product, we nay reasonably hope that the capabilities of Periyar as a roducing centre will not be overlooked. We would, how-ver, express the hope that when further experiments are nade on the lines of Sir WILLIAM CROOKES's suggestions, some ttention will be given to the question whether a with-drawal of nitrogen on a very large scale from the atmosphere n a particular locality would be likely to have a marked effect, either beneficial or prejudicial, on human health in hat locality.

COFFEE ESTIMATES.

THE remarks of "M" in our correspondence columns are no doubt a fair exposition of the views of Indian Coffee planters with regard to the subject of Coffee Estimates. It is noticeable that "M" observes that the fact of publishing estimates would cut both ways in regard to the course of prices in consuming markets, but does not remark the same concerning the effect with respect to planters personally. Apparently he holds that these gentlemen would be as averse to publication of their successes as to the public announcement of their non-successes. It may be so. We can only say from the point of view of the outsider that the reluctance manifested in the matter of giving estimates appears regrettable and shortsighted. "M's" letter clearly shows that such estimates would convey to the initiated alone an idea of the incomes of individual planters or the fertility of particular districts. They show that even experts might be misled: they might then be liable to overvalue as well as to undervalue. So we have the "cut both ways" again! Then "M" asks, would there not be speculations in "arrivals" if crop estimates were forthcoming. In all probability there would, but we have yet to learn that planters would be losers thereby. They might if they misjudged the position, but if they gauged it accurately they might just as easily be gainers. However, our anticipations will be fulfilled if our coffee friends say, "No estimates."

GAINERS BY EXCHANGE.

WITH reference to "Observer's" remarks in past and present issues, we may say that it is not our desire to encourage discussion on the Currency Question in these columns. It may appear to us desirable to throw out a suggestion now and then, but the Currency problem can be better discussed in the daily press than in a technical journal. The aim of planting currency-reformers should be to convince the general public, not to appeal to planters themselves, whose purses have served as admirable currency barometers. At the same time, it may be well for us to state that we do not hold that high exchange is beneficial to India as a whole. On the other hand, however, we are satisfied there is a limit below which the rupee cannot fall, just as there is another limit above which it cannot rise, without positive harm and loss being inflicted on the country. What the happy mean is we have so far found it impossible to determine. It is a matter that could probably only be settled after some years of careful watching of the movements of an untrammeled, *natural* currency. The main point our recent article on "Gainers by Exchange" was meant to bring forward was that, be the profits of producers what they may when Exchange declines, the profits of holders of land under the Permanent Settlement must be immensely increased, and that thus low Exchange at least tends to enhance the evil effects of one of the biggest administrative blunders ever perpetrated in India. In view of "Observer's" latest remarks, it may be well to add that the "Zemidnars of Bengal" are by no means the only gainers by the Permanent Settlement. We do not reprint the article on "Cheap Silver in Mexico" referred to by our correspondent, for it seems to us that the recent prosperity of Mexico is due to very different causes from a mere "fall of Exchange." Nor does it appear necessary or desirable for us to inflict upon our readers a treatise on political economy. Our object has been, and will be, to remind planters that there are other interests besides their own, and those of agriculturists generally, to be considered; and that they would be wise not to argue in a one-sided manner, but to show from the first that inclination to recognition of conflicting interests, without which no proper settlement of the Currency problem can be arrived at.

COFFEE IN THE STRAITS.

IT is reported from the Kuala Lanyal District that, from the pepper and gambier estate at Sepang, the greater part of the land taken up has been planted with coffee or coconuts. Much of the land planted with coffee by Malays has been sadly neglected by the owners. Coffee cultivation is eminently unsuited to Malays, who will not devote the labour and time required to bring the trees into bearing. The general idea amongst them seems to have been that they had only to plant up an acre with coffee and sit down for a year or two, in order to realise a fortune. Experience has, to a very great extent, now disabused them of this notion, and it is not anticipated that many fresh applications for coffee land will be made, nor will such applications be encouraged. On the two European estates at Telok the coffee is still young; but some 70 acres belonging to Mr. Borring, which came into bearing, is reputed to be as

fine as any coffee yet produced in Selangor. In the Ula Langat District there are five European-owned estates, and the total area of coffee under cultivation at the end of the year was 1,435 acres. Part of the Kuala Selangor District would appear to be unsuited for coffee-cultivation. An official report states :—"Javanese who took up land on the Bukit Rotan Road and planted it with coffee, which was destroyed by flood water, the drain having been dammed by the Public Works Department to use as a canal for transport of metal, have now most of them planted coconuts as also have many others who hold land on the inland side of the Coast Road which, as my predecessor pointed out, acts like a long dam from Sabak to Kapar, as if built purposely to prevent the water getting to the sea. By planting each coconut on a mound six feet high it has a chance to get a start without being flooded; but you cannot grow coffee like that." Mr. Francis Welford's coffee estate at Kampong Nior is improving; the whole estate will be very soon completely drained, which will allow the land to be worked more effectively. Mr. Welford has now about 100 acres of coffee planted. Mr. Tollemache has done a good deal of draining, felled his first block, and has a fine nursery ready to plant out; his bungalow is now completed. Mr. Tanner, who purchased two of Mr. Jackson's blocks, is just commencing work. Mr. Jackson's other block has not yet been started. Agriculture in Ulu Selangor District consists principally at present of small Malay coffee gardens, inter-planted with fruit trees; and bearing, where an acre or two of swampy land presents a favourable opportunity, a small crop of "padi." Except at Ulu Yam and Ulu Bernam, there is no serious attempt at rice cultivation on any considerable scale. The combined effects of the low price of coffee and the high price of rice, generally prevalent during 1897, were severely felt by the owners of these small plantations, and there is now little or no demand for coffee land. Many of the planters realise that their chief interest should lie in the production of a sufficient quantity of rice to render them independent of the market outside. Titles for Mr. Pasqual's coffee estates at Serendah were prepared and issued during 1897, and applications were received and registered for additional blocks from him and from Messrs. Melkle and Glassford, who are planting coffee at Batang Kali.

NOTES.

Coffee Prospects. The American *Grocer*, after giving statistics showing the World's supply of coffee on 1st September, adds :—"These figures show a total visible supply equal to about one-half the world's production—a pretty good insurance against any rise in price until there is a marked failure in production."

Ceylon Tea Estimates. The Kandy correspondent of the *Ceylon Observer* wired on 14th instant :—The weather is changeable, part of the days being wet and part sunny. The estimate of the Tea Crop is likely to be realized. October and November are expected to be good months. The bug in lantana is very bad in some places and is spreading to other plants around Kandy.

Calcutta Tea Sales. The average at the auction of 5th instant was As.5-4 pies. On 12th instant 18,300 packages were sold. Bidding was brisk at rather firmer rates than last week, good kinds being keenly competed for. There was a fair demand for Bombay and other outside markets. The average of the last tea sale was 5 annas and 8 pies. Nineteen thousand packages were to be offered at the sales on Tuesday last.

The British Tea Duty. *Apropos* of the question of the Reduction of the British Tea Duty Mr. Wm. Mackenzie reports that the press in Canada is taking up the question of a differential duty in favour of British-grown teas. That is by no means what is wanted and it is to be hoped that British tea-growers will protest. They claim fair-play in regard to the Currency question let them not claim anything else in respect to duties.

Coffee in Zanzibar. About 60 young Arabian coffee trees are growing in the Nursery from seed obtained from Nyassaland. They look well and will be planted out, though they can hardly be expected to prosper in Zanzibar as the elevation is too low. Liberian coffee was sown late in the year and has not yet germinated. Attempts have been made to procure seed of the Maragogipe coffee, Brazilian variety, but none has yet been received.

Colombo Tea Sales. At the public sale of tea at Colombo on 12th instant, about 7,809 pkgs. = 612,019 lb. were offered, of which about 6,486 pkgs. = 505,776 lb. were sold. The sale again passed off with a very firm tone for all grades. The finest teas in the sale were: Iona, Middleton, High Forest, Hornsey and Agra Ouvah. Amongst low-grown tea some of the best were :—Fred's Ruhe, Arapolakande, Polatagama and Clyde.

Coffee Nurseries in Mexico. A pamphlet recently issued by the Mexican Gulf Agricultural Co states that the nurseries of Dos Rios are the largest in the world. They contain 5,000,000 coffee trees and 500,000 rubber trees. Three tons of coffee were planted for seed. Figures: coffee trees planted in Sitio 1, 850,000. 860,000 trees planted in Sitio 3. Rubber trees planted in Sitio 1, 125,000. 175,000 trees planted in Sitio 3. Labourers employed in 1897, 350. $36,200 worth of merchandise sold in our store in 1897.

Check Rolls. An old subscriber to a Colombo paper suggests a novel prize competition, viz. :—"That a prize of R100 be offered by the

COFFEE SHADE TREE.

Sun-dried Erythrina Lithosperma loppings, &c., contain per ton :—

61·50	lbs.	Nitrogen.
57·38	„	Potash.
14·92	„	Lime.
13·68	„	Phosphoric Acid.

Seed cured under Messrs. Sutton and Sons' advice.

Orders should be booked early for the 1898-1899 crop of seed from the parent trees of above analysis at Rs.6 per pound containing about 2,000 seeds. *Germination guaranteed.*

Only thornless variety extant, and is not procurable anywhere save from the

MANAGER, ARIENKOW ESTATE,
Shencottah.

Planters' Association for the best system of keeping a check-roll, both daily and monthly, by which coolies should be paid by the lb. of leaf they bring in." He remarks:—"Simplicity should be a leading feature in the system. An *unsigned* copy of each system to be sent to the Chairman of every District Association, and the prize to be awarded by their votes. Should they not consider any system perfect, no prize need be given. Competition open to all."

Florida Velvet Beans.

Mr. J. P. William writes to the *Ceylon Observer*:—The result of the Florida Velvet bean seeds planted at the above estate by me imported direct from Florida two weeks after your free distribution is now as follows:—Planted in rich soil, creeper 12 feet high and growing about 1 foot a day, flowers have appeared two feet from the ground up to 8 feet, throwing out many branch creepers. 2. Plants in gravelly soil 6 to 7 feet high, no flowers or branches yet. 3. Plants in sandy soil 3 to 5 feet high, no flowers or branches yet. Growth in gravelly soil about 4 to 6 inches and in sandy soil (moist) 3 to 4 inches, ditto (dry) 1½ to 2 inches a day.

The Consumption of Tea.

Capital remarks:—It is common experience that Indian teas go further in ordinary household use than do Chinese teas, the former making a much stronger infusion from a given weight of leaf than do the latter. It is pointed out by the Commissioners of Customs, in their report issued last month, that when, as in the past financial year, we find an increase in the use of the stronger article to the extent of over 7,000,000lb. and a decrease in the use of the weaker article to the extent of over 3,000,000lb., it is evident that the progress of consumption is even greater than is indicated by the mere numerical difference in the aggregate number of pounds cleared.

Rubber Trees.

Messrs. J. P. William and Bros., of Henaratgoda, Ceylon, have issued two very interesting "new product circulars:" No. 30, on *Hevea Brasiliensis* (Para Rubber), which is described as "a most profitable tree yielding rubber, oil and fodder;" and No. 31 on *Manihot Glaziovii* (Ceara or Manicoba Rubber). A great deal of very interesting information is given in condensed form, and planters will no doubt be grateful to Messrs. William and Bros. Should any of our readers express an interest in the subject of Rubber Trees, we shall be very pleased to deal with it at greater length. We say but little now, under the impression that few planters in the South are seriously experimenting with either of the trees now referred to.

Java Quinine.

The Bandoeng (Java) quinine factory has not been very successful with its recent shipment of quinine to Amsterdam. At the auction held there on 27th ultimo all the three hundred kilogrammes (say, 10,500 ounces) put up was bought in at 16 florins per kilogramme (about 9*d.* per oz.) Perhaps the China market may be tried next, for the Dutch Consul at Tientsin says quinine is one of those foreign medicines which have obtained a firm footing in China. He is not sure, however, whether the alkaloid is exported to China from the Dutch East Indies, but in any case there is a good outlook for it. As to packing, labelling, &c., inquiry is recommended of the leading import houses. The quantity imported at present is exceedingly small in proportion to the population.

A Simple Insecticide.

Indian Gardening quotes "Old Colonist," who draws attention in the *Australasian* to the tomato cure for the peach aphis. He says that by rubbing the stalks and leaves of the tomato upon the branches and stems of the infested peach-trees, the orchard of Mr. Fleming, of Flemington, was completely cleared of the pest. If an infusion of the tomato plant was made and sprayed on to the fruit-trees in the usual manner, equally good results would doubtless be obtained. Should the pest reappear, a second application should be given, and it is not unlikely that aphis on other trees and plants may be cleared in the same manner. Our Calcutta contemporary remarks:—"Tea and Coffee planters should make a note of this, especially in the case of scale, aphis and mealy bug."

Tea Infusion!

"The unremunerative prices obtained for tea throughout the season ought," writes a correspondent to the *I. P. G.*, "to induce planters to call in the assistance of the chemist in order to ascertain whether it may not be possible to send forward the ready-made infusion in casks or bottles. It is a well-known fact that the difficulty of creating a taste for Indian tea lies, firstly, in the absence of mixing the strong and weak together—blending; and, secondly, in the faulty method of concocting a brew or 'dish of tea,' as it was once designated. Liquid tea evolves mould or mildew, but so do other preserves, though in all cases a very small 'exhibition' of chemicals, as the chemists say, prevents this, and I see no reason why the same success should not attend the doctoring of tea."

The London Tea Market.

Reuter wires on 12th instant as follows:—"Market steady. Pekoes and pekoe souchongs firm and dearer for all kinds. Orange pekoe and broken pekoes rather irregular." Messrs. Gow, Wilson and Stanton telegraphed to Colombo on 13th instant:—The market generally is steady. Good liquoring Pekoes are in improving demand. The Market for poor liquoring teas is steady. The price of fair liquoring Ceylon Pekoe Souchong is 6½*d.* The average price of Ceylon Tea sold on Garden account this week was 8¾*d.* (¼*d.* up). Reuter reported on the same day:—*Ceylon Tea*:—Common qualities are irregular, and others remain firm. Packages offered 13,000; Packages sold 12,000; Fair Pekoe Souchong 5½*d.* (unchanged); Average of week 8¾*d.* (½*d.* up); *Indian*:—Packages offered 49,000; Packages sold 47,000; Average of Indian Tea 8¾*d.* (⅛*d.* down).

A Tea Problem.

"Coffee and Tea Planter" and one of his friends have been discussing a problem:—"Is it true that a great deal more money has been brought into Ceylon than has ever been or will ever be taken out of it; and that Ceylon owes its prosperity not to what the soil has produced, but to the constant influx of capital, a proportion of which is lost every year?" "C. and T. P." says that the Editor of the *Ceylon Observer* has been appointed umpire, and he accordingly writes that gentleman:—"It would be very interesting to know the extent of

the losses or profits in connection with coffee, cacao, cardamoms, cinchona and tea—of course crediting all cultivated area on the basis of the present profits. On which side would the balance be, think you?" The umpire rather cries off the cracking of the hard nut presented to him, saying, "We do not see how the necessary information as regards the estates of private proprietors is to be got, to enable any reliable reckoning to be made." He further remarks:—"The late R. B. Tytler made out after 40 years of coffee, and before the final crash came, that only 10 per cent. of all the planters he knew, from the practical beginning of the enterprise in 1837, had bettered themselves materially by coming to Ceylon." And then suggests:—"Let our two friends make a similar calculation for tea—only it is rather too soon to do so, until we see what the next few years are to bring about. One thing is certain: that whether there is a due return or not for all the capital introduced, all those dependent on tea in the island—coolies, artificers, cartmen, etc.—and the general revenue especially, benefit by its introduction. Every acre opened means employment for so many more people and so much more grist to the Government exchequer." The answer must be almost more discouraging to planters than the question.

LETTERS TO THE EDITOR.

LADY-BIRDS.

SIR,—My letter on the lady-bird in your issue of October 1st was simply to record the fact of the experience of a planter of Hawaii, who was very certain that it was the larvæ, and not the lady-bird, that eat the scale.

I do not dispute the fact that "Lady-Bird Junior" saw a lady-bird sucking in scale, but it seems odd that in Hawaii the lady-birds did not eat the scale, and they were supposed to have the right kind.

OLD PLANTER.

THE EXPORT DUTY ON BONES.

SIR,—In the report of the meeting of the U.P.A. held recently in Bangalore I note the President's remarks on the subject of the proposed duty on bones.

The President's explanation on the subject implies (quite unintentionally, I am sure) that responsibility attaches to me for the non-effect given to the resolution passed at the Annual Meeting in August, 1897. I beg to disclaim any responsibility in the matter.

I introduced the subject and said all I had to say in favour of the resolution, and was therefore unable, subsequently, to suggest any line of argument or arguments other than those advanced at the meeting and considered sufficient to gain the passing of the resolution.

FORELAND, ISLE OF ISLAY,
26*th Sept.*, 1898. O. SCOT-SKIRVING.

"GAINERS BY EXCHANGE."

SIR,—In your remarks on my article of October 8th you state that my remarks on the "balance of trade" are of a character "to provoke ridicule on the part of the modern school of political economy." I fail to see why you do not show the reason for the remark, and I would draw your attention to an article headed "Cheap Silver in Mexico," which appeared a few days ago in the *Madras Times*. The above article fully bears out all I have advanced; it says "Commerce ha not suffered as the purchasing power of the country has bee largely increased by the stimulus to exportation afforded by chea silver, and therefore cheap labour." In fact, the whole article full of facts, and I enclose it as you may care to print it.

From the general tenor of your remarks I gathered yo were averse to cheap silver. I may be mistaken. Of course I agre with you that the Permanent Settlement was a gigantic blunde and it is only a proof of the financial inability of the Governmen that it has not long ago devised a means of reaching the pocke of the Zemindars of Bengal. At the same time they do n represent all India.

I could not prove by figures that the country had gained lost by a high exchange, as I expressly stated that five years mu elapse before a balance could be struck, but the fact of Ind being thirty millions to the good before the raising of the valu of the rupee was in part a proof of India having gained unde a low exchange.

It is clear that Mexico has largely gained, and so should Ind if there was no forty per cent. duty on exports.

OBSERVER.

DISTRICTS BEST SUITED FOR TILLAGE WITH SALTPETRE.

SIR,—Nitrate of Potash (KNO_2) or saltpetre: I see l your journal an enterprising philanthropic planter under th *nom de plume* of "TODA" volunteers to prepare pans for the makin of nitrate of potash. It is to be hoped the good, hard working plan ers in coffee will give him all the support they can, since he h taken up the work in a most generous spirit. Such Coffee Com panies as are left by the Mercantile firms having coffee estate with ample money at their back, will show a little enterprise whic would be for the best interests for the staple that departme of their firms live on coffee. It should be borne in mind that saltpetre has a great affinity to moisture, it would be unwise use it on estates situate near the ghats, where there is a heav rainfall. In your Presidency the districts of Dindigul an "Trichy," owing to their intense heat and the dry winds the prevalent, cause the moisture in the land to be drawn to th surface, leaving it in some of the "bottoms" of level valleys to as a hoarfrost on the surface. In parts of Bengal, where th land is deeply impregnated with it, it lies very thick, giving wintry appearance to the part in the dry winters enjoyed by th favoured province, so that it will only be of benefit to coff districts having a light rainfall, as Kotagiri, Shevaroys, th eastern part of Coorg District and, northerly to it, the Provin of Mysore. All these good crop-bearing districts will be benefite by it; but even here the writer would presume to suggest that compost be made to hold this salt, which has such a tireson affinity to water, so that the compost acting as a vehicle may, the same time, so far hold it as that the spingiols at the ends the roots may have it placed so that they may obtain it.

It would, therefore, appear that it would be best applied as "top dressing" of a clayey mould or humus capable of giving to the part where it is required the full benefit of it. As estates with a heavy rainfall it would, it is to be feared, run on the first heavy showers,—some clever planter may devise "method." "Nitrate of Soda" occurs in immense quantities the southern extremity of Peru in the Province of Tarapaca, an incrustation or compact stratum several feet thick (!) in th Pampa of Tamarugel—an arid plain situated in a region whe rain never falls. The salt is dissolved in hot water, the solutio poured off from sand, and evaparated to the crystallizing poin the crude salt is of a yellow or reddish colour. From the shap of the crystals it has been called "cubic nitre;" it is also know as Chili saltpetre at home.*

* How Crops are fed, p. 252.—Prof. Johnston, M.A., Yale College.

It is extensively used in growing green crops; an Engineer friend, whose brother is a Scotch farmer, told me that its intense powers of fertilising the crop so drew the strength from the soil that when the field was laid afterward in vetches, the part where the firmer crop had been treated with nitrate of potash, the crop was very poor from the exhaustive effect on the soil. *Verbum sap.* One would presume to think it would greatly stimulate the tea plant, particularly as this stimulant acts on foliage. This might help the Ceylon Planters to face the continuance of the 1/4*d.* exchange, which one hopes will be permitted to be fixed at 1/3*d.*, though Sir Patrick Playfair's speech to the Bengal Tea Association looks as if London and the Import trade would have it all their own way. Coffee throve when exchange was 1*s.* 10*d.*!

I am glad to observe that the Geological Survey have confirmed my strong belief in the great advantage coffee has growing on a gneissic subsoil. The result of their excellent work in Coorg goes to prove that all the most prosperous estates lie in gneissic subsoils, or rock bed. To this fact, combined with a light rainfall, may be attributed the staying powers of the coffee trees on the Shevaroys.

21*st Sept.*, 1898. E. A. Quarme.

COFFEE ESTIMATES.

Sir,—In the leader in your issue of 8th October on the above-named subject you remark that "you would be placed under a lasting obligation if some one would explain the objections planters have to furnishing estimates. I think I can point out the chief of these. In the first place they dislike the inquisitorial nature of the proposal, and in this respect I would remind you that the coffee estates in Coorg and Mysore (and for the matter of that throughout S. India) belong for the most part to individuals and not to public companies. These latter, in order to satisfy their shareholders, and to keep them *au fait* with the progress of the concern, are bound to furnish information of various descriptions, among others estimates, but this is not so with the individual. There is no call upon him to make public his private affairs; unless distinct advantages are likely to accrue, he will not do so. The publishing of estimates, or actual outturns of crops, is more or less equivalent in a great many cases, at any rate to those who are in "the know," to a revelation of income, and it is needless to express how all the world over men, especially those whose means of subsistence are small, object to the extent of them becoming known. What a hubbub there would be if the members of the Madras Chamber of Commerce were asked to furnish estimates annually of their anticipated profits or losses! and yet it would be closely analogous to asking planters for crop estimates. Another objection is that bare figures are often very misleading. This is essentially true of the coffee-planting industry. In the different districts circumstances vary to an extent unknown except to the initiated, rendering comparison unfair and misleading unless the facts are also forthcoming. For instance, a certain estate, A, may be endowed with a richer soil and cheaper labour than B, which enables it to show a profitable return on a small crop. In other words, having to manure less owing to its richer soil, and to spend less on cultivation works owing to its cheaper labour, a 2½ cwt. per acre crop will give a profit, whereas B will require 4 cwt. to do so. Year in year out the estimates would probably preserve the same ratio, and if the bare figures without the attendant circumstances were published, they could not fail to have a prejudicial effect regarding the value of the property with the lower average, whereas this might actually be showing a higher profit. Planting properties in S. India not infrequently change hands, due probably to the influences of the climate resulting, alas! too often in premature death and breaking up of health. With the prospect of sale sooner or later in view, it is of paramount importance that nothing should transpire that would unduly prejudice the reputation of an estate. A bad name is easily created, and too great care cannot be taken in this respect. A risk would be run in providing estimates. It might be contended that if individuals do not care to furnish them, the Honorary Secretaries of District Associations might do so collectively, but though the "inquisitorial objection" would have less force, the other, viz., the misleading propensity of figures, would be equally cogent. Districts as well as individuals have their reputation to sustain, and those would be liable to be under-rated whose estimates compared unfavourably with their neighbours.

These then are the two main objections. What advantages can be put in the scale to outweigh them? You say truly that the Brazil crop regulates prices generally, but that an important increase or decrease in East Indian has some effect on the higher qualities. But the fact of publishing estimates would cut both ways, as expected decrease would cause an upward movement, and an increase the reverse, so that though planters would benefit one time, they would lose another. And after all the publication of estimates has only an anticipatory effect, the real regulation of prices is the actual production. At present the influence that East Indian Coffee has on the market is gauged by the actual deliveries, whereas if estimates ruled rates would be affected six months in advance. Would not a more speculative tendency be introduced resulting in an "arrival" business in E. I. Coffee? This would be of doubtful advantage to the producer. At one time prices would rule abnormally high, and another sink perhaps to a lower level than has been touched yet. A large arrival business is of course done in "Brazil," but as yet little in East Indian, and I feel assured that the planter would prefer the comparatively steady rates that now prevail.

Unless more solid advantages than these can be shown, estimates will not be forthcoming.

M.

COFFEE CROPS IN MYSORE.

Sir,—Although it is not my rule to reply promptly to questions which are asked in the public press and with which my name is associated, I entertain such profound respect for the Editor of the *Ceylon Observer* as one who has done yeoman's service for planters generally, that I venture most respectfully to point out that although the coffee crops on these estates and many others in Mysore have undoubtedly been less during the last five years than between 1883—88, the cause is attributable (and clearly proved to be so by carefully-kept registers) to faulty distribution of rainfall. It was my special duty and my earnest endeavour at the meeting of the U.P.A.S.I. to clear away for ever the idea that plant pests have been solely responsible for the diminished yield which has characterized the last five years in Southern India. The distribution of rainfall is far and away more important to agriculture generally than the actual quantity, and although it may be said that in regard

to Coffee, the great thing is to note how much rain falls in the locality between January and May, I would go farther and maintain that as the success or failure of a crop is entirely dependant on the blossoming of the trees, it is absolutely essential that the rainfall be properly distributed so as to produce properly developed bearing shoots and that rain must not be either in defect or excess during the critical period when the flower is maturing. I have heard of a grower of rare flowers in England having lost hundreds of pounds in a single day owing to faulty arrangements in the glass houses connected with maintenance of the requisite amount of heat, light and moisture. I regret to have to record the fact that I have lost many thousands of pounds during my life by the faulty distribution of rainfall during the blossoming of Coffee.

The most complete immunity from plant-pests or all the culture in the world will not prevent loss occurring if the rainfall is badly distributed at blossoming and other critical periods of the coffee plant's existence.

It is a well-known fact that during the last five years agriculture in India generally has suffered very serious losses. The question asked is a personal one. Mysore is a very large territory, and one of its peculiarities is the varieties of climatic conditions which are met with or experienced in localities situated only a few miles apart. I hope, therefore, that any general statements I may make may be understood mainly to apply to the estates within a few miles of those in which I am interested, even though I feel sure they also apply to many others which are situated in localities where the climatic conditions are identical with or nearly the same as those under which my experience has been obtained.

The great famine in Mysore in 1877 was caused simply by the failure of a few showers in September when the millet was about to throw up its fruit-stalk. In the same way, I hope, the following statement will clearly prove the principal reason of the coffee crops being small, not only on these estates but on many others in the years 1896, 1897 and 1898.

In 1896, after one of the hottest and driest seasons imaginable (nearly $5\frac{1}{2}$ months without a single drop of rain), a shower of 42 cents of rain fell on the 11th April and was followed two days afterwards by 9 cents. This fall was not followed up during the ten days which constitute the period in which the blossom is either matured or ruined. The effect on well-formed spike can readily be imagined.

In 1897, rain commenced, after a late crop and before "spike" was formed, on the 16th February, and 1·55 inches fell between that date and the 19th February, but this rain was not followed up until 15th April.

The result was a grand flush of early wood and no subsequent budforming.

In 1898, 4·28 inches of rain fell in eleven days in April, of which ·41 cents fell on the open blossom, and these showers were followed by 1·28 inches immediately after the blossom had matured.

The show of flower was the finest I have ever seen in my life, but a large percentage was ruined by the heavy rain interfering with fertilization.

A few estates which had favourable rains in March and early in April in all three years did very well and picked crops above their average. During this last season also, nearly all the estates in Northern Mysore had excellent rain in March to bring out their blossom, and it is the exception to hear of any of those properties doing badly.

During all the years between 1883—88 we had the most perfect blossom showers, and the crops were in the aggregate magnificent in spite of plant-pests and abnormally irregul aggregate rainfall.

No accurate deductions can be made except from an analy of the distribution of rainfall during the blossoming seas and the North-East Monsoon when the shoots, for the followi year are maturing.

The aggregate rainfall during 1896 and 1897 was 232·52 inch and produced two of the worst crops on record.

The aggregate rainfall during 1883 and 1887 was only 190 inches, and produced two of the best crops ever known.

The largest crop, which was in 1887, was produced by or 71·42 inches, and the worst crop ever known was in 1897, wi an aggregate of 105·47 inches of rainfall.

In conclusion, permit me to point out that there was only small amount of leaf-disease last year, and that this pest duri the last five years has not been nearly as bad as I have kno it to be in many previous years.

I would also desire to draw attention to the fact that t North-East Monsoon of this year is the best that has be experienced for fifteen years.

The finest North-East Monsoon was in 1883, the beginning the period during which good crops occurred.

The next best was in 1887, when the record crop was produc and was followed by a high average crop, which was m remarkable.

Far from not accepting Professor Marshall Ward's repo relative to the life-history of *Hemeleia vastatrix* as final, eve planter of any experience is quite satisfied that all that the m eminent cryptogamist could effect has been done by hi Lasting credit is due to him for his painstaking devotion to c interests.

His last words were to the effect that future investigati must be associated with the experimental investigation of t nutrition of plant cells, a subject which can only be studied in laboratory equipped to the highest possible standard of efficienc It is this investigation which I venture to hope may claim t first attention of experts in the near future.

Professor Marshall Ward also sounded a most excellent wo of warning when he impressed upon us the vital importance paying increased attention to methods and time of pruning a handling, so as to have such shoots on our trees as local e perience may have indicated as best fitted to withstand or ev resist the attacks of the pest. Where many practical plante differ from his opinions is simply in regard to the fact that t experience gained on many thousands of acres of coffee clear demonstrates that attention to the selection of seed and varie of coffee and the class of shade and its regulation; the use suitable manures, together with improved methods for mai taining proper physical condition of the soil, more especially associated with judicious pruning and handling; have one and a most decided tendency to mitigate the effects of the scourg Professor Marshall Ward's most excellent report, while in so places clearly supporting these facts, also contains the bone contention that the entire requirements of the fungoid parasi are a plentiful supply of healthy cell-sap and a little moistu which rightly or wrongly has been interpreted by many mean that nothing can be done to save us from the pest, a that in fact the more we work and the better heart we keep o trees in, the more attractions there will be for the pest.

I have been a planter for 36 years. Our estates have pr duced more crop since we entirely re-planted them with N Nad Coffee than they ever did even in the glorious seasons former years.

At this moment they are looking far finer than I have ev

MILLIE & REDMOND, late P. THOMPSON & CO., *Ootacamund, Engineers and Contractors.*

seen them do before, and consequently I humbly venture to say that I have every right to my cheerfulness.

Let us hope that your kind intention to watch the developments in Mysore may be rendered agreeable by the beneficial results of the present North-East Monsoon aided by a good distribution of rainfall at next blossoming.

I earnestly hope I may not be blamed for most cordially agreeing with you that systematic and persevering work are essential to success in all agricultural undertakings, and for believing that good distribution of rainfall at blossoming and also for the development of the proper class of good-bearing shoots are of vital and paramount importance in connection with all fruit-growing industries.

Barguai, Munzerabad, 18*th October*, 1898. } Graham Anderson.

THE DECLINE OF COFFEE DRINKING.

Although some medical authorities assert that coffee is an antiseptic and disinfectant and very effective in cases of typhoid, the general consumption of the berry in England does not increase. It will be seen from a reference to the customs' returns that coffee is still on the decline. This is due no doubt to the ease with which tea can be brewed by comparison, and the tremendous spurt made of late years by the wealthy firms engaged in pushing the sale of tea. Coffee is left to struggle on and live upon its ancient reputation—a reputation, by the way, held in affectionate regard by steady-going coffee drinkers, who resist all efforts to wean them from their beloved beverage.—*H. & C. News.*

THE QUALITY AND THE QUANTITY OF CEYLON TEA LEAF.

In the tea market, transactions have continued much as before, prices ebbing and flowing according to the character of the supplies. A correspondence has been going on exercising the minds of those immediately engaged in Ceylon Tea, as to the alleged deterioration from the time it rose to a staple article. There is no question but that large quantities are sent here that show a falling-off, especially in a season like the present, when such satisfactory prices have been obtainable for the fine China and Indian. The green leaf is capable of being made into a better-finished article, and the fault seems to lie in the manufacture during the early stages, large quantities of tea proving deficient in sap or body. Quality has been sacrificed to quantity.—*L. & C. Express*, Sept. 30th.

GREEN TEA.

A Planter writes:—In one of your back-issues you asked for information as to the amount of manufactured tea obtainable from green leaf. I have found, on an average, the following as the proportional weights. Green leaf 4lb.; after withering 3lb., after rolling 2½lb., after drying 1lb. The amount of moisture, therefore, dissipated after withering is 25 per cent., after rolling 40 per cent. In other words the roll contains 60 per cent. of moisture. But it would certainly seem that more moisture ought to be dissipated in the drying than in the withering and rolling,—doubts on this point can only be settled by direct experiments. Probably it will be found that, on an average, the roll contains $66\frac{2}{3}$ per cent. moisture, and that this is the amount dissipated in the drying process, $33\frac{1}{3}$ per cent. only being dissipated in the withering and rolling process instead of 40 per cent. The percentage will, of course, vary according to the leaf and the state of the weather. It is, therefore, very difficult to arrive at exact figures, but a practically correct average could be obtained.—*Planter.*

A GIGANTIC FLOWER.

The *Planter* says: A correspondent from the Central Provinces writes:—It may be interesting to the readers of the *Planter* to know that there is at the present time a creeper in the "Maharaj Bagh" Gardens of Nagpur, in the Central Provinces, the flower of which is four feet six inches in length, from the extremity of branch to end of flower, which terminates in a pendulous cord-like tail. The girth of the flower measures about nine inches, and in colour is a purplish green. Its shape is that of two bags attached together lengthways of a network appearance inflated at either end of the body and contracted in the centre. The limb is large, and, as before mentioned, the whole terminates in a long tail. The smell of the flower is very offensive and strong, and attracts large numbers of flies which enter the flower, but once inside cannot extricate themselves. The botanical name for the plant is "Aristolochia gigas," and is of the Sturitrauti family of creeping plants. It is a native of Guatemala. Great numbers of people daily visit the gardens to see this extraordinary freak of nature, mostly from curiosity, some to add to their knowledge of the science of botany. It is certainly a rare production of the botanical world, which is sure to be a little more than a nine days wonder.

TEA AND COFFEE SHOPS.

We learn, writes the *Financial News*, that informal conferences have taken place among various people interested in businesses of the class likely to be affected by Sir Thomas Lipton's cost-price refreshment shops scheme, and that as a result, a working arrangement antagonistic to Lipton's is very likely to be arrived at if Sir Thomas Lipton's scheme should come to realisation.

At present, the idea is to follow up the opening of Sir Thomas Lipton's refreshment shops by commencing to sell tea and coffee at, or even considerably under, cost price at the various depôts of the refreshment companies concerned. These run to hundreds in London alone, and it is believed that Lipton's trade would be considerably diminished, by this means. It is stated, however, that some of the larger tea companies have been approached, and have signified their willingness to give every assistance in the development of this scheme, if it should be necessary to carry it as far as the establishment of rival shops to Lipton's. Some of the larger tea companies claim to have a considerably more extensive area of tea lands in Ceylon than are possessed by Liptons, and they are inclined to believe that it might be to their interest to co-operate with the refreshment companies in taking the present opportunity of damaging Lipton's business.

A TEA PRUNING EXPERIMENT AND ITS RESULTS.

Writing under date Roseneath, 4th October, 1898, "J. L. D." sends to the *Ceylon Observer* a paper entitled as above. The *Observer* states that the paper must be regarded as of permanent value in giving a faithful report of actual experience in regard to the pruning of tea grown at a medium elevation and in an old coffee district. It adds:—"Roseneath, the plantation referred to, grew coffee, we suppose, for nearly 40 years before its fields were turned into tea. The property is now to be taken over by the Kandy Municipality to be gradually turned into a forest with quick-growing trees and added to the reservation around the water-supply reservoir for the town. The Manager of Roseneath takes charge of his own tea estate in the Knuckles: but before leaving he has been good enough to place

before us his experience of a system of pruning which some authorities would consider too frequent in its operation if not too severe."

J. L. D's remarks are as follows:—When I last had the pleasure to see you, Mr. Editor, we had a talk about tea pruning. I told you of my experiment here and the results; and now that this property is changing hands—passing to the Kandy Municipal Council—and my connection with it ceasing, it might be well to put on record what has been done, and the outcome so far. For those who do not know the estate I may say that part of it might have been opened fifty years ago; that for the first twenty years there were few or no drains: that it has a poor quartz hungry soil, and but for the liberal and enlightened policy of its proprietors who have always allowed steady manuring, it would long ago have lapsed into thin scrub or weakly managrass. It has been kept alive and going by Kandy rubbish, and now that this savoury fertilizer is to go elsewhere, and the tea now growing is to work out its own destiny unaided, I expect it will be short-lived. The "City Fathers" have taken the property to their bosom—a dignified and hallowed resting place! What I have done in the way of pruning is what I hold will help similarly situated estates, medium elevation 2,400 feet with old coffee land, undistinctive teas, and low yields. There are numerous properties of this kind—"bound to go to the wall" so it is said—and it is to prevent if possible this heart-breaking process, by showing a way to a considerable saving in working, that I send you what has been done here.

I used to prune my tea every 18 months. In 1894 I had come down to 15 months. Since the beginning of 1895 the whole estate has been pruned yearly. The daily averages of leaf gathered per cooly for these years are as follows:—

1894	pruning every	15	months	...	lb. 15·09
1895	do	12	do	...	„ 17·00
1896	do	12	do	...	„ 20·09
1897	do	12	do	...	„ 21·01

This makes cheap working. I may say I went round every 10 days. What was beginning to impress me most was *the steadiness and regularity of the flush*—no big rushes and no lean months. In 1897, the months which were under 20 lb. average were January 18·09 and August 19·09; the two highest were April 22·07; November 22·04.

The pruning was a light pruning costing rather less than R.4 an acre. I had a small gang of experts who did little else. Supplied with decent knives they finished their task by 3 P.M. I found that after pruning I had to tip for the first time in about two months.

The teas made got fair prices, considering the medium plucking and the elevation. Last year, for instance, the average for the *whole* crop sold was 34¾ cents.

I have often been told that I would ruin my tea by the plan I have adopted. It is possible; but who has the experience to speak, and on what other authority are they entitled to speak? Why should 18 months' pruning be considered safe and 12 months' unsafe? It's a thing that has to be tested. How was the man regarded who first advocated and applied the knife vigorously to roses? Is it not an axiom in grape-growing countries that you should never prune your own vine; but get another to do it, that the plant may get the thorough treatment it needs?

Anyhow if the medium properties are "bound to go to the wall," as some of them are being worked at present, might they not go in *on the chance* of surviving the yearly pruning, lesson their cost of production, and give a wider field for generalizing on the merits and effects of quick and light pruning? Better to die with the old pluck at the fore, and ready to grasp at every advantage before the fatal plunge is taken, than doing nothing, or at best a hum-drum following of the leader to possible disaster. I have seen numbers of places where the returns were short—the plucking average too low for anything—and the leaf gathered, bangy abomination most of it—which with an earlier application of the knife would have done ever so much better.

I don't claim all the advantage to the pruning: it produced the leaf, but it had to be plucked and I was blessed with a really hard-working lot of coolies and an exceptionally energetic Conductor to run them. *He* takes a lot of the credit, classes himself in a new order of merit, that of being *not* "a half-past six feller." which I presume stands for up-to-date with us. Doubtless there is also a hidden allusion to the lazy cooly late for muster. The manuring too has played a part, but I generally think of that as only bring up the soil which obtains here, to a fair average elsewhere.

BRAZIL COFFEE.

A SLOW but wholesome change has been going on in this bra of the coffee trade since the early part of the year, says the *Grocer*, prospects for holders are far brighter than they were then. Aft long spell of depression, during which the outlook for the comm sorts of coffee was described by some importers as "deplorabl the market has acquired more stability, the dreary period of c stant "sagging" is believed to have come to an end, and the mon of superabundant supplies and unexampled low prices seem length to have passed, for the present at least. The original cal lations of the entire Brazil crop for 1897-98, ventured upon th years ago, and duly notified in these columns, have proved to remarkably correct, and what at one time appeared to be an ex gerated estimate, viz., about 10,000,000 bags, has been actu realised. That this is so is shown by the fact that, at the term tion of the season on June 30 last, the aggregate shipment Brazil coffee to Europe, the United States, and elsewhere, amoun to 10,569,000 bags, against 8,680,000 bags in 1896-97 and o 5,489,000 bags in the twelve months ended in 1895-96. Compar the separate imports of Rio and Santos coffee from the Brazils 1897-98 with those in the previous season, we find that 4,516, bags consisted of the former description, as against 3,579,000 b in 1896-97; and also that 6,053,000 bags were composed of the lat kind, in contrast with 5,101,000 bags shipped from thence dur the year before.
